5. Mahalo for your recommendation to build a new road on pilings that would move outwards from the cliffs. Both the existing highway and Hā'ena Archaeological Complex, which covers the park area makai of the highway from Limahuli Stream to Kē'ē, are listed on the National Register of Historic Places and the Hā'ena Archaeological Complex is also listed on the State of Hawai'i Register of Historic Places. Your recommendation would significantly impact both of these historic resources and would be costly to construct. This alternative for rockfall mitigation is vetted in the Rockfall Study attached as Appendix B to the EIS as Design Alternative 6 and estimated to cost roughly \$15.5 million. Both the impacts to the historic sites and high construction cost deterred the project team from selecting this option. The Pedestrian Path located outside of the modeled rockfall hazard is the preferred route to Kē'ē. However, warning signs are proposed to be posted on the gate at the highway to advise people of the risk of the rockfall hazard should they decide to continue on the highway towards Kē'ē.

The email exchanges between us on September 2, 2015 are also included in the Final EIS. The questions you ask after the exchange refer to how the proposed visitor limit would be implemented, which has been revised in the EIS and attached in the "Visitor Limit" attachment.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at:

[http://oeq2.doh.hawaii.gov/EA\\_EIS\\_Library/2018--KA-FEIS-Haena-State-Park-Master-Plan.pdf](http://oeq2.doh.hawaii.gov/EA_EIS_Library/2018--KA-FEIS-Haena-State-Park-Master-Plan.pdf) on May 25, 2018

Dear Ms. Tanaka and Ms. Yuen:

**SUBJECT: Ha'ena State Park Master Plan**

First, we are aware that many people in the community find the sheer size of the plan document daunting. A truly thorough review takes time and many seem to feel the comment period should be extended.

We agree with this sentiment as we would prefer to be able to invest some time in reviewing the document, which is simply not possible within the time frame provided. An extension of the comment period is also justified by the complexity of the plan, which in fact appears to include variations of the actual plan. Some of the more voluminous ancillary sections might have been better placed in a companion volume so the actual plan could be the focus of public review. The electronic version of the plan is among the least user-friendly publications we have ever encountered.

It's true that the planning process has been conducted openly and has included opportunities for public review and comment. But the version at hand as the supposed final plan invites scrutiny from a broader audience than may not have been able to focus on it previously. Under the circumstances, an extension of the comment period of at least 90 days is desirable.

But since you may not extend the deadline, here are our observations:

- 1) The plan's broad objectives of establishing user regulations to mitigate environmental damage done to the park's ecosystems by visitors over the years are justified and—to a large degree—well-reasoned.
- 2) That said, the plan has understandably raised concerns within the community that local people will encounter serious obstacles to using the park, which the plan in some respects sidesteps with observations like: "However, with implementation of the visitor limit and management objectives of this master plan, the hope by the local community is that there will be an increase in park use by residents as a place of employment, for volunteer projects and community work days, for cultural practices or simply to enjoy the park's resources and facilities."

Many readers of this document, no doubt will find that observation inconsistent with much of the rest of the plan since it includes numerous elements that would severely limit the ability of local residents to access and enjoy the park.

The plan does not focus much on operating hours, which provokes fundamental questions. If the visitor limit of 900 people is reached a 3 p.m., for example, do you really intend to bar residents—and visitors—

Page 2  
September 7, 2015  
Letter to Lauren Tanaka & Kim Yuen

from the park? Another unanswered issue is the extent to which the existing parking capacity is occupied by overnight vehicles associated with Kalalau Trail campers. The plan does not address ways to control parking for what amounts to dead storage while campers are on the trail.

- 3) The plan fails to address issues relating to enforcement of hiking permit requirements. In fact, the plan document is silent on an issue that could be seen as the elephant in the room: As envisioned, extensive staffing requirements will be required to operate the park in stark contrast to the current status of no permanent staff. Even with an entry fee (an issue of enormous sensitivity for locals) and parking fees it is difficult to imagine that the state will actually mount the resources necessary to make the park work.
- 4) The remote parking and shuttle issues are serious bones of contention. Does the plan actually think local people will drive to Princeville and board a shuttle to get to Ke'e? The plan suggests that shuttle fares would have to exceed \$10 per person to cover operating costs, a figure that would place visiting the park economically out of reach of many Kauai residents. The county's recent disappointing experience with the North Shore Shuttle raises serious questions about whether this transportation modality would be affordable and sustainable. Would surfboards or diving gear be accommodated on the shuttle? Would the shuttle actually operate late enough in the day to accommodate post-sunset departures at 7 p.m. or 8 p.m.?
- 5) Throughout the plan, despite repeated references to a "Princeville parking area," no description is offered that shows how such a facility would be developed. It is our understanding that aside from the fire/police building, a major development in Princeville by the Discovery Land Company is in the permitting stage. The plan implies that the management of Princeville would cooperate in developing such a parking lot, possibly at the Princeville Shopping Center. That facility is notoriously short of parking in its existing configuration; the center was recently purchased by the parent company of Foodland, which has signaled its intention to expand its operations on the site. The plan, essentially, glosses over the Princeville parking area, seeming to presume it would simply materialize. The plan provides no rational for this belief. Is a memorandum of understanding available?
- 6) The plan is silent on ending the periodic tension between the county and the state over extending the authorization for county lifeguards to work in a state park. The plan would increase the infrastructure of the state park, making it more important than ever to reach a permanent resolution of the authorization of county lifeguards to patrol Ke'e beach. The plan ignores this issue.
- 8) Other local residents have expressed hope that the remote Princeville parking lot could become a means of limiting vehicle traffic by tourists to the entire North Shore from Hanalei to Ke'e. Such an approach must be managed cautiously, as tourism is the engine of Kauai's economy. If visitors feel that they are being treated as an invader, tourism and all of the elements it serves on the North Shore—restaurants, shops and accommodation—could be seriously impacted.
- 9) The plan envisions a mandatory orientation for all park visitors. Frankly, this sounds overly regimented. As is the case at the Kilauea Lighthouse, for example, people may choose orientation, but should not be required to do so as a condition of admission. This objective is simply unrealistic and should be abandoned. Better to incentivize participation by offering different price points, giving a discount to those who take the orientation.

Allan: [aparachini@parachinigroup.com](mailto:aparachini@parachinigroup.com) voice/text: 626-676-5329 home: 808-320-3853

September 7, 2015  
Letter to Lauren Tanaka & Kimi Yuen

10) No doubt visitor traffic toward Ke'e would cause even more congestion at Ha'ena Beach Park (Tunnels), further congesting Kuhio Highway and causing even more conflict over parking on roads near the park. A reasonable person could infer the plan envisions is a unified, restricted access complex incorporating county and state park operations. This would be a very hard pill for local residents to swallow. Because numerous private homes are located near Ha'ena Beach Park, moving an entry gate near there would not seem viable, not to mention the conflict that might ensue between state and county park operations.

11) Because it is possible to hike to Ha'ena State Park from the Ha'ena Beach Park, does the plan envision some kind of law enforcement presence to intercept and exclude people using this route? In fact, so many restrictions are proposed in the master plan that it is difficult to believe that a round-the clock law enforcement presence would be required. Many local people fear regulatory overreach that is inconsistent with Kauai's lifestyle.

12) The notion that federal requirements for equal access for local residents and visitors can be skirted with a wink and a nod by creating a volunteer support group is both transparent and unworkable. Much more effort must be invested in ways to better guarantee access for local people. This is the only major failure we see in the approach followed to get us to this point.

This letter has been written in haste to comply with the Sept. 8, 2015 deadline. It is nearly certain that issues of significance are not addressed in this letter simply because there has not been time for a truly close review of this process requires. We hope you will extend the comment period, but if you will not, please accept the observations above in the constructive spirit with which they are intended. We would like to have an opportunity to discuss possible solutions to the concerns we have outlined. Please feel free to be in touch with any questions.

Sincerely,

*Allan Parachini*

Month XX, 2018 - DRAFT

Mr. Allan Parachini & Ms. Gina Lobaco  
2319 Kamali Street  
Kilauea, HI 96754

**SUBJECT: COMMENTS ON THE HA'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HA'ENA, KAUAI, HAWAII**

Aloha Mr. Parachini and Ms. Lobaco,

Mahalo nui for your emailed comment dated September 6, 2015 regarding the Ha'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawaii's Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Ha'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your comment regarding the length of the EIS comment period. The official 45-day public comment period on the DEIS began on July 23, 2015 and ended on September 8, 2015. However, State Parks held a public meeting on August 19, 2015 to gather more input on the DEIS and extended the DEIS public comment period until October 8, 2015. Comments on the DEIS received during this public comment period and the responses to the comments are incorporated in this FEIS and copies of those letters are included in EIS Section 13.0.

We also recognize your concerns as numbered per your letter:

1. Mahalo for supporting the protection and preservation aspects of the master plan that mitigate potential damage to the park's environmental resources.
2. We recognize your concerns regarding resident access to the park in relation to the proposed master plan. The revised master plan proposes the 900-person visitor limit as an initial number which can be adaptively managed and adjusted as appropriate, especially if there continues to be unwanted impacts at the park. If there continue to be issues, State Parks will work with the advisory committees on adjusting the number. As the State has more time to analyze user patterns, other options can be explored over time, and they are actively engaged in discussions regarding parking enforcement and increased fines along the roadway outside of the park as well. The visitor limits previously mentioned as a part of the park's adaptive management approach will be instituted only during peak hours of park use and will allow visitors to enter before and after peak hours without being counted against the visitor limit. Also, entry fees for state parks are established by Hawai'i Administrative Rules (HAR) 13-146-6, which states that Hawai'i residents are exempt from paying park entry fees if they can show a valid Hawai'i ID. Other categories of fee exempt park users, such as registered volunteers, may be established at a later time.

printed on recycled paper

Please see the "Visitor Limits" attachment from Section 2.5.4.3 of the Final EIS, which shows the verbatim changes from the Draft EIS for this section.

3. We recognize your concerns regarding enforcement of permits and budgeting for staff in the park. The timing of implementation of the proposed Master Plan is subject to CIP budget requests submitted by State Parks and approvals granted by the State Legislature. Therefore, it is not clear exactly when the proposed improvements will be made. Therefore, the Near-Term Plan described in EIS Section 2.5.1 will help State Parks implement some of the key management strategies with less funding, while funding is sought for the more extensive long-term improvements.
4. We recognize your concerns regarding a proposed third-party shuttle service. A proposed third party shuttle service has been analyzed as a part of the project's traffic impact assessment report, included in the EIS as Appendix F. The preferred scenario is to implement a third party shuttle from the Princeville facility at the start of Phase I, minimizing the need for visitor parking in the parking lot in the park. Please see the "Shuttle Service" attachment from Section 4.3.3 of the Final EIS, which shows the verbatim changes from the Draft EIS for this section.
5. We recognize your concern regarding the reference to the phrase "Princeville parking area". This reference has been removed from the one sentence it was located previously. The updated Section 1.9.8 of the Final EIS, with the verbatim changes as shown:  

"The main unresolved issues involve the shuttle service and the timing of implementation. For the preferred shuttle service described in Section 6.4.2.4, it is not clear whether the a third-party operator currently providing service to the park will continue provide the service or if State Parks or some other a government agency or combination of public agencies such as the County or USFWS will solicit a concession agreement or will start a similar service to serve the North Shore areas between the park and Princeville as has been requested by many community members in response to this project, that can serve the park from the remote Princeville parking area."

6. We recognize your comment regarding lifeguards in the park. The Hā'ena master plan has included County lifeguards throughout the outreach process, and will continue coordination regarding facilities and visitor volume needs as a part of continued inter-agency coordination efforts.

A new permanent location for the lifeguard tower has been identified with input from the Master Plan Advisory Committee and the Kē'e lifeguards. It is roughly 50 feet north of the highway pavement and 50 feet mauka of the 2009 certified shoreline to allow views from the end of the path to open up to the ocean and improve visibility for the lifeguards. When asked, the lifeguards agreed the proposed site will improve their ability to see key areas of the lagoon and Kē'e Channel compared to their current temporary location at the end of the highway pavement.

The overall employment at the park is recommended to be increased in other areas or may shift the requirements for lifeguards to the County beach park, which will help offset the loss.

8. We recognize your comment regarding the Princeville parking lot. The master plan will take a measured, cautious approach to parking and access through an adaptive management strategy.
9. We recognize your comment regarding education for park visitors. The mandatory orientation was discussed in a previous draft of the EIS, however, the revised master plan has removed this mandatory orientation and proposes all visitors be provided with park rules and information prior to entering the park. The orientation information could be made available on the State Parks website or tied to ticket purchase, particularly if advanced reservations become a requirement in the future. The orientation session would educate visitors on appropriate recreational activities and behavior, safety precautions as well as sensitivity to natural and cultural resources and to cultural activities that may be occurring in the park. In addition, emails could be distributed to park visitors prior to entry to inform them of safety precautions and updates on any special events or weather conditions. Additional information should be posted online or at the Welcome Hale. The Cultural Advisory Group should be consulted on appropriate cultural information to be included in the orientation session. Please see the "Visitor Orientation" attachment from Section 2.5.4.5 of the Final EIS, which shows the verbatim changes from the Draft EIS for this section.
10. We recognize your concerns regarding the impact of traffic on other parks in the north shore area. We recognize negative effects of the master plan may include the distribution of recreational demand to other facilities on the North Shore and island-wide, especially the nearby Hā'ena Beach Park. State Parks should monitor use of Hā'ena County Park to judge if the recreational demand is shifted from one facility to the other. If so, an adjustment to the number of visitors allowed per day to Hā'ena State Park might be considered as a mitigating measure. If a shuttle is employed, a mitigation measure may be to include a stop at Hā'ena Beach Park to alleviate traffic and congestion at the County park as well.
11. We recognize your concerns regarding hiking access from Hā'ena State Park to Hā'ena Beach Park. While currently there are no plans to limit hiking access via Hā'ena Beach Park, the master plan incorporates adaptive management strategies that can adjust access protocol based upon demand and amount of visitors.
12. We recognize your concerns regarding equal access for local residents and visitors. Entry fees for state parks are established by Hawai'i Administrative Rules (HAR) 13-146-6, which states that Hawai'i residents are exempt from paying park entry fees if they can show a valid Hawai'i ID. Other categories of fee exempt park users, such as registered volunteers, may be established at a later time.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oeq2.doh.hawaii.gov/EA\\_EIS\\_Library/2018--KA-FEIS-Haena-State-Park-Master-Plan.pdf](http://oeq2.doh.hawaii.gov/EA_EIS_Library/2018--KA-FEIS-Haena-State-Park-Master-Plan.pdf) on 2018.

Aloha,

Kimi Mikami Yuen, LEED AP BD+C

**From:** NaPali Kayak <kauaiadventures@yahoo.com>  
**Sent:** Monday, September 07, 2015 9:45 PM  
**To:** Kimi Yuen  
**Cc:** NaPali Kayak  
**Subject:** Na Pali Kayak request 8/7

Aloha Lauren and Kimi,

Thank you for taking time to submit my request.

My name is Joshua Comstock co-owner of Na Pali Kayak along side Ivan Slack.  
We run kayak tours along Na Pali coast Late April - early October.

As you know, there are three company's that are permitted to operate kayak tours; Na Pali Kayak, Outfitters Kauai and Kayak Kauai. All three companies use similar SOP's (standard operating procedures) and one of the most important is access to Ke'e. After we launch our tour from Haena beach park (Maninilolo) bay approx 7:30 am, the driver shuttles to Ke'e to make VHF radio contact with one of the guides. If at that time any of the paddlers wish to leave the tour, usually do to seasickness or other issues, the guide will then safely escort them into Ke'e lagoon and return to the group. At this time the driver will load the Kayak and take them back to their car at Na Pali Kayak headquarters. Since Outfitters and Kayak Kauai shuttle from the south shore and east side, we have staggered launch times. I think its safe to say all three companies have passed Ke'e by 10:30 am

This has been a key safety procedure we have followed for over 20 years and takes only minutes.

To continue running our tour as safely as possible and prevent possible emergency situations we request continued access to Ke'e beach and lagoon.

If you have any questions please feel free to call.

Mahalo again for your time,  
I understand you are very busy but will you please provide a written response?  
Thank you,

Sincerely,

Joshua Comstock, Owner, Lead guide

**SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUAI, HAWAII**

Aloha Mr. Comstock,

Mahalo nui for your emailed comment dated September 7, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We appreciate your comments describing standard operating procedure for your company and the other ocean kayak tour companies. Emergency landings at Kē'ē will continue to be allowed. However, please note that the highway between the entry turnaround and Kē'ē is recommended to be closed to general traffic so coordination with State Parks on emergency access will be required but is not anticipated to affect your procedures during these emergencies situations.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oeqc2.doh.hawaii.gov/EA\\_EIS\\_Library/2018-\\_-KA-FEIS-Haena-State-Park-Master-Plan.pdf](http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2018-_-KA-FEIS-Haena-State-Park-Master-Plan.pdf) on 11/15/2018.

Aloha,

Kimi Mikami Yuen, LEED AP BD+C  
Principal

**Subject:** Comment in opposition to Haena State Park Master Plan

A document of over 800 pages, years in the making and the DLNR provides 3 day notice of public meeting in school cafeteria facilitated by a presenter with a bullhorn. If nothing else, DLNR needs to extend the comment period and provide additional public meetings with real concrete information to share.

Our immediate concern is the fact that too many people with too little respect have over run the end of the road. For years this has been the responsibility of DLNR and they have made no attempt to correct it and now have a plan to limit visitors to 900 a day. But the reality is that there is no concrete working plan for this limit. If you shut down access where do you think they are going to go? The area from Ke'e to Haena will be log jammed with cars and people waiting to get into the park or parking in driveways and front yards of residence and walking in.

We are amazed that no attempt has been made to ticket the cars that are parked illegally in and surrounding the park. Throughout the report it mentions illegally parked cars. If cars were consistently ticketed for illegally parking, word will quickly get out and self regulation would occur. Parking regulations and speed limits need to be enforced throughout the area including Haena. With little respect or enforcement of current regulations, this plan has low expectation for success.

**Subject:** Comment in opposition to Haena State Park ~ building of structures

Ke'e is known for its beautiful scenic natural and cultural experience. The moment DNLR begins building structures, it will forever change the landscape. Million of dollars in physical structures should not be part of the master plan. People come here to take in the ocean, sky, mountain and the land. DLNR will change the entire serene area they are charged to protect and enhance. Absolutely there should be no concessions allowed in this area!

SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN DRAFT ENVIRONMENTAL  
IMPACT STATEMENT (EIS), HĀ'ENA, KAUA'I, HAWAII

Month XX, 2018

Page 2

impacts on neighboring beaches as you mentioned.

The proposed visitor limits will also be instituted only during peak hours of park use and will allow visitors to enter before and after without being counted against the visitor limit. Therefore, access will be allowed into the park outside those peak hours and will be adjusted as appropriate based on ongoing input from the community. Please see the attached Section 2.5.4.3 from the Final EIS on the revised visitor limit proposal.

We also acknowledge your concerns regarding parking enforcement and illegal parking not being enforced previously as well as your comment that proper regulation will be required for successful implementation. The revised master plan includes several parking improvements for enforcement, as well as park entry design with a turnaround to mitigate congestion. The new main parking lot expansion is intended to alleviate the strain on current parking demand along with facilities designed to support the recommended shuttle service. More details on the proposed park entry and parking improvements are attached in Section 2.5.1.1 and Section 2.5.1.2 from the Final EIS.

In response to your second emailed comment, we recognize your desire to preserve the natural state of the park and concerns with the originally proposed buildings and structures. The revised master plan includes significant changes and minimal physical improvements to preserve the natural beauty of the park. Most of the proposed buildings, including the visitor center, boardwalk, concessions and caretaker's cottage, have been removed in the revised master plan. Please also note that the educational structure has been revised to replicate a traditional hale, which will provide educational information to the public. The proposed hale includes a traditional design with no walls to replicate culturally appropriate structures. The master plan includes several aspects to restore the natural environment of the park as well. The attached Section 2.5.1.3 describing the Welcome Hale in more detail. Please also see the Master Plan Summary and Figure 1 from the Final EIS attached for reference with an overview of the revisions to the plan.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at <http://oeqc2.doh.hawaii.gov/EA-EIS-Library/2018-KA-EIS-Haena-State-Park-Master-Plan.pdf> on 2018.

Aloha,

Kimi Mikami Yuen, LEED AP BD+C  
Principal

SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUA'I, HAWAII

Aloha Mr. and Ms. Stevenson,

Mahalo nui for your two emailed comments dated September 7, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

In response to your first emailed comment, we recognize your concern that there was an inadequate notice period for the public meeting and request for additional feedback from the community. We also acknowledge your comment that previous management of the area was perceived to be disrespectful. The planning process for the Hā'ena State Park Master Plan involved a collaborative approach to support the development of the plan by consulting various local community groups and individuals, including a thirty-two member Master Plan Advisory Committee (MPAC) consisting of Hā'ena kūpuna and 'ohana members, cultural practitioners and scientific experts, business representatives, State and County agencies, and other North Shore community members to provide recommendations on the physical plan and park management.

The environmental review process has also included opportunities for public comment throughout the process. As you are aware, State Parks also held a public meeting on August 19, 2015 to gather more input and extended the Draft EIS public comment period to allow more time for feedback from the community before revising the master plan. Please see the attached Section 1.6 and Section 1.7 from the Final EIS describing community engagement and environmental review process. One of the key management recommendations is to establish a permanent Cultural Advisory Group and Community Advisory Committee. These are outlined in the attached Section 2.5.4.2 of the Final EIS with verbatim description of these groups.

We recognize your concerns with the potential impact on neighboring communities and beaches with proposed visitor limits causing congestion. The revised master plan proposes the 900-person visitor limit as an initial number which can be adaptively managed and adjusted as appropriate, especially if there continues to be unwanted impacts at the park and surrounding community. If there continue to be issues, State Parks will work with the advisory committee on adjusting the number and will also be conscious of unintended

Welcome Hale

**Date:** Mon, 7 Sep 2015 17:18:26 -1000

My mailing address is PO Box 293 Hanalei, HI 976714 - it was strongly requested to include a mailing address when commenting about this master plan. I would appreciate an email or letter back acknowledging your receipt of this letter.

I have lived in Hawaii almost all of my life, the last 30 years on Kauai, specifically in Ha'ena and Wainiha. I have a love affair with the north shore of this island and there is no other place I call home. I spend every possible precious free moment hiking, biking, kayaking, swimming, surfing, walking on the beach, watching sunset, moonrise, moonset and the stars on a clear night. Much of this is dependent upon access to Ke'e as it is now.

We have to be careful to make sure that the park does not end up being just or even primarily for visitors, without regard to the people who live here. Especially as access to so many other hikes, waterfalls, etc are being closed off one at a time for one reason or another whether it be a private dishonest owner just arriving from the mainland with different ideas from the way we live and think here, the state closing access because some mainland visitor once got hurt there, or just the fact that there is no parking or the trail or area is overrun by tourists so it's not longer inviting nor is there room for local residents.

I sometimes go the end of the road late at night for the special orange moonsets as it drops into the ocean. If the road is gated, this experience, too, gets robbed from us north shore residents, unless we drive for a minimum of 2 hours to the other side of the island to see it. Yeah, right.

This location is crucial for launching and/or landing kayaks for paddles along the coast, which I also enjoy as frequently as possible in the summer months. If we use any other beach further up the coast safety becomes an issue. The extra distance needed to be covered allows for more exposure time in the changeable elements. Someone could get tired, make poor judgements, the wind can get stronger and the waves get bigger. As it is now, it can be quite safe to launch and land at the end of the road and make for an enjoyable trip to and/or from.

Something clearly needs to be done about the congestion of rental cars at the end of the road. Particularly since we continue to advertise to the world inviting them to come, keep bringing more cars for them to drive around on roads that are already filled with cars beyond capacity and let them find parking where there is none. All the while the county/state puts up more cones, rocks and plastic pillars to block off what little parking is available.

Then there are the local residents who can no longer enjoy these places since they are overcrowded. I know my lifestyle has been severely altered by this situation; I feel as if I am being squeezed out like a toothpaste tube full of tourists and regulations.

As for the proposed state project, **it doesn't really matter whether anyone approves or disapproves of it unless there is some sort of shuttle.** This is the cornerstone yet there was no mention of any plan to implement any type of shuttle aside from a comment something like "the local community will have to figure something out."

Limiting the number of hikers on the trail is not the important issue. The major problem is the number of cars congesting the area from the end of the road all the way to Ha'ena Beach Park. The trail can handle the people more than the area can handle the cars.

How exactly do we limit the visitors on the trail, many of whom come to Kauai primarily to walk the famous Na Pali trail. Do they have to reserve a spot a year in advance? What about rain checks for trail closures once they have taken vacation time off work and paid for their airfare and hotel? Do they pay for these rights to hike? What if they cancel? Do they come to the end of the road intending to hike (of course everyone will arrive earlier and earlier like they do now for parking) and then find out whether the allowable amount has been exceeded?

Then, of course, the local residents. When we have time to hike, or want to hike on an unexpected day off, we just go and if it is already full we go home? Do we book a hike months or a year in advance, competing with visitors who are planning their vacations a year in advance? Again, I have been hiking the trail for 30 years on impulse, whenever I have a break from work, when I need some exercise close to home when I can bike to the trail head, or take advantage of a gorgeous early morning before work to hike in "my backyard." If the trail is full of tourists, we can't go. That doesn't sound like a "better plan" to me.

If this plan to limit the number of hikers is implemented, the limit pertains to visitors as well as local residents. There is the opportunity to be a volunteer and in exchange we can have unlimited access to hiking. That sounds like it is a possibility, a way around the rule. But then again, that can get changed at anytime and revoked or limited for residents as well, especially if there are way more volunteers that sign up in order to be able to hike. I don't trust that "promise."

Will the limit of people be only on the trail or on the beach? If there is a limit, does someone get to hike once someone else gets off the trail? Is there a line waiting to hike once there is a vacancy? Does someone get to enter the trail if someone gets off the trail and goes to enjoy the beach? Or is the limit pertaining to the number of people in the park (only up to Hanakapi'ai or does it count if you back pack into Kalalau?) - on the trail plus on the beach? Would we need to have a "reservation" or wait in line to go walk on the beach, to go swimming or watch the sunset?

**I am strongly in objection to having a gate that can close the park,** such as blocking the beach for moonsets and early morning kayak launches or landings. I think there was some mention made of allowing fishing - is that during the night hours or early morning hours? For kayaking, at any time of day/night, there will need to be vehicle access in order to drop off/pick up the kayak as well.

**Again, nothing matters unless there is a shuttle service to keep bulk of the cars away, however not restricting local vehicles for kayaking, fishing, etc.** There was mention that there would be handicap access

for those who can't walk. Similarly, there should also be access for fishing and kayaking. The shuttle service should be provided by the visitor industry - the hotels, etc that profit from this onslaught of tourists. Not provided by the local community. Details need to be worked out for that. Exactly what hui or hotels, etc will fund the shuttle project? Do the passengers pay to ride? It can't be ONLY for tourists, it has to be available for residents as well - remember, no discrimination as in limiting the number of hikers. Where does everyone park their car to catch the shuttle? Will the shuttle hold backpacking, hiking, beach gear, coolers? Where will it stop along the way for getting on/off or sightseeing for the visitors? Will it hang up local traffic to Hae'na/Wainiha? Will it turn around at the very end of the road? Will it carry bikes?

I don't particularly support the idea of a boardwalk - it is so "mainland" and "un-Kauai." (That's my best reasoning.) And I don't see the purpose of a huge visitor center. That money can be better spent on a shuttle. Bathrooms need to be provided, yes. What is there now seems to be adequate, unless the septic system is not. I don't know about that. In addition to a shuttle, there should be parking for a certain number of cars, for local residents who might not be riding the shuttle, fishing, parking for kayaking, for extended backpacking, etc.

**Above all, Kauai needs to STOP building more hotel/ vacation rental units AND STOP ALLOWING MORE CARS ON THE ISLAND!!!!**

I would like to see another community meeting on this topic where questions are allowed to be asked and discussed. I think the proposal as it stands has to be reassessed and changed. I am heartbroken that the situation at Ke'e has gotten so bad and I don't want to lose access to my precious magical "backyard" as there has been so much lost already. Please do your best to preserve this area for the locals and don't give up yet another Hawaiian jewel to the visitors.

Ms. Susie Ayers  
SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN DRAFT ENVIRONMENTAL  
IMPACT STATEMENT (EIS), HĀ'ENA, KAUA'I, HAWAII  
Month XX, 2018  
Page 2

The Master Plan includes a combination of physical improvements and programmatic options that when applied in combination will have a positive impact on the existing roadway conditions.

Vehicle access beyond the main parking area to Kē'e beach is proposed to be reduced from the currently unrestricted conditions to special access only (ADA, lifeguards, and cultural practitioners). Restricting general vehicular access from the main parking area to Kē'e Beach will effectively eliminate illegal parking along the highway's shoulder, reduce the wear on the historic roadway's macadam surface, and reduce the number of visitors traveling in a potential rockfall hazard area. Please see the "Parking" and "Roadways and Traffic" attachments from the Final EIS, which show the verbatim changes from the Draft EIS for these sections.

We also recognize your comments on emphasizing shuttle service to achieve successful implementation of the revised master plan. The new main parking lot expansion is intended to alleviate the strain on current parking demand along with facilities designed to support the recommended shuttle service proposed. As you noted, the potential shuttle service is not proposed to be administered by State Parks in the revised master plan, however, it does include specific elements to support effective implementation with infrastructure design for the proposed park entry and main parking lot. The recommended shuttle service particulars have not yet been determined. A proposed third-party shuttle service has been analyzed as a part of the project's traffic impact assessment report, included in the EIS as Appendix F. The preferred scenario is to implement a third-party shuttle from the Princeville facility at the start of Phase I, minimizing the need for visitor parking in the parking lot in the park. Please see the "Shuttle Service" attachment from Section 4.3.3 of the Final EIS, which shows the verbatim changes from the Draft EIS for this section.

We also recognize your questions on managing the proposed visitors relating to hikers accessing trails and concern over communicating real time information on potential limits. As noted previously, the proposals include an adaptive management on the proposed visitor limits, which applies to a total number of visitors accessing the park through the park entry proposed near the new main parking lot. We acknowledge your comments expressing opposition to the originally proposed boardwalk and visitor center. The revised master plan includes significant changes and minimal physical improvements to preserve the natural beauty of the park. Most of the proposed buildings, including the visitor center and caretaker's cottage, have been removed in the revised master plan. The boardwalk has been modified in the revised master plan. The new pedestrian pathway follows along the first berm of the lot closest to the highway and is proposed to be slightly elevated so as not to impact the berm or any of the historic resources. Please see the revised Figure 1 Master Plan graphic and the "Master Plan Summary" attachment from Section 1.9.1 of the Final EIS, which show the verbatim changes from the Draft EIS in this section.

We also acknowledge your comments on the necessity of new restrooms. The proposed facilities are designed with the intention of improving and mitigating any impact on the sensitive areas at Kē'e with advanced wastewater treatment systems. In addition, we recognize comments on preserving the areas for local residents and limiting rental cars and hotel developments on the island, however, the comments are beyond the scope of the Final EIS. We also acknowledge your request for additional community meetings. The environmental review process has included opportunities for public comment throughout the process. In addition, State Parks held a public meeting on August 19, 2015 to gather more input and extended the Draft EIS public comment period to allow more time for feedback from the community before revising the master plan.

Month XX, 2018 - DRAFT

Ms. Susie Ayers  
P.O. Box 293  
Hanalei, HI 96714

SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUA'I, HAWAII

Aloha Ms. Ayers,

Mahalo nui for your emailed comment dated September 7, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your comments regarding equal access to the park for residents as well as visitors, and access to the park late at night for events such as moonsets. Entry fees for state parks are established by Hawai'i Administrative Rules (HAR) 13-146-6, which states that Hawai'i residents are exempt from paying park entry fees if they can show a valid Hawai'i ID. Other categories of fee exempt park users, such as registered volunteers, may be established at a later time. The visitor limits are a part of the park's adaptive management approach and will be instituted only during peak hours of park use, allowing visitors to enter before and after peak hours without being counted against the visitor limit. There will also be exemptions from the visitor limit total for special user groups from the community, such as cultural practitioners. Please see the "Visitor Limits" attachment from Section 2.5.4.3 of the Final EIS, which shows the verbatim changes from the Draft EIS for this section.

We also recognize your comments relating to accessing Kē'e Beach for launching and landing kayaks. The revised master plan restricts vehicle access along the corridor between the proposed park entry turnaround and Kē'e Beach due to the rockfall hazard and will only be permitted for special user groups such as lifeguards and those with ADA parking placards.

We acknowledge your concerns with existing traffic congestion, parking, and overcrowding, as well as your comments on the impact of tourism and regulations to address this impact. The revised master plan calls for an adaptive management approach for both the parking and the proposed visitor limits, which will be adjusted based on an average number of visitors rather than a set limit per day. The main parking lot is proposed to be separated into a fee-paying lot and non-fee-paying lot, which will also be adjusted daily to allow flexibility depending on future demand for parking and the potential use of the proposed shuttle.

Please share your comments on the Hä'ena State Park Master Plan Draft EIS.

(If you would like a written response letter, please include your mailing address.)

This plan ultimately depends on having a shuttle - unlike that it is plan the rest of it really is a route point  
I am strongly opposed to any kind of gate that would close the road + restrict vehicle traffic to local residents - for liability, kayak launch + pickup + for enjoying the end of the road beach views during early morning hours + late night hours that would likely be out of standard "park hours", as well as backpack drop off + pick ups.

Hanalei, HI 96714

**SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUAI, HAWAII**

Aloha Ms. Ayers,

Mahalo nui for your comment card dated September 11, 2015 from the community meeting held on August 19, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your comment regarding the inclusion of a shuttle in the master plan. A proposed third party shuttle service has been analyzed as a part of the project's traffic impact assessment report, included in the EIS as Appendix F. The preferred scenario is to implement a third party shuttle from the Princeville facility at the start of Phase I, minimizing the need for visitor parking in the parking lot in the park. Please see the "Shuttle Service" attachment from Section 4.3.3 of the Final EIS, which shows the verbatim changes from the Draft EIS for this section.

We also recognize your comment regarding the inclusion of a gate in the master plan, and possible access restrictions to residents as a result. A new main gate is recommended to be installed to reduce visitor exposure to the rockfall hazards. Only those with special access to Kē'e, such as the lifeguards and rescue personnel, those with valid ADA parking placards or plates, park staff, the Hula Complex and other cultural practitioners will be allowed along the limited access portion of the highway. Please see the "Park Entry" attachment from Section 2.5.1.1 of the Final EIS, which shows the verbatim changes from the Draft EIS for this section.

The revised master plan calls for an adaptive management approach for both the parking and the proposed visitor limits, which will be adjusted based on an average number of visitors rather than a set limit per day. The limits will also be instituted only during peak hours of park use and will allow visitors to enter before and after peak hours without being counted against the visitor limit. Please see the "Visitor Limits" attachment from Section 2.5.4.3 of the Final EIS, which show the verbatim changes from the Draft EIS for this section.

Aloha Ms. Yuen,

My name is Alison Chuang. I was born and raised on Kauai, and have been living in Ha'ena for 22 years. My partner David LaCock has been living in Ha'ena for 40 years. Our five children were born in Ha'ena and are being raised here. Although we agree there are issues that need to be addressed at Ke'e, we all OPPOSE the proposed masterplan. Mostly because we do not believe that protection of a place and its culture will be solved by a set of restriction, regulation, and rules. It dangerously boxes in even those that are trusting in and asking for this plan. Please reconsider. There is great potential for solution thru baby steps instead of one singular great plan that seems overwhelming, confusingly worded, and thru it's language format may even contain unintended trickery. This plan also unmistakably may restrict visitors to Ke'e, but the consequence of that is an overflow to other precious resources in Ha'ena. It could be an opening of a can of worms.

On behalf of myself and my ohana we humbly oppose the Ke'e masterplan.

Mahalo Nui,  
Alison

Month XX, 2018 - DRAFT

Ms. Alison Chuang  
P.O. Box 484  
Hanalei, HI 96714

**SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUA'I, HAWAII**

Aloha Ms. Chuang,

Mahalo nui for your emailed comment dated September 8, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your concerns with regulating access to the park and the potential impact on neighboring communities and beaches. We also acknowledge your suggestions for incremental "baby steps" for implementing the proposed master plan and concern with regulation as a solution. The revised master plan calls for an adaptive management approach as a primary management concept for State Parks to adjust management decisions over time and allow flexibility. We acknowledge your overall concerns with implementing the master plan. The revised master plan is designed to adapt to future conditions and includes management guidelines to reflect this adaptive approach to address community concerns. Please see the attached section on **Adaptive Management** from the Final EIS. Another key management recommendation is to establish a permanent Cultural Advisory Group and Community Advisory Committee, which is described in **Section 2.5.4.2** of the Final EIS and attached for your reference. We recognize your comment concerning unintended consequences that may impact other important resources in Hā'ena. The intention of these key management recommendations is to monitor conditions over time and adapt as the State has more time to analyze user patterns and explore other options over time, and they are actively engaged in discussions regarding parking enforcement and increased fines along the roadway outside of the park as well.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oeqc2.doh.hawaii.gov/EA\\_EIS\\_Library/2018--KA-FEIS-Haena-State-Park-Master-Plan.pdf](http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2018--KA-FEIS-Haena-State-Park-Master-Plan.pdf) on **Month XX, 2018**.

---

Dear Ms. Tanaka,

After reading the proposed master plan for Ha'ena State Park and attending the community meeting on 8-19-15, I feel I must strongly oppose the plan at this time. It seems that before any park plan can be considered a concrete solution to the parking problem, and car traffic leading out to the park needs to be in place. Kuhio Hwy. is already over run with illegally parked cars with little to know enforcement. I am not blaming KPD for this, as their hands are tied since it is not their policy to tow illegally parked cars. It seems to be no problem for tourists to pay parking tickets since the amount is no more than they pay to park at the beach on the mainland. The plan as it is written, only allows for parking for 100 cars and 900 people.

The overflow of people would now be turned loose on the residential and conservation community of Ha'ena. Again, this is a RESIDENTIAL neighborhood! There are no parking lots or public facilities at Makua. We already have people wanting to park in our driveways as well as wander through our yards to find a way to the beach. The justification for this I'm told is . . . a. Where's your Aloha? b. Tourism pays your salaries. c. We paid big money for this. d. But we've been driving for hours in traffic for our day on the north shore. The new Master Plan doesn't address any of this. Yet it will dump all of the cars beyond the 100 limit back on to Kuhio Hwy. where again THERE IS NO PARKING! The only vague allusion to a solution is a mention of a possible, yet not yet realized shuttle. This was just tried and shut down when the public had the choice they wanted their cars not public transportation.

I would truly love to see improvements to Ha'ena State Park. I have lived in the community for almost 30 yrs. and the only successful solution I can see for visitors and the neighborhood, is to restrict cars entering the area to permitted cars only, and create several large parking areas outside the area. They could be in the Princeville and Hanalei business districts with shuttles available throughout the day, with many stops to show off our many beautiful natural and cultural points of interest. Permit parking has proven to work in many areas where there are large number of cars because of tourism. It would even bring in revenue to help run the shuttles since there would be a fee for each vehicle permitted. Businesses such as UPS, Fed Ex, and small businesses like gardeners could purchase a permit that can be moved to different trucks as needed to provide services. Also, guest permits could be made available, as

well as parking on ones own property for guests.

In addition to the issues of parking and number of cars, I am also Horrified that unless you are counted into the 900, locals would be turned away from the park unless they are part of a special group i.e. volunteers, a hula halau, kalo farmers. What if I just want to enjoy my beautiful park one morning, just because I do TPOB 1365, Hanalei, HI 96714hat. There was talk at the meeting about not discriminating against tourists, what about those of us who live here?

Please understand, Ms. Tanaka I love my community and am crying as I write this for fear that it will be ruined by people with all the best intentions, and not enough advance planning. Before it's to late, please don't go through with this plan.

Respectfully,

Audrey Venneman

IMPACT STATEMENT (EIS), HĀ'ENA, KAUA'I, HAWAII  
Month XX, 2018  
Page 2

We recognize your concerns regarding access to the park for local residents. The visitor limits previously mentioned as a part of the park's adaptive management approach will be instituted only during peak hours of park use and will allow visitors to enter before and after peak hours without being counted against the visitor limit. Also, entry fees for state parks are established by Hawai'i Administrative Rules (HAR) 13-146-6, which states that Hawai'i residents are exempt from paying park entry fees if they can show a valid Hawai'i ID. Other categories of fee exempt park users, such as registered volunteers, may be established at a later time.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oeqc2.doh.hawaii.gov/EA\\_EIS\\_Library/2018-\\_-KA-FEIS-Haena-State-Park-Master-Plan.pdf](http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2018-_-KA-FEIS-Haena-State-Park-Master-Plan.pdf) on , 2018.

Fw: Hā'ena State Park - J51.docx

Month XX, 2018 - DRAFT  
Ms. Audrey Venneman  
P.O. Box 1365  
Hanalei, HI 96714  
SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUA'I, HAWAII

Aloha Ms. Venneman,

Mahalo nui for your emailed comment dated September 8, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your concerns regarding parking and traffic issues related to the master plan. The revised master plan calls for an adaptive management approach for both the parking and the proposed visitor limits, which will be adjusted based on an average number of visitors rather than a set limit per day. The main parking lot is proposed to be separated into a fee-paying lot and non-fee-paying lot, which will also be adjusted daily to allow flexibility depending on future demand for parking and the potential use of the proposed shuttle.

The Master Plan includes a combination of physical improvements and programmatic options that when applied in combination will have a positive impact on the existing roadway conditions.

Vehicle access beyond the main parking area to Ke'e beach is proposed to be reduced from the currently unrestricted conditions to special access only (ADA, lifeguards, and cultural practitioners). Restricting general vehicular access from the main parking area to Ke'e Beach will effectively eliminate illegal parking along the highway's shoulder, reduce the wear on the historic roadway's macadam surface, and reduce the number of visitors traveling in a potential rockfall hazard area. Please see the "Parking" and "Roadways and Traffic" attachments from the Final EIS, which show the verbatim changes from the Draft EIS for these sections.

We recognize your concerns regarding shuttle service options. A proposed third party shuttle service has been analyzed as a part of the project's traffic impact assessment report, included in the EIS as Appendix F. The preferred scenario is to implement a third party shuttle from the Princeville facility at the start of Phase I, minimizing the need for visitor parking in the parking lot in the park. Please see the "Shuttle Service" attachment from Section 4.3.3 of the Final EIS, which shows the verbatim changes from the Draft EIS for this section.

Please share your comments on the Hā'ena State Park Master Plan Draft EIS.

(If you would like a written response letter, please include your mailing address.)

1. extend comment period by 30 days
2. require impact fees from hotels  
vacation rentals to offset costs  
of shuttle to Kē'e.
3. require Hawaii Visitors Bureau  
to contribute funds to finance shuttle  
and shuttle infrastructure.
4. Continue community advisory  
committee permanently.

SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUAI, HAWAII

Aloha Ms. Van De Veer,

Mahalo nui for your comment card dated September 8, 2015 from the community meeting held on August 19, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your comment regarding the length of the EIS comment period. The official 45-day public comment period on the DEIS began on July 23, 2015 and ended on September 8, 2015. However, State Parks held a public meeting on August 19, 2015 to gather more input on the DEIS and extended the DEIS public comment period until October 8, 2015. Comments on the DEIS received during this public comment period and the responses to the comments are incorporated in this FEIS and copies of those letters are included in EIS Section 13.0.

We recognize your comment regarding fees from private parties and organizations to fund a proposed shuttle service. A third-party shuttle service is supported by the design of the master plan with a drop off area near the front of the park, however, funding for such a third-party service is not a part of the State's master plan scope.

We recognize your comment regarding the continuation of a community advisory committee. The Hā'ena State Park Community Advisory Committee, or HSPCAC, has been established and will provide ongoing support and consultation on general park issues including the implementation of the master plan. The group has adopted a charter and plans to meet regularly, particularly when State Parks or the future management entity undertake any improvement projects or changes in park policy. This is described in Section 2.5.4.2 of the EIS and the verbatim description of the group is included in the "Cultural and Community Advisory Group" attachment.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oeqc2.doh.hawaii.gov/EA\\_EIS\\_Library/2018\\_KA-FEIS-Haena-State-Park-Master-Plan.pdf](http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2018_KA-FEIS-Haena-State-Park-Master-Plan.pdf) on \_\_\_\_\_, 2018.

Aloha,  
Attached is a petition from 'ohana of Halele'a who strongly oppose the current plans for Ke'e as introduced to us recently at the meeting in Hanalei. We are unified in our decision to oppose the development of sacred Ke'e. These signatures were gathered over the last 3 days. Please let me know how we can follow the plans from this stage as we are committed to protecting Ke'e.

Mahalo,  
Hoku Cabebe

September 4, 2015  
Aloha,

This petition is to the different entities involved in the new state plans for Ke'e and Ha'ena. We the makua of the generational descendants of Halele'a and our supporters are against the new plans by the state and all currently involved with these plans for the wahi pana and wahi kapu of Ke'e. We do not think that the current plans will accomplish the goals that we seek which is to restore our subsistence area and to instill the traditions left to us by our kupuna in our keiki. The current plans that have been put forth encourages a robust tourist destination in a conservation area with more development and no resolve to the car congestion from Princeville to Ke'e and appears to be a land and money grab by those who have benefited from grants and non profits for many, many years while the lineal descendants experience declines in health and cannot access our sustainable fishing and farming areas. We feel the plans further distance the kanaka maoli of this area from their rightful kuleana. We support a new plan that looks at the overall picture of the problems that Ke'e face as well as rightful and pono land ownership and stewardship by the original 'ohana of the area, not a open public bidding process. There are many other issues that need to be addressed in the plans so we ask that you please stop this process and let us evaluate, reorganize and restructure so pono can be restored to our beloved Ha'ena. The two weeks you have given us since the announcement of these plans is not enough.

We do not think that the current plans will accomplish the goals that we seek which is to restore our subsistence area and to instill the traditions left to us by our kupuna in our keiki'. The current plans that have been put forth encourages a robust tourist destination in a conservation area with more development and no resolve to the car congestion from Princeville to Ke'e and appears to be a land and money grab by those who have benefited from grants and non profits for many, many years while the lineal descendants experience declines in health and cannot access our sustainable fishing and farming areas. We feel the plans further distance the kanaka maoli of this area from their rightful kuleana. We support a new plan that looks at the overall picture of the problems that Ke'e face as well as rightful and pono land ownership and stewardship by the original 'ohana of the area, not a open public bidding process. There are many other issues that need to be addressed in the plans so we ask that you please stop this process and let us evaluate, reorganize and restructure so pono can be restored to our beloved Ha'e'ena. The two weeks you have given us since the announcement of these plans is not enough.

Mahalo me ke aloha.

Aloha,

This petition is to the different entities involved in the new state plans for Ke'e and Ha'ena. We the makua of the generational descendants of Halele'a and our supporters are against the new plans by the state and all currently involved with these plans for the wahi pana and wahi kapu of Ke'e. We do not think that the current plans will accomplish the goals that we seek which is to restore our subsistence area and to instill the traditions left to us by our kupuna in our keiki. The current plans that have been put forth encourages a robust tourist destination in a conservation area with more development and no resolve to the car congestion from Princeville to Ke'e and appears to be a land and money grab by those who have benefited from grants and non profits for many, many years while the lineal descendants experience declines in health and cannot access our sustainable fishing and farming areas. SUBJECT: COMMENTS ON THE HÄ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HÄ'ENA, KAUA'I, HAWAII

Aloha Ms. Cabebe,

Mahalo nui for your email dated September 8, 2015 with the petition signed by the 'ohana of Halele'a regarding the Hä'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. As a member of the reorganized Hä'ena State Park Community Advisory Committee (HSPCAC), you know the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with the HSPCAC to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We appreciate you and the other signatories of the petition for voicing your objection to the previous version of the master plan. We needed to hear the voices of the next generation of Halele'a 'ohana and we thank you for your input. The plan has been greatly simplified with less development including the elimination of the Education and Cultural Center and Caretaker's Cottage. It also encourages the development of a North Shore shuttle to reduce car congestion. Please see the revised Master Plan Summary from Section 1.9.1 and Figure 1 showing the updated master plan graphic from the Final EIS. The full master plan report is available for download at the State Parks Hä'ena State Park website: <http://dlmr.hawaii.gov/dsp/parks/kaui/haena-state-park/>.

As previously proposed, the visitor limits would not include cultural practitioners, lo'i workers, and hunters. State Parks wants to encourage local residents to return to the park and so your continued input is welcomed should access become an issue.

The plan has been revised based on the input received and the public comment period for the Draft EIS was extended for additional month to allow more time for public comment.

Mahalo nui for your dedication to Hä'ena State Park and your participation in the reorganized HSPCAC. Please share this response with those who signed the petition but did not leave an address. Your email and the petition will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at: [http://oeq2.deh.hawaii.gov/EA\\_EIS\\_Library/2018--KA-EIS-Haena-State-Park-Master-Plan.pdf](http://oeq2.deh.hawaii.gov/EA_EIS_Library/2018--KA-EIS-Haena-State-Park-Master-Plan.pdf) on , 2018.

SUBJECT: COMMENTS ON THE HÄ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HÄ'ENA, KAUA'I, HAWAII

Aloha Mr. Blair,

Mahalo for the September 4, 2015 petition, which you signed along with members of the 'ohana of Halele'a regarding the Hä'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. The Department of Land and Natural Resources, Division of State Parks (State Parks) has been working with a reorganized Hä'ena State Park Community Advisory Committee (HSPCAC) to revise the master plan based on the concerns voiced by the larger community. Ms. Hoku Cabebe and Ms. Koral McCarthy, who also signed the petition, have been participating as members of the HSPCAC and the master plan presented in the Final EIS has been updated based on the feedback. As the planning consultant for State Parks, we offer the following responses to your comments.

We appreciate you and the other signatories of the petition for voicing your objection to the approved version of the master plan. We needed to hear the voices of the next generation of Halele'a 'ohana and we thank you for your input. The plan has been greatly simplified with less development including the elimination of the Education and Cultural Center and Caretaker's Cottage. It also encourages the development of a North Shore shuttle to reduce car congestion. Please see the revised Master Plan Summary from Section 1.9.1 and Figure 1 showing the updated master plan graphic from the Final EIS. The full master plan report is available for download at the State Parks Hä'ena State Park website: <http://dlmr.hawaii.gov/dsp/parks/kaui/haena-state-park/>.

As previously proposed, the visitor limits would not include cultural practitioners, lo'i workers, and hunters. State Parks wants to encourage local residents to return to the park and so your continued input is welcomed should access become an issue.

The plan has been revised based on the input received and the public comment period for the Draft EIS was extended for additional month to allow more time for public comment.

Mahalo nui for your input and dedication to Hä'ena State Park. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oeq2.doh.hawaii.gov/EA\\_EIS\\_Library/2018--KA-FEIS-Haena-State-Park-Master-Plan.pdf](http://oeq2.doh.hawaii.gov/EA_EIS_Library/2018--KA-FEIS-Haena-State-Park-Master-Plan.pdf) on Month XX, 2018.

SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUA'I, HAWAII

Aloha Mr. Frank,

Mahalo for the September 4, 2015 petition, which you signed along with members of the 'ohana of Halele'a regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. The Department of Land and Natural Resources, Division of State Parks (State Parks) has been working with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to revise the master plan based on the concerns voiced by the larger community. Ms. Hoku Cabebe and Ms. Koral McCarthy, who also signed the petition, have been participating as members of the HSPCAC and the master plan presented in the Final EIS has been updated based on the feedback. As the planning consultant for State Parks, we offer the following responses to your comments.

We appreciate you and the other signatories of the petition for voicing your objection to the approved version of the master plan. We needed to hear the voices of the next generation of Halele'a 'ohana and we thank you for your input. The plan has been greatly simplified with less development including the elimination of the Education and Cultural Center and Caretaker's Cottage. It also encourages the development of a North Shore shuttle to reduce car congestion. Please see the revised Master Plan Summary from Section 1.9.1 and Figure 1 showing the updated master plan graphic from the Final EIS. The full master plan report is available for download at the State Parks Hā'ena State Park website: <http://dlmr.hawaii.gov/dsp/parks/kaui/haena-state-park/>.

As previously proposed, the visitor limits would not include cultural practitioners, lo'i workers, and hunters. State Parks wants to encourage local residents to return to the park and so your continued input is welcomed should access become an issue.

The plan has been revised based on the input received and the public comment period for the Draft EIS was extended for additional month to allow more time for public comment.

Mahalo nui for your input and dedication to Hā'ena State Park. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at

SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUA'I, HAWAII

Aloha Ms. Frank,

Mahalo for the September 4, 2015 petition, which you signed along with members of the 'ohana of Halele'a regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. The Department of Land and Natural Resources, Division of State Parks (State Parks) has been working with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to revise the master plan based on the concerns voiced by the larger community. Ms. Hoku Cabebe and Ms. Koral McCarthy, who also signed the petition, have been participating as members of the HSPCAC and the master plan presented in the Final EIS has been updated based on the feedback. As the planning consultant for State Parks, we offer the following responses to your comments.

We appreciate you and the other signatories of the petition for voicing your objection to the previous version of the master plan. We needed to hear the voices of the next generation of Halele'a 'ohana and we thank you for your input. The plan has been greatly simplified with less development including the elimination of the Education and Cultural Center and Caretaker's Cottage. It also encourages the development of a North Shore shuttle to reduce car congestion. Please see the revised Master Plan Summary from Section 1.9.1 and Figure 1 showing the updated master plan graphic from the Final EIS. The full master plan report is available for download at the State Parks Hā'ena State Park website: <http://dlmr.hawaii.gov/dsp/parks/kaui/haena-state-park/>.

As previously proposed, the visitor limits would not include cultural practitioners, lo'i workers, and hunters. State Parks wants to encourage local residents to return to the park and so your continued input is welcomed should access become an issue.

The plan has been revised based on the input received and the public comment period for the Draft EIS was extended for additional month to allow more time for public comment.

Nancy - KY.docx

SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUA'I, HAWAII

Aloha Ms. Martin,

Mahalo for the September 4, 2015 petition, which you signed along with members of the 'ohana of Halele'a regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. The Department of Land and Natural Resources, Division of State Parks (State Parks) has been working with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to revise the master plan based on the concerns voiced by the larger community. Ms. Hoku Cabebe and Ms. Koral McCarthy, who also signed the petition, have been participating as members of the HSPCAC and the master plan presented in the Final EIS has been updated based on the feedback. As the planning consultant for State Parks, we offer the following responses to your comments.

We appreciate you and the other signatories of the petition for voicing your objection to the previous version of the master plan. We needed to hear the voices of the next generation of Halele'a 'ohana and we thank you for your input. The plan has been greatly simplified with less development including the elimination of the Education and Cultural Center and Caretaker's Cottage. It also encourages the development of a North Shore shuttle to reduce car congestion. Please see the revised Master Plan Summary from Section 1.9.1 and Figure 1 showing the updated master plan graphic from the Final EIS. The full master plan report is available for download at the State Parks Hā'ena State Park website: <http://dlnr.hawaii.gov/dsp/parks/kaui/haena-state-park/>.

As previously proposed, the visitor limits would not include cultural practitioners, lo'i workers, and hunters. State Parks wants to encourage local residents to return to the park and so your continued input is welcomed should access become an issue.

The plan has been revised based on the input received and the public comment period for the Draft EIS was extended for additional month to allow more time for public comment.

Mahalo nui for your input and dedication to Hā'ena State Park. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at <http://oeq2.doh.hawaii.gov/EA-EIS/Library/2018--KA-FEIS-Haena-State-Park-Master-Plan.pdf> on Month XX, 2018.

**SUBJECT:** COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUAI, HAWAII

Aloha Mr. Puulei-Chandler,

Mahalo for the September 4, 2015 petition, which you signed along with members of the 'ohana of Halealea regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. The Department of Land and Natural Resources, Division of State Parks has been working with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to revise the master plan based on the concerns voiced by the larger community. Ms. Hoku Cabebe and Ms. Koral McCarthy, who also signed the petition, have been participating as members of the HSPCAC and the master plan presented in the Final EIS has been updated based on the feedback. As the planning consultant for State Parks, we offer the following responses to your comments.

We appreciate you and the other signatories of the petition for voicing your objection to the previous version of the master plan. We needed to hear the voices of the next generation of Halealeʻa -olana and we thank you for your input. The plan has been greatly simplified with less development including the elimination of the Education and Cultural Center and Caretaker's Cottage. It also encourages the development of a North Shore shuttle to reduce car congestion. Please see the revised Master Plan Summary from Section 1.9.1 and Figure 1 showing the updated master plan graphic from the Final EIS. The full master plan report is available for download at the State Parks Haleʻana State Park website: <http://dlmr.hawaii.gov/dslp/parks/kauai/haena-state-park/>.

As previously proposed, the visitor limits would not include cultural practitioners, local workers, and hunters. State Parks wants to encourage local residents to return to the park and so your continued input is welcomed should access become an issue.

The plan has been revised based on the input received and the public comment period for the Draft EIS was extended for additional month to allow more time for public comment.

Mahalo nui for your input and dedication to Hā'ena State Park. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. SUBJECT: COMMENTS ON THE HÄ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HÄ'ENA, KAUA'I, HAWAII

Aloha Ms. Taylor,

Mahalo for the September 4, 2015 petition, which you signed along with members of the 'ohana of Halele'a regarding the Hä'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. The Department of Land and Natural Resources, Division of State Parks (State Parks) has been working with a reorganized Hä'ena State Park Community Advisory Committee (HSPCAC) to revise the master plan based on the concerns voiced by the larger community. Ms. Hoku Cabebe and Ms. Koral McCarthy, who also signed the petition, have been participating as members of the HSPCAC and the master plan presented in the Final EIS has been updated based on the feedback. As the planning consultant for State Parks, we offer the following responses to your comments.

We appreciate you and the other signatories of the petition for voicing your objection to the previous version of the master plan. We needed to hear the voices of the next generation of Halele'a 'ohana and we thank you for your input. The plan has been greatly simplified with less development including the elimination of the Education and Cultural Center and Caretaker's Cottage. It also encourages the development of a North Shore shuttle to reduce car congestion. Please see the revised Master Plan Summary from Section 1.9.1 and Figure 1 showing the updated master plan graphic from the Final EIS. The full master plan report is available for download at the State Parks Hä'ena State Park website: <http://dlmr.hawaii.gov/dsp/parks/kaui/haena-state-park/>.

As previously proposed, the visitor limits would not include cultural practitioners, lo'i workers, and hunters. State Parks wants to encourage local residents to return to the park and so your continued input is welcomed should access become an issue.

The plan has been revised based on the input received and the public comment period for the Draft EIS was extended for additional month to allow more time for public comment.

Mahalo nui for your input and dedication to Hä'ena State Park. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at <http://oeq2.doh.hawaii.gov/EA-EIS/Library/2018--KA-FEIS-Haena-State-Park-Master-Plan.pdf> on Month XX, 2018.

Brandon - KY.docx

SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUA'I, HAWAII

Aloha Mr. Ziegler,

Mahalo for the September 4, 2015 petition, which you signed along with members of the 'ohana of Halele'a regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. The Department of Land and Natural Resources, Division of State Parks (State Parks) has been working with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to revise the master plan based on the concerns voiced by the larger community. Ms. Hoku Cabebe and Ms. Koral McCarthy, who also signed the petition, have been participating as members of the HSPCAC and the master plan presented in the Final EIS has been updated based on the feedback. As the planning consultant for State Parks, we offer the following responses to your comments.

We appreciate you and the other signatories of the petition for voicing your objection to the previous version of the master plan. We needed to hear the voices of the next generation of Halele'a 'ohana and we thank you for your input. The plan has been greatly simplified with less development including the elimination of the Education and Cultural Center and Caretaker's Cottage. It also encourages the development of a North Shore shuttle to reduce car congestion. Please see the revised Master Plan Summary from Section 1.9.1 and Figure 1 showing the updated master plan graphic from the Final EIS. The full master plan report is available for download at the State Parks Hā'ena State Park website: <http://dlmr.hawaii.gov/dsp/parks/kaui/haena-state-park/>.

As previously proposed, the visitor limits would not include cultural practitioners, lo'i workers, and hunters. State Parks wants to encourage local residents to return to the park and so your continued input is welcomed should access become an issue.

The plan has been revised based on the input received and the public comment period for the Draft EIS was extended for additional month to allow more time for public comment.

Mahalo nui for your input and dedication to Hā'ena State Park. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at <http://oeq2.doh.hawaii.gov/EA-EIS/Library/2018--KA-FEIS-Haena-State-Park-Master-Plan.pdf> on Month XX, 2018.

**Subject:** Follow up letter for State Plans for Ha'ena  
**Attachments:** October 8 Haena.docx

October 8, 2015

Aloha,

This is a follow up letter in regards to the petition sent by na makua of the generational descendents of Halele'a and our supporters in regards to the Ha'ena state plans. We mahalo you for extending the comment period for 30 days. It did allow us a little more time to go thru the document but of course we did not have enough time and resources needed to fully examine the document or have an opportunity to speak to all those who have assisted with the plans in the short time allowed for community review and input. The little research and the conversations with a few of the advisory members conducted in the extended time heightens our original concerns that this plan does not address the real problems that Ha'ena and the kanaka maoli of Ha'ena face and only looks to commodify the special and sacred resources our ahupua'a holds. In the tradition of our kupuna we would like to refocus the plan to a solid plan that restores the original 'ohana of this area to their rightful kuleana as caretakers and decision makers for the ahupua'a of Ha'ena with no opportunity for outside entities to come in and commodify our sacred and special resources as well as turn sacred and culturally sensitive areas into a developed State Park or private playground for the elite. The main problem is overcrowding and over use of a sacred place primarily by visitors with little to no connection to the area. Turning Ke'e into a developed State Park does not lower the impact to our sacred place. Building a second restroom does not lower the impact. Building a visitor center does not lower the impact and capping visitors and closing access seriously violates our rights and kuleana to our sacred places.

We still feel these plans should be halted and any state plans for Ha'ena and Ke'e should encompass a plan that includes all of Halele'a as what happens in one ahupua'a is surely to affect the other ahupua'a in a moku. However we feel immediate remedies that may be easier to implement would be making the 'ohana of Ha'ena and the Hui Maka'ainana o Ha'ena the sole care takers of the area which they have already been doing, more signage and additional no parking areas to reduce traffic and overuse with enforcement by the 'ohana and Hui of Ha'ena. Preferably a boot system that locks cars in violation.

Violators would pay a fee to have boot removed. Income would be kept by the 'ohana and Hui to assist with upkeep and enforcement. Education to the visitors bureau and all affected by the limited access due to preservation and conservation, restoration of the parking area, the addition of a poi mill and a hale halawai for 'ohana gatherings and cultural classes and additional research into the original and rightful land ownership and kuleana of Ha'ena.

Mahalo for taking time to hear our requests. We look forward to working together to restore pono to our beloved Ha'ena.

Me ka ha'aha'a,

P O Box 243  
Hanalei, HI 96714  
  
SUBJECT: COMMENTS ON THE HÄ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HÄ'ENA, KAUA'I, HAWAII

Aloha Ms. Cabebe,

Mahalo nui for your follow up letter dated October 8, 2015 regarding the Hä'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We understand that in the last 30 days you were able to speak with some of the original advisory committee members and that you continued to feel concern for what was proposed in the Draft EIS. As mentioned in our other response to the petition, we greatly appreciate your participation in the reorganized Hä'ena State Park Community Advisory Committee (HSPCAC), which continued to meet to revise the master plan after the close of the extended Draft EIS comment period. We also recognize your concern of having outsiders manage and potentially commodify the park. State Parks has expanded the curatorship agreements with Hui Maka'āinana o Makana (the "Hui") to care for more areas of the park including more of the lo'i system and the Allerton caretaker's Cottage, and the County of Kaua'i has similarly entered into an agreement with the Hui to manage the Ka Ulu A Paoa Heiau.

We recognize your concern regarding more development at the park. As shown on the revised Figure 1 master plan graphic and described in the Master Plan Summary from the EIS attached to our previous response letter, the Education and Cultural Center has been eliminated but the plan maintains a second pair of restrooms for men and women near the main parking lot to reduce the use and impact of the Kā'e comfort station. The proposed visitor limit has now been softened to apply only as a daily average during the peak hours of park use. Cultural practitioners and those with kuleana at the park were not included in the visitor limit. Parking has also been reduced to the 100 parking stalls and will be adaptively managed. Mahalo nui for your recommendations on parking enforcement and opportunities to collect fees to support park upkeep, education to the visitors bureau and all affected by the limited access due to preservation and conservation. Restoration of the parking lot had been completed by the Hui until the recent rains washed it out again. However, State Parks is working on emergency repairs to it. Mahalo nui for your additional recommendations for a poi mill and hale halawai. The Cultural Gathering Area proposed in the master plan provides an area for 'ohana and educational gatherings and where cultural activities and research can take place.

Mahalo nui for your additional input and continued participation in the HSPCAC. Please share this response with those who signed the petition but did not leave an address. Your letter will be included in the Final EIS. As noted, if you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oese2.doh.hawaii.gov/EA\\_HIS\\_Library/2018--KA-EIS-Haena-State-Park-Master-Plan.pdf](http://oese2.doh.hawaii.gov/EA_HIS_Library/2018--KA-EIS-Haena-State-Park-Master-Plan.pdf) on Month XX, 2018

Jade - KY.docx

SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUA'I, HAWAII

Aloha Ms. Candelaria,

Mahalo nui for your follow up letter dated October 8, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We understand that in the 30 days since your last correspondence you were able to speak with some of the original advisory committee members and that you continued to feel concern for what was proposed in the Draft EIS. The reorganized Hā'ena State Park Community Advisory Committee (HSPCAC), which included Hoku Cabebe and Koral McCarthy, met several times to work on revising the master plan after the close of the extended Draft EIS comment period. This revised plan is the subject of the Final EIS.

We also recognize your concern of having outsiders manage the park and potential for them to commodify the park. State Parks has expanded the curatorship agreements with Hui Maka'āinana o Makana (the "Hui") to care for more areas of the park including more of the lo'i system and the Allerton Caretaker's Cottage, and the County of Kaua'i has similarly entered into an agreement with the Hui to manage the Ka Ulu A Paoa Heiau.

We recognize your concern regarding more development at the park. As shown on the revised Figure 1 master plan graphic and described in the Master Plan Summary from the EIS attached to our previous response letter, the Education and Cultural Center has been eliminated but the plan maintains a second pair of restrooms for men and women near the main parking lot to reduce the use and impact of the Ke'e comfort station. The proposed visitor limit has now been softened to apply only as a daily average during the peak hours of park use. Cultural practitioners and those with kuleana at the park such as members of the Hui and cemetery caretakers were not included in the visitor limit. The main visitor parking lot has been reduced to 100 parking stalls and will be adaptively managed. Mahalo nui for your recommendations on parking enforcement and opportunities to collect fees to support park upkeep, education to the visitors bureau and all affected by the limited access due to preservation and conservation. Restoration of the parking lot had been completed by the Hui until the recent rains washed it out again. However, State Parks is working on emergency repairs to it. Mahalo nui for your additional recommendations for a poi mill and hale halawai. The Cultural Gathering Area proposed in the master plan provides an area for 'ohana and educational gatherings and where cultural activities and research can take place.

Mahalo nui for your additional input. Your letter will be included in the Final EIS. As noted, if you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at:  
[http://oeqc2.doh.hawaii.gov/EA\\_EIS\\_Library/2018\\_KA-FEIS-Haena-State-Park-Master-Plan.pdf](http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2018_KA-FEIS-Haena-State-Park-Master-Plan.pdf) on Month XX, 2018

Month XX, 2018 - DRAFT

O:\Job262627\01 DLNR-Haena State Park Master Plan\EIS\DEIS Responses\Mail Merge\zPETITION - Kaamoana, Chantz - KY.docx

Month XX, 2018 - DRAFT

Ms. Jasmine Kleimein  
P.O. Box 1421  
Hanalei, HI 96714

**SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS), HĀ'ENA, KAUA'I, HAWAII**

Aloha Ms. Kleimein,

Mahalo nui for your follow up letter dated October 8, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We understand that in the 30 days since your last correspondence you were able to speak with some of the original advisory committee members and that you continued to feel concern for what was proposed in the Draft EIS. The reorganized Hā'ena State Park Community Advisory Committee (HSPCAC), which included Hoku Cabebe and Koral McCarthy, met several times to work on revising the master plan after the close of the extended Draft EIS comment period. This revised plan is the subject of the Final EIS.

We also recognize your concern of having outsiders manage the park and potential for them to commodify the park. State Parks has expanded the curatorship agreements with Hui Maka'āinana o Makana (the "Hui") to care for more areas of the park including more of the lo'i system and the Allerton Caretaker's Cottage, and the County of Kaua'i has similarly entered into an agreement with the Hui to manage the Ka Ulu A Paoa Heiau.

We recognize your concern regarding more development at the park. As shown on the revised Figure 1 master plan graphic and described in the Master Plan Summary from the EIS attached to our previous response letter, the Education and Cultural Center has been eliminated but the plan maintains a second pair of restrooms for men and women near the main parking lot to reduce the use and impact of the Ke'e comfort station. The proposed visitor limit has now been softened to apply only as a daily average during the peak hours of park use. Cultural practitioners and those with kuleana at the park such as members of the Hui and cemetery caretakers were not included in the visitor limit. The main visitor parking lot has been reduced to 100 parking stalls and will be adaptively managed. Mahalo nui for your recommendations on parking enforcement and opportunities to collect fees to support park upkeep, education to the visitors bureau and all affected by the limited access due to preservation and conservation. Restoration of the parking lot had been completed by the Hui until the recent rains washed it out again. However, State Parks is working on emergency repairs to it. Mahalo nui for your additional recommendations for a poi mill and hale halawai. The Cultural Gathering Area proposed in the master plan provides an area for 'ohana and educational gatherings and where cultural activities and research can take place.

Mahalo nui for your additional input. Your letter will be included in the Final EIS. As noted, if you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oeqc2.doh.hawaii.gov/EA\\_EIS\\_Library/2018\\_KA-FEIS-Haena-State-Park-Master-Plan.pdf](http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2018_KA-FEIS-Haena-State-Park-Master-Plan.pdf) on Month XX, 2018.

O:\Job26\2627\01 D\NR-Haena State Park Master Plan\EIS\Responses\Mail Merge\zPETITION - Puulei-Chandler, Mr\_ Aloysius - KY.docx

Month XX, 2018 - DRAFT

Kalalau Puulei-Chandler  
P.O. Box 243  
Hanalei, HI 96714

**SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUA'I, HAWAII**

Aloha Kalalau Puulei-Chandler,

Mahalo nui for your follow up letter dated October 8, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We understand that in the 30 days since your last correspondence you were able to speak with some of the original advisory committee members and that you continued to feel concern for what was proposed in the Draft EIS. The reorganized Hā'ena State Park Community Advisory Committee (HSPCAC), which included Hoku Cabebe and Koral McCarthy, met several times to work on revising the master plan after the close of the extended Draft EIS comment period. This revised plan is the subject of the Final EIS.

We also recognize your concern of having outsiders manage the park and potential for them to commodify the park. State Parks has expanded the curatorship agreements with Hui Maka'āinana o Makana (the "Hui") to care for more areas of the park including more of the lo'i system and the Allerton Caretaker's Cottage, and the County of Kaua'i has similarly entered into an agreement with the Hui to manage the Ka Ulu A Paoa Heiau.

We recognize your concern regarding more development at the park. As shown on the revised Figure 1 master plan graphic and described in the Master Plan Summary from the EIS attached to our previous response letter, the Education and Cultural Center has been eliminated but the plan maintains a second pair of restrooms for men and women near the main parking lot to reduce the use and impact of the Ke'e comfort station. The proposed visitor limit has now been softened to apply only as a daily average during the peak hours of park use. Cultural practitioners and those with kuleana at the park such as members of the Hui and cemetery caretakers were not included in the visitor limit. The main visitor parking lot has been reduced to 100 parking stalls and will be adaptively managed. Mahalo nui for your recommendations on parking enforcement and opportunities to collect fees to support park upkeep, education to the visitors bureau and all affected by the limited access due to preservation and conservation. Restoration of the parking lot had been completed by the Hui until the recent rains washed it out again. However, State Parks is working on emergency repairs to it. Mahalo nui for your additional recommendations for a poi mill and hale halawai. The Cultural Gathering Area proposed in the master plan provides an area for 'ohana and educational gatherings and where cultural activities and research can take place.

Mahalo nui for your additional input. Your letter will be included in the Final EIS. As noted, if you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oeqc2.doh.hawaii.gov/EA\\_EIS\\_Library/2018\\_KA-FEIS-Haena-State-Park-Master-Plan.pdf](http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2018_KA-FEIS-Haena-State-Park-Master-Plan.pdf) on Month XX, 2018.

Mahalo nui for your follow up letter dated October 8, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We understand that in the 30 days since your last correspondence you were able to speak with some of the original advisory committee members and that you continued to feel concern for what was proposed in the Draft EIS. The reorganized Hā'ena State Park Community Advisory Committee (HSPCAC), which included Hoku Cabebe and Koral McCarthy, met several times to work on revising the master plan after the close of the extended Draft EIS comment period. This revised plan is the subject of the Final EIS.

We also recognize your concern of having outsiders manage the park and potential for them to commodify the park. State Parks has expanded the curatorship agreements with Hui Maka'āinana o Makana (the "Hui") to care for more areas of the park including more of the lo'i system and the Allerton Caretaker's Cottage, and the County of Kaua'i has similarly entered into an agreement with the Hui to manage the Ka Ulu A Paoa Heiau.

We recognize your concern regarding more development at the park. As shown on the revised Figure 1 master plan graphic and described in the Master Plan Summary from the EIS attached to our previous response letter, the Education and Cultural Center has been eliminated but the plan maintains a second pair of restrooms for men and women near the main parking lot to reduce the use and impact of the Ke'e comfort station. The proposed visitor limit has now been softened to apply only as a daily average during the peak hours of park use. Cultural practitioners and those with kuleana at the park such as members of the Hui and cemetery caretakers were not included in the visitor limit. The main visitor parking lot has been reduced to 100 parking stalls and will be adaptively managed. Mahalo nui for your recommendations on parking enforcement and opportunities to collect fees to support park upkeep, education to the visitors bureau and all affected by the limited access due to preservation and conservation. Restoration of the parking lot had been completed by the Hui until the recent rains washed it out again. However, State Parks is working on emergency repairs to it. Mahalo nui for your additional recommendations for a poi mill and hale halawai. The Cultural Gathering Area proposed in the master plan provides an area for 'ohana and educational gatherings and where cultural activities and research can take place.

Mahalo nui for your additional input. Your letter will be included in the Final EIS. As noted, if you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at:  
[http://oeqc2.doh.hawaii.gov/EA\\_EIS\\_Library/2018\\_KA-FEIS-Haena-State-Park-Master-Plan.pdf](http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2018_KA-FEIS-Haena-State-Park-Master-Plan.pdf) on Month XX, 2018

Subject: Haena draft plan public input

To: [Lauren.a.tanaka@hawaii.gov](mailto:Lauren.a.tanaka@hawaii.gov), [K.yuen@pbr.hawaii.com](mailto:K.yuen@pbr.hawaii.com)

To whom it may concern,

I am a twenty year resident of Hawaii and a professional guide and travel writer. I am fortunate to have visited many state managed conservation sites across the islands, and I feel particularly drawn to comment regarding the Haena general plan as shared at the Hanalei School meeting on August 19th, 2015. Im sure you are aware that the first mistake made at this meeting was not having a speaker system to amplify the voice of your soft spoken representatives. This immediately caused unnecessary tension in the crowd and diluted your message. The second and very costly mistake was to not allow public input on the spot. Many locals are now distrusting your intentions for real public input. During your presentation you made numerous references to note cards that can be taken and mailed in for comment. I personally watched your representative at the front door deny peoples request for these cards, forcing them to stay to the end of the meeting to line up and get one. This was disingenuous to your message, and I saw many older residents denied these note cards because they had to leave early.

I was on Kauai for several weeks after the meeting, and witnessed the major impacts of the unregulated Haena tourist traffic on the local community. I spoke as well with many longtime residents who gave me their honest opinion that what they fear is your regulating an area they already cannot access easily due to the maked out roadway and parking areas. As thoughtful as many parts of the master plan are, it is undeniable that the local community already feels slighted by the process.

That being said, most prefer no action over the actions proposed. The plan would definitely address a huge number of issues. However, I would like to point out that small changes would create a better affect in regaining public trust and securing local access. I am wondering if the State can think in small steps. I have personally observed the peak season mayhem of mid-August at Haena. The main issue is lack of education for our visitors, and the continued loss of space for locals to access these areas during peak hours. Cars are parked in every direction they can get away with, because there is now clear outlining of the parking spaces and at worse case scenarios I witnessed cars parked along the roadway all the way back to the popular surf area called "Cannons" which is just after the Haena county park.

Tourist issue simple solution would be to better outline parking areas. Install signage to slow down traffic as early as the dry cave. Secondly create better orientation, either through a visitors center or even a small radio broadcast in the end of road area, signage tells visitors to tune in to the station. It tells the history of the area and how to go about safe parking using existing lots and roadside parking.

Local issue simple solution. Open up a local resident lot, separate from tourists. The areas that locals used to drive thru to park, behind new bathrooms was blocked off many years ago. It was fishermen access traditionally, and letting them back in would be a great step in building trust.

It is hard to ignore that the bathrooms are too close to the ocean to be acceptable. Tourists from all over the planet bring their pathogens and that should be pumped and removed from the area regularly. It is also hard to ignore the rock fall danger on the current park road. Now that it was pointed out at the meeting, it seems that continuing to allow such huge numbers of people to traverse the rock fall impact zone is just begging for a catastrophe. Remember "Sacred Falls" circa 1998. It can happen again at anytime along that road. The inland pedestrian walkway would be a priority in this case, and in doing so you will have to better define the parking area near the "helicopter landing zone". Perhaps a system of stalls reserved for residents could be built into this lot. State ID required, or perhaps stickers issued to residents with proper ID.

Finally, it is grand to encourage the community to volunteer and help with the care taking of Haena. However, during the meeting it was presented in an odd fashion. There was talk about locals "earning" access through volunteering. This seems ludicrous to many a longtime local I spoke with. To have to volunteer to insure access to public lands supported by our taxes has many angered, and really does not honor the fact that the locals are being pushed out by tourists and tourism being drawn to the park. It seems that any plans implemented from this time forward should reduce tourist access while increasing local access.

It is not a bad idea to limit the tourist numbers per day. Many vehicles could be replaced easily with a shuttle from offsite. Perhaps you could work with a local non-profit like "Waipa" to provide a hikers parking for those taking the trail, getting the few hundred cars that are carrying hikers off the end of the road parking would certainly solve some immediate over crowding issues. Plus it would get hikers closer to the trailhead ideally, instead of walking an extra mile from where they parked down the road.

There are many things to consider, your task is great. Good luck. As a reference here are a few places I visited over the last two years that run good crowd control and information programs.

Iolani Palace, Oahu  
Waimea Valley, Oahu  
Hanauma Bay, Oahu  
Honaunau, City of Refuge, Hawaii Island  
Haleakala Park, Maui

All of these sites have dealt with similar issues as you face with Haena. yo might visit or consult with them as you move forward.

Mahalo nui loa for your time in hearing my testimony.

Mr. Jaybird Franey  
SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN DRAFT ENVIRONMENTAL  
IMPACT STATEMENT (EIS), HĀ'ENA, KAUA'I, HAWAII  
Month XX, 2018  
Page 2

We recognize your comment stating most prefer no action over the actions proposed. The "no change" (or No Action) alternative was rejected outright due to factors that include the potential for continued degradation of cultural and natural resources, the worsening traffic and parking congestion that would occur if nothing were done, and the potential risk of rockfalls and threats to public safety.

We recognize and appreciate your suggestion for the education of visitors to the park, this has been incorporated as a part of the master plan in Section 2.5.4. Providing educational information to visitors at the park entry, and providing educational signage at the park will help to minimize impacts to the park's varied natural, cultural, historic, and scenic resources as visitors will learn about appropriate behavior, protocol, and activities permitted in the park, having the beneficial secondary effect of better protection of those resources and reduced user conflicts which will in turn improve mutual understanding, respect, and the feeling of aloha shared by all who visit the park. Please see the "Visitor Orientation" attachment from Section 2.5.4.5 of the Final EIS, which shows the verbatim changes to this section from the Draft EIS

We recognize your concerns regarding bathrooms and wastewater near the ocean. The proposed Master Plan recommends installing an integrated water/wastewater/drainage system to maximize the efficiency and use of on-site water resources. It includes collecting rainwater and using treated wastewater for non-potable water uses to minimize demand for potable water, as well as restoring the 'auwai wherever possible and improving the drainage of surface runoff to irrigate surrounding garden areas or the lot if it can be appropriately filtered.

On-site wastewater disposal can potentially impact groundwater resources if not treated properly. Based on strong community preference, the Master Plan proposes that any new wastewater systems include a treatment system that brings wastewater to an R-2 water quality level at a minimum and to reuse the effluent as much as possible to minimize impacts to the sensitive natural and cultural resources at the park.

We also recognize your concerns regarding rockfall hazards at the park. A Rockfall Hazard Assessment was performed by AECOM during the months of August and September, 2008 and updated in 2013 with a supplemental rockfall analysis and computer simulation in the area between the main parking lot and Wai a Kanaloa. The health and safety impacts of rockfalls are proposed to be mitigated by siting all of the major visitor facilities and paths, including the Pedestrian Path to Kē'e, outside of the 0% chance of modeled rockfalls as mapped by AECOM in their Rockfall Hazard Assessment report (EIS Appendix B). Specifically, the Welcome Hale, Pedestrian Path, highway closure with signage and gates, and the main parking lot/shuttle improvements should be considered elements of rockfall mitigation and therefore prioritized in capital improvement project funding as they will shift the park's major visitor traffic away from the area of potential rockfall hazard. In addition, warning signs should be installed at appropriate locations at both ends of the highway and between the turnaround and Kē'e. Safety warnings should also be given during the visitor orientation session prior to park entry.

Mr. Jaybird Franey

IMPACT STATEMENT (EIS), HÄ'ENA, KAUAI, HAWAII  
Month XX, 2018  
Page 3

Mahalo for your suggestion of encouraging volunteerism at the park. The restoration and proper management of the park can improve the mental and physical well-being of those from the area or those with ancestral ties to the area or who participate in cultural activities here as there is a deep connection between them and this place. The Master Plan encourages the local community, Hä'ena families, and cultural and scientific experts to continue participating in the ongoing implementation and care for the park via the Cultural Advisory Group and broader community advisory group, as well as participation in future events and activities at the park such as educational programs and volunteer work days. As you stated in your comment, these volunteer opportunities will strengthen the sense of community responsibility and caring for the park.

We appreciate your comment supporting a limit to the number of visitors to the park. The revised master plan calls for an adaptive management approach for both the parking and the proposed visitor limits, which will be adjusted based on an average number of visitors rather than a set limit per day. As the State has more time to analyze user patterns, other options can be explored over time, and they are actively engaged in discussions regarding parking enforcement and increased fines along the roadway outside of the park as well. Please see the "Visitor Limits" attachment from Section 2.5.4.3 of the Final EIS, which shows the verbatim changes from the Draft EIS for this section

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oeqc2.doh.hawaii.gov/EA\\_EIS\\_Library/2018-09-14-FEIS-Haena-State-Park-Master-Plan.pdf](http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2018-09-14-FEIS-Haena-State-Park-Master-Plan.pdf) on 09/14/2018.

Aloha,

Kimi Mikami Yuen, LEED AP BD+C

Subject: the "plan for Haena"

as the owner of 5480 Weke Road in Hanalei, I strongly object to the plan you are contemplating for the solution to the obvious over crowding on the North Shore. The answer is not to make a Disneyesque bottleneck forcing tourists and regulars to flood the other available beaches. It would be more advisable to do a shuttle service, enforce the parking, raise taxes and ticket offenders and tow cars away. Making the North shore less natural, is never an answer for Kauai.... Please do not approve the current plan, we can and should do better. Jeff Ayeroff

Month XX, 2018 - DRAFT

Mr. Jeff Ayeroff  
5480 Weke Road  
Hanalei, HI 96714

SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUA'I, HAWAII

Aloha Mr. Ayeroff,

Mahalo nui for your emailed comment dated September 8, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your concerns regarding the impact park visitor limitation will have on other North Shore locations. We agree that a combination of a shuttle service, parking limits, and keeping the park as natural as possible will enhance the park's environmental and cultural resources while reducing strain and impact of visitor traffic and congestion to the North Shore area. We recognize negative effects of the master plan may include the distribution of recreational demand to other facilities on the North Shore and island-wide, especially the nearby Hā'ena Beach Park. State Parks should monitor use of Hā'ena County Park to judge if the recreational demand is shifted from one facility to the other. If so, an adjustment to the number of visitors allowed per day to Hā'ena State Park might be considered as a mitigating measure. If a shuttle is employed, a mitigation measure may be to include a stop at Hā'ena Beach Park to alleviate traffic and congestion at the County park as well.

The revised master plan calls for an adaptive management approach for both the parking and the proposed visitor limits, which will be adjusted based on an average number of visitors rather than a set limit per day. The main parking lot is proposed to be separated into a fee-paying lot and non-fee-paying lot, which will also be adjusted daily to allow flexibility depending on future demand for parking and the potential use of a proposed shuttle service. Please see the "Parking" attachment from the Final EIS, which shows the verbatim changes from the Draft EIS for these sections.

We recognize your concern regarding keeping the park as natural as possible. Only a few new structures are proposed, including a Welcome Hale that is envisioned as an open traditional Hawaiian hale and located near the improved main parking lot. Please see the revised Figure 1 Master Plan graphic and the "Master Plan Summary" attachment from Section 1.9.1 of the Final EIS, which show the verbatim changes from the Draft EIS in this section.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oeq2.doh.hawaii.gov/EA\\_EIS\\_Library/2018\\_HA-FEIS-Haena-State-Park-Master-Plan.pdf](http://oeq2.doh.hawaii.gov/EA_EIS_Library/2018_HA-FEIS-Haena-State-Park-Master-Plan.pdf) on 2018.

Aloha,

Kimi Mikami Yuen, LEED AP BD+C  
Principal

**To:** Lauren A. Tanaka@hawaii.gov; Kimi Yuen  
**Subject:** Comment: Ha'ena State Park Master Plan

Dear Government Officials and PBR Planning,  
Thank you for endeavoring to develop a conscientious and comprehensive master plan which balances conservation, recreation, cultural integrity, and public safety. And thank you very much for an opportunity where the public can express their input on this amazing place.

The Ha'ena State Park and Napali Coast State Wilderness Park are a Treasure, similar to the Hanauma Bay State Park, yet so much more! A unique spot offering beauty, wildness, cultural value, and recreational joy. Residents and visitors come to this place astounded by, enjoying and appreciating the raw wonder of the Napali, the beach, the fish, honu, monk seals, reef..., for cultural reasons, and recreation.

The public meeting in Hanalei introducing the master plan did not seem to address the following:

- \* The public would like to be more involved in creating a master plan.
- \* Residents ability to access the area at dawn and dusk for the beauty, nature, recreation as well as cultural reasons. How will they be able to gain fair access with a gate...?
- \* Many come just to enjoy the Napali Trail and access is through Ha'ena State Park. They do utilize the bathrooms and shower but their main focus is the Trail not Ha'ena State Park.  
The main focus at the meeting seemed to be cultural intention. And while this is very important, perhaps it is the Napali Trail and recreation that are the main attractors of this place. These activities need to have attention too which can bring wonderful opportunities for people to learn about Hawaiian culture.
- \* Traffic and parking in Ha'ena extends along right of ways because there is not enough parking at the State Park . Solutions may include allowing shuttles in addition to a limit of the number of cars **at any given time**. Tourism and Kauai population will continue to increase in the future. Thus having a higher environmentally sustainable limit at any one time **not** per day may make sense.
- \* Inviting donation (like they did at the Kilauea Lighthouse) or charging a nominal fee (like at Hanauma Bay) could offset the costs of maintenance. If charging fees, perhaps also offer a cheaper annual fee that residents could afford.

I could not find where the Master Plan is available for viewing. This site had it listed at the top of their information but I could not download it. <http://dlnr.hawaii.gov/dsp/announcements/public-input-sought-on-draft-master-plan-eis-for-haena-state-park/>

Mahalo nui loa for all you are doing to make a wonderful Master Plan, and for seriously taking into consideration the public's input.

With Gratitude,  
Jenna Haynie

Ms. Jenna Haynie  
SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN DRAFT ENVIRONMENTAL  
IMPACT STATEMENT (EIS), HĀ'ENA, KAUA'I, HAWAII  
Month XX, 2018  
Page 2

We recognize your concerns regarding cultural aspects of the master plan in relation to recreational activities at the park. An objective of the Master Plan is to balance outdoor recreational uses with the protection and preservation of the park's natural and cultural features in order to enrich the Hā'ena park experience for all.

We recognize your comments regarding parking concerns at the park. The main parking lot is proposed to be separated into a fee-paying lot and non-fee-paying lot, which will also be adjusted daily to allow flexibility depending on future demand for parking and the potential use of the proposed shuttle. Please see the "Parking" attachment from Section 2.5.1.2 of the Final EIS, which shows the verbatim changes from the Draft EIS for this section.

We recognize your comment regarding charging a nominal fee to help offset maintenance costs. Entry fees for state parks are established by Hawai'i Administrative Rules (HAR) 13-146-6, at the rate of \$5/car or \$1/person. HAR 13-146-6 also states that Hawai'i residents are exempt from paying park entry fees if they can show a valid Hawai'i ID. Other categories of fee exempt park users (such as registered volunteers) may be established at a later time.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oeqc2.doh.hawaii.gov/EA\\_EIS\\_Library/2018\\_KA-FEIS-Haena-State-Park-Master-Plan.pdf](http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2018_KA-FEIS-Haena-State-Park-Master-Plan.pdf) on 11/15/2018.

Aloha,

Kimi Mikami Yuen, LEED AP BD+C  
Principal

O:\0626\2627\01 DLNR-Haena State Park Master Plan\EIS\DEIS Responses\Mail Merge\2015-09-08 Haynie Email-Comment Haena State Park Master Plan - JS1.docx

Mr. and Mrs. Pierce Brosnan

September 8, 2015

Kimi Yuen, Senior Associate

PBR Hawaii

1001 Bishop Street

Suite 650

Honolulu, HI 96813

Aloha Ms. Yuen,

As long time residents of Haena, we are writing to voice our concerns about the current Haena State Park Master Plan Draft EIS.

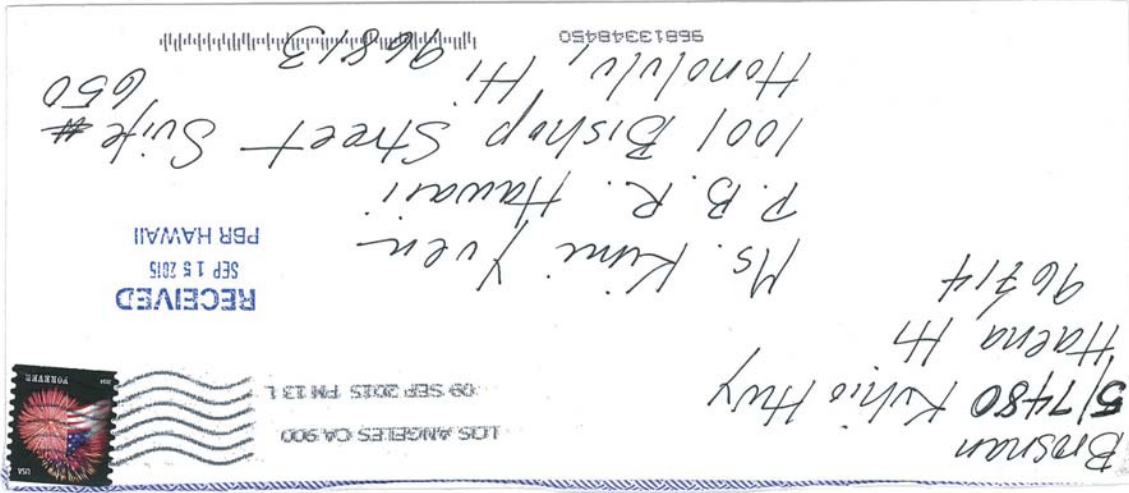

While we agree with limiting the amount of vehicles that visit Haena State Park daily, we do not feel comfortable with the current plan moving forward in light of the restricted access to residents. Additionally, we are concerned that restricting access to Ke'e will simply result in causing another problem in our community by over-crowding Makua Bay.

We believe that much could be solved by creating short term (4 hour) parking near the Lifeguard tower at Ke'e Beach Park and long term parking (overnight) for hikers in the large dirt lot (across from the Waikapalae & Waikanaloe wet caves). Paid parking, parking enforcement, hourly shuttles to and from the park and perhaps a toll booth with Park Rangers who encourage the visitor community (by handing out a pamphlet with every paid parking receipt) to be environmentally sensitive to our one-of-a-kind State Park could all assist in elevating the experience of visiting this cultural site while also protecting Haena State Park.

Thank you for your consideration of the above.

Mr. and Mrs. Pierce and Keely Brosnan  
SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN DRAFT ENVIRONMENTAL  
IMPACT STATEMENT (EIS), HĀ'ENA, KAUA'I, HAWAII  
Month XX, 2018  
Page 2

the different options with the advisory committee. More information on the proposed fee structure for parking is attached in Section 2.5.1.2 from the Final EIS.

In response to your comments regarding an hourly shuttle and parking enforcement, the new main parking lot is intended to alleviate the strain on current parking demand along with facilities designed to support the recommended shuttle service proposed. While the potential shuttle service is not proposed to be administered by State Parks in the revised master plan, it does include specific elements to support effective implementation with infrastructure design for the proposed park entry and main parking lot to support a recommended shuttle service with shuttle stop structures, as described in Section 2.5.1.1 and Section 2.5.1.2 from the Final EIS.

We acknowledge your suggestion for distribution of information through pamphlets on the cultural sites and environmentally sensitive areas of the park. The revised plan also includes proposals to provide information to all visitors prior to entry with availability at the Welcome Hale and online. The attached sections from the Final EIS on Visitor Orientation and Welcome Hale described the proposed provisions for information, which will educate visitors to the park on appropriate behavior for preserving the natural and cultural resources within the park.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://ceq2.doh.hawaii.gov/EA\\_EIS\\_Library/2018\\_KA-FEIS-Haena-State-Park-Master-Plan.pdf](http://ceq2.doh.hawaii.gov/EA_EIS_Library/2018_KA-FEIS-Haena-State-Park-Master-Plan.pdf) on 10/10/2018.

Mr. Pierce and Mrs. Keely Brosnan  
5-7480 Kuhio Highway  
Haena, HI 96714

SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUA'I, HAWAII

Aloha Mr. and Mrs. Brosnan,

Mahalo nui for your comment letter dated September 8, 2015 received via email and postal mail regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

Mahalo for your support of the vehicle limit aspects of the master plan. We recognize your concerns with local resident access and the potential impact on neighboring communities and beaches. The revised master plan proposes the 900-person visitor limit as an initial number which can be adaptively managed and adjusted as appropriate, especially if there continues to be unwanted impacts at the park and surrounding community. If there continue to be issues, State Parks will work with the advisory committee on adjusting the number and will also be conscious of unintended impacts on neighboring beaches similar to your concern regarding Makua Bay.

The proposed visitor limits will also be instituted only during peak hours of park use and will allow visitors to enter before and after without being counted against the visitor limit. Therefore, access will be allowed into the park outside those peak hours and will be adjusted as appropriate based on ongoing input from the community. There will also be exemptions from the visitor limit total for permitted overnight camping hikers and/or other special user groups. Please see the attached Section 2.5.4.3 from the Final EIS on the revised visitor limit proposal.

We also acknowledge your suggestions for short and long-term parking, parking fees and shuttle service. While there is no distinction between residents and nonresidents in the visitor limits, the main parking lot is proposed to be separated into a fee-paying lot and non-fee-paying lot. As the State has more time to analyze user patterns, other options can be explored over time, and they are actively engaged in discussions regarding parking enforcement and increased fines along the roadway outside of the park as well. Currently, entry fees for all state parks are established by Hawai'i Administrative Rules (HAR) 13-146-6, at the rate of \$5/car or \$1/person. HAR 13-146-6 also states that Hawai'i residents are exempt from paying park entry fees if they can show a valid Hawai'i ID. Similar fees could be instituted at Hā'ena State Park. However, State Parks will continue to work on

**Subject:** Haena Plan Proposition

To whom it may concern,

The proposed plan is a really bad idea...

How are you gonna tell locals they can't drive to to places they have driven their whole lives?

The real issue is tourists and rental cars, Kauai residents should not be punished...

I hope you will reconsider !

Thanks !

**SUBJECT: COMMENTS ON THE HÄ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HÄ'ENA, KAUAI, HAWAII**

Aloha Mr. Gottwald,

Mahalo nui for your emailed comment dated September 8, 2015 regarding the Hä'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hä'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your concerns with the Hä'ena State Park Master Plan from the perspective of local resident access and potential limitations on the number of visitors. We also acknowledge your comment concerning the impact of tourists and rental cars on the park. The draft version of the Master Plan has been revised to reflect feedback received from the community. Please see the attached **Master Plan Summary** from the Final EIS for reference to review the revisions to the plan.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oepc2.doh.hawaii.gov/EA\\_EIS\\_Library/2018--KA-FEIS-Haena-State-Park-Master-Plan.pdf](http://oepc2.doh.hawaii.gov/EA_EIS_Library/2018--KA-FEIS-Haena-State-Park-Master-Plan.pdf) on 2018.

**From:** Kaua'i Voice <aloha@kauaivoice.com>  
**Sent:** Tuesday, September 08, 2015 10:42 AM  
**To:** Lauren.A.Tanaka@hawaii.gov; Kimi Yuen  
**Subject:** Testimony for Ha'ena Master Plan

Aloha Ha'ena Master Plan Committee,

Mahalo nui for taking the time and effort to read all of our testimonies and utilize the priceless input of the community for the highest and best outcome for the Ha'ena Master Plan.

As someone who not only lives in Ha'ena but also is very active in protecting Kaua'i from further desecration, I continue to stand by my motto: protect what you love!

We ALL love Ha'ena. It truly is one of the most beautiful and sacred places on Earth. But this sacred spot does not only include Ha'ena, but ALL of Kaua'i. We have a very big problem here and therefore need very real solutions.

As we are aware, we have 67,000 residents and 1,372,682 visitors per year. This number alone should shock everyone. During the presentation you all gave at the Hanalei School, the basis for the Ha'ena Master Plan was to have an actual plan, the DLNR admitted to operating WITHOUT a plan all these years.

Yes: the Kanaka Ma'oli, the native Hawaiians, whos homeland we are graced to live upon, should head this Committee.

Yes: there is a huge problem that will only increase as the amount of visitors increase each year.

Yes: this situation is immense and takes all the Kaua'i ohana to fix it.

What is painful to see everyday is the sheer amounts of tourists to Ke'e. Hardly any room for locals to park. Hawaiians have constitutional right to access any part of Hawai'i for ceremonial or cultural purposes. Yet they have no where to park. The urban sprawl has made its way to Ha'ena and it is disgusting. Used baby diapers and trash strewn about. Hordes of sunscreen laden tourists naively frolicking on sacred ancient burial ground. WAY too many cars on our delicate archaic roads harming our fragile ecosystem.

As I continue to say in each of my testimonies, economy must never trump ecology!

Just because it is "good for tourism" does NOT mean it is good for the island and people of Kaua'i!

The truth is, ALL of Kaua'i is sacred and needs to be cared for by all the people, as was in ancient times. All of the residents of the North Shore love Kaua'i dearly and want our precious home island preserved for all present and future generations.

This issue goes far beyond shuttles and trashcans and transcends the greed of the few into the good for the whole.

Please note that We The People of Kaua'i stay vigilant. We stay awake and aware, and we will continue to use our voices and our wisdom.

All of Kaua'i is in jeopardy, and there needs to be laws in place to protect sacred Kaua'i from further desecration, whether it is from tourism, environmental chemical polluters, or even the military.

I speak on behalf of all present and future generations: PROTECT WHAT YOU LOVE!

<http://www.kauaivoice.com/#/Haena-Master-Plan-Community-Meeting/c17ij/55d687380c/f2174523e2c7e5>

Many of my colleagues have submitted very detailed ideas of how to handle the situation and I applaud everyone for finally bringing this most important issue to light.

Please, I implore you, HELP SAVE HA'ENA! It is the right thing to do.

We The People will be watching and will continue to use our voice.

What I suggest how to handle this problem is more community involvement. Here are just a few of my ideas:

- 1). Ha'ena Hui is formally started
- 2). REGULATE cars past Princeville. All hotels MUST provide shuttles and pay to repair these sacred sites since their visitors are destroying them.
- 3). STICKERS. Hawaiian cars have a special sticker that allows them access to everything. Kama 'aina stickers would show that people live here, are involved in the community, and their tax money is going to regulate this problem.
- 4). Tourist rental cars have NO sticker. NO STICKER means NO PARKING & NO ENTRANCE past Hanalei. Period. Either tourists park in Princeville and take the shuttle or don't go.
- 5). Hawaiian voices continue to speak up and claim their rightful heritage.
- 6). Kaua'i STOPS putting the good of the tourist above the good of the people.
- 7). This regulation should be less by the government and more by the We The People.
- 8). Embracing ancient Hawaiian ways of land stewardship and restoring the konohiki.

I understand that this is just the beginning and there is much work to do. Let us always remember:

**Ua Mau ke Ea o ka 'Āina i ka Pono:** The life of the land is perpetuated in righteousness".

Blessings of aloha to all of Kaua'i,

Mahana Mari

Month XX, 2018 - DRAFT

Ms. Mahana Mari  
P.O. Box 223231  
Princeville, HI 96722

**SUBJECT: COMMENTS ON THE HA'ENA STATE PARK MASTER PLAN DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS), HA'ENA, KAUAI, HAWAII**

Aloha Ms. Mari,

Mahalo nui for your emailed comment dated September 8, 2015 regarding the Ha'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Ha'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We appreciate your support of a potential limit on the number of visitors to the park. The revised master plan proposes the 900-person visitor limit as an initial number which can be adaptively managed and adjusted as appropriate, especially if there continues to be unwanted impacts at the park. If there continue to be issues, State Parks will work with the advisory committees on adjusting the number. **Please see the "Visitor Limits" attachment from Section 2.5.4.3 of the Final EIS, which shows the verbatim changes from the Draft EIS for this section.**

We recognize your concerns regarding the sacredness of Ha'ena State Park and the sacredness of the island of Kaua'i. Mahalo for your support of protecting, restoring, and perpetuating cultural aspects of Ha'ena State park. Preservation, restoration, and cultural use and reactivation of the park's historic and archaeological resources while providing quality opportunities for outdoor recreation are at the forefront of the proposed Master Plan.

The master plan has been designed to accommodate future third-party shuttle service programs. The development of these proposed programs will be an on-going coordination effort with private companies and County agencies.

We also recognize your concerns regarding the involvement of Hawaiian community groups, and traditional Hawaiian land stewardship. One of the key management recommendations is to establish a permanent Cultural Advisory Group and Community Advisory Committee. **These are described in Section 2.5.4.2 of the EIS and the verbatim description of these groups is included in the "Cultural and Community Advisory Group" attachment.**

We recognize your comments regarding traditional Hawaiian land stewardship and cultural practices. The master plan supports restoration of traditional cultural practices and methods. The primary physical mitigation measure of the master plan is to avoid cultural resources when locating new improvements and, where appropriate, enhance existing cultural and historic resources with restoration, interpretation, and cultural reuse. For example, new development in the Agricutural Complex is limited to facilities that support community gardening, such as a baseyard for equipment storage, which is located in previously disturbed areas where lo'i cannot be restored due to the condition of the soils.

Beneficial impacts to the cultural environment are expected from enabling cultural practices in the park through lo'i restoration and kalo cultivation; hula; traditional subsistence fishing; and caretaking of the Hula Complex and cemeteries. As a means to preserve access to cultural resources, perpetuate tradition, and provide essential maintenance of resources, State Parks has entered into a partnership with the Hui to curate the Agricutural and Hula Complexes. Additional partnerships will be encouraged to help manage other cultural resources within the park. In addition, the plan recommends that State Parks undertake separate efforts to work with cultural practitioners and the CAG to develop appropriate protocol for the park's cultural and historic resources, such as the Hula Complex, Agricutural Complex, and other archaeological/historic sites.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. **SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUAI, HAWAII**

Aloha Ms. Norman,

Mahalo nui for your emailed comment dated September 8, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your concerns with the Hā'ena State Park Master Plan from the perspective of local residents concerning potential restricted access and the potential impact on neighboring communities and beaches. The draft version of the master plan has been revised to reflect feedback received from the community and includes significant changes. The revised master plan proposes the 900-person visitor limit as an initial number which can be adaptively managed and adjusted as appropriate, especially if there continues to be unwanted impacts at the park and the surrounding community. If there continue to be issues, State Parks will work with the advisory committee on adjusting the number and will also be conscious of unintended impacts on neighboring beaches like your concern regarding damage to Makua Bay.

The proposed visitor limits will also be instituted only during peak hours of park use and will allow visitors to enter before and after without being counted against the visitor limit. Therefore, access will be allowed into the park outside those peak hours and will be adjusted as appropriate based on ongoing input from the community. There will also be exemptions from the visitor limit total for special user groups. Please see the attached **Section 2.5.4.3** from the Final EIS on the revised visitor limits proposed.

In response to your comments regarding parking enforcement and shuttle service, the parking improvements are intended to address parking enforcement with a parking fee structure for entry and facilities designed to support the recommended shuttle service. While the potential shuttle service is not proposed to be administered by State Parks in the revised master plan, it does include specific elements to support effective implementation with infrastructure design for the proposed park entry and main parking lot to support a recommended shuttle service with shuttle stop structures, as described in **Section 2.5.1.1** and **Section 2.5.1.2** from the Final EIS.

**Subject:** Haena State Park Plan

Dear Planners at PBR and Government Officials,

I attended the meeting in Hanalei concerning Haena State Park Plan. I feel the "conceptual" plan that was presented is extremely flawed. The main flaw is that it does not recognize nor plan for the simple access to the Napali State Park. Yes, Haena State Park is visited by a very large number of people every day but the mass majority of those people are not there to visit Haena State Park they are there to access the Napali Trail

I feel the plan needs to have unencumbered access to the Napali State Park and the Napali Trail. I feel that the Haena State Park needs to needs to work with the Napali State Park to provide this access. This would then make it easier to improve the Haena Park and save the heritage sites, cultural importance, and educate visitors about Haena State Park. This is a huge opportunity to make Haena State Park a shining example of what the Hawaiian Culture is all about with an attraction(Napali) that brings the visitors.

Thank you for your consideration.

Mitch Haynie  
Hanalei, HI

Month XX, 2018 - DRAFT

Mr. Mitch Haynie  
P.O. Box 11553  
Hanalei, HI 96714

**SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUA'I, HAWAII**

Aloha Mr. Haynie,

Mahalo nui for your emailed comment dated September 8, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your concerns regarding access to the Napali Trail and Napali State Park as well as consideration for users of the trail. We acknowledge that many visitors accessing parking at Hā'ena State Park are using the park as an access point to enter the Kalalau Trail. The proposed visitor limits in the revised master plan does not distinguish between individuals based on use of the park. However, the proposed plan excludes overnight hikers with valid permits using the Kalalau Trail from the total visitor limit. In addition, the revised master plan proposes that visitor limits will only be instituted during peak hours of park use and will allow visitors to enter before and after without being counted against the visitor limit. Therefore, access will be allowed into the park and parking lot outside of those peak hours and will be adjusted as appropriate based on ongoing input from the community.

The revised master plan proposes the 900-person visitor limit as an initial number which can be adaptively managed and adjusted as appropriate, especially if there continues to be unwanted impacts at the park and surrounding community. If there continue to be issues, State Parks will work with the advisory committee on adjusting the number. The attached **Section 2.5.4.3** from the Final EIS describe the revised visitor limits proposed.

We also acknowledge your comments on the opportunity to highlight the cultural sites within Hā'ena State Park for visitors accessing the Kalalau Trail. The revised plan also includes proposals to provide information to all visitors prior to entry as well as availability online. The revised proposals recommend options for informing visitors of appropriate behavior to preserve the natural and cultural resources in the park. Please see the attached **Section 2.5.4.5** from the Final EIS describing the proposed visitor orientation.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available

Month XX, 2018 - DRAFT

Mr. Neal Norman  
P.O. Box 752  
Kilauea, HI 96754

**SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUA'I, HAWAII**

Aloha Mr. Norman,

Mahalo nui for your emailed comment dated September 8, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your concerns with the Hā'ena State Park Master Plan Draft EIS and acknowledge your suggestions for shuttle service and parking enforcement. There have been several changes to the revised master plan. The draft version of the Master Plan has been revised to reflect feedback received from the community. Please see the **Master Plan Summary** from the Final EIS attached for reference with an overview of the revisions to the plan.

Mahalo for your suggestions for shuttle service from Princeville. While the potential shuttle service is not proposed to be administered by State Parks in the revised master plan, it does include specific elements to support effective implementation with infrastructure design for the proposed park entry and main parking lot to support a recommended shuttle service with shuttle stop structures, as described in **Section 2.5.1.1** and **Section 2.5.1.2** from the Final EIS.

Acknowledging your suggestions for parking enforcement, the revised master plan includes an entry fee structure for managing parking. The main parking lot is proposed to be separated into a fee-paying lot and non-fee-paying lot, which can be adaptively managed and adjusted daily as appropriate to allow flexibility depending on future demand for parking and the potential use of the proposed shuttle. The attached **Section 2.5.1.2** describes the revised master plan parking aspects in the Final EIS. We also acknowledge your comments on limiting rental cars on the island and raising taxing on rental cars, however these comments are beyond the scope of the Final EIS.

**Subject:** Haena State Park Master Plan Draft EIS

Aloha Ms. Yuen,

I am also NOT in favor of the plan moving forward in light of the restricted access to residents as well as the resulting damage to Makua bay.

I believe that much could be solved through parking enforcement, shuttles and encouraging the visitor community to be eco-sensitive.

Thank you,  
Patsy Nickum

Hanalei, HI 96714

**SUBJECT: COMMENTS ON THE HÄENA STATE PARK MASTER PLAN DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS), HÄ'ENA, KAUAI, HAWAII**

Aloha Ms. Nickum,

Mahalo nui for your emailed comment dated September 8, 2015 regarding the Hä'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hä'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your concerns with local resident access and the potential impact on neighboring communities and beaches. The revised master plan proposes the 900-person visitor limit as an initial number which can be adaptively managed and adjusted as appropriate, especially if there continues to be unwanted impacts at the park. If there continue to be issues, State Parks will work with the advisory committees on adjusting the number and will also be conscious of unintended impacts on neighboring beaches like your comments regarding damage to Makua Bay.

The proposed visitor limits will also be instituted only during peak hours of park use and will allow visitors to enter before and after without being counted against the visitor limit. Therefore, access will be allowed into the park outside those peak hours and will be adjusted as appropriate based on ongoing input from the community. Please see the attached **Section 2.5.4.3** from the Final EIS on the revised visitor limit proposal.

We also acknowledge your suggestions for parking enforcement and shuttle service, as well as providing information on the environmentally sensitive areas of the park. While the potential shuttle service is not proposed to be administered by State Parks in the revised master plan, it does include specific elements to support effective implementation with infrastructure design for the proposed park entry and main parking lot to support a recommended shuttle service with shuttle stop structures, as described in the sections on **Park Entry** and **Parking** from the Final EIS. The revised plan also includes proposals to provide information to all visitors prior to entry with availability at the Welcome Hale and online. The attached **Section 2.5.4.5** and **Section 2.5.1.3** from the Final EIS describe the proposed provisions for public information, which will educate visitors to the park on appropriate behavior for preserving the natural resources within the park.

Mahalo nui for your input and participation in the environmental review process. Your

Month XX, 2018 - DRAFT

Ms. Robin Cottle  
5-5851 Kuhio Highway  
Hanalei, HI 96714

**SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUA'I, HAWAII**

Aloha Ms. Cottle,

Mahalo nui for your emailed comment dated September 8, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your concerns with overcrowding and the impact on the ecosystem around Ke'e Beach. We also acknowledge your suggestions for parking enforcement and shuttle service, as well as regulating access with entrance fees and educating the public on the culturally and environmentally sensitive areas of the park.

In response to your comments regarding shuttle service, the proposed park entry and main parking lot includes facilities designed to support the recommended shuttle service. While the potential shuttle service is not proposed to be administered by State Parks in the revised master plan, it does include specific elements to support effective implementation with infrastructure design for the proposed park entry and main parking lot to support a recommended shuttle service with shuttle stop structures. Please review **Section 2.5.1.1** and **Section 2.5.1.2** from the Final EIS describing proposed facilities at the main parking lot for shuttle stops.

Acknowledging your suggestions for entrance fees and parking enforcement, the revised plan includes proposed main parking lot design with controlled entry and flexibility depending on future demand for parking and the potential use of the proposed shuttle. Entry fees for state parks are established by Hawai'i Administrative Rules (HAR) 13-146-6, at the rate of \$5/car or \$1/person. HAR 13-146-6 also states that Hawai'i residents are exempt from paying park entry fees if they can show a valid Hawai'i ID. Similar fees could be instituted at Hā'ena State Park, however, State Parks will continue to work on the different options with the advisory committee. More details on parking is attached in **Section 2.5.1.2** from the Final EIS.

We also acknowledge your suggestion for distribution of information through pamphlets on the cultural sites and environmentally sensitive areas of the park. The revised plan also includes proposals to provide information to all visitors prior to entry with availability at

Page 2

the Welcome Hale and online. The attached sections from the Final EIS on **Visitor Orientation** and **Welcome Hale** described the proposed provisions for information, which will educate visitors to the park on appropriate behavior for preserving the natural and cultural resources within the park.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. **Subject:** Hana Ke'e plan - Don't approve!

Aloha,

I grew up in Haena and Ke'e is special to me and my ohana.

The current proposal is not a plan I support nor think is a good solution.

The main issue - the number of parking stalls has dimensioned substantially over the years. At the same time, the number of rental cars has increased dramatically.

My solution is simple and way cheaper to implement then the current proposal.

- 1) expand parking area slightly around the bathrooms.
- 2) Create parking fee's (meters) for non residents.
- 3) Create Free parking stalls for residents.
- 4) Funds generated from fees can support the job of the parking enforcement.
- 5) Pave additional overflow parking area by blueroom area. Same Meter/local free parking scenario.

Seems simple enough with out damaging the unique area that is Ke'e.

PLEASE DO NOT APPROVE THE KE'E PLAN AS WRITTEN!

Mahalo  
Ryan

Month XX, 2018 - DRAFT

Mr. Ryan Siebring  
Via Email: siebring@me.com

**SUBJECT: COMMENTS ON THE HÄ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HÄ'ENA, KAUAI, HAWAII**

Aloha Mr. Siebring,

Mahalo nui for your emailed comment dated September 8, 2015 regarding the Hä'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hä'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your concerns with the Hä'ena State Park Master Plan Draft EIS and your comments highlighting the growing constraints on current parking stalls coupled with an increasing volume of rental cars as well as your suggested solution to avoid "damaging" the park. The draft version of the master plan has been revised to reflect feedback received from the community and includes significant changes with minimal physical improvements to preserve the natural beauty of the park. Please see the **Master Plan Summary and Figure 1** from the Final EIS attached for reference with an overview of the revisions to the plan.

Mahalo for your suggestions to expand the parking area, create parking fees for nonresidents, and generate revenue through parking enforcement. Similar to your suggested parking fee designations, the main parking lot is proposed to be separated into a fee-paying lot and non-fee-paying lot. As the State has more time to analyze user patterns, other options can be explored over time, and they are actively engaged in discussions regarding parking enforcement and increased fines along the roadway outside of the park as well. Currently, entry fees for all state parks are established by Hawai'i Administrative Rules (HAR) 13-146-6, at the rate of \$5/car or \$1/person. HAR 13-146-6 also states that Hawai'i residents are exempt from paying park entry fees if they can show a valid Hawai'i ID. Similar fees could be instituted at Hä'ena State Park. However, State Parks will continue to work on the different options with the advisory committee. More information on the park entry, parking improvements, and proposed fee structure for parking is attached in **Section 2.5.1.1** and **Section 2.5.1.2** from the Final EIS.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oeqc2.doh.hawaii.gov/EA\\_EIS\\_Library/2018--KA-FEIS-Haena-State-Park-Master-Plan.pdf](http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2018--KA-FEIS-Haena-State-Park-Master-Plan.pdf) on 9/15/2018.

**Subject:** Stern Opposition to any FIXING you have in mind for Kauai north shore

Please register my stern opposition to your proposed interventions and presence on the North Shore of Kauai. As a tax paying full time resident of Kauai county for the last 5 years I am opposed to anything BUT your parking expansion and parking improvements to KEE beach area.

ALL OTHER so called improvements are not welcome. Leave the pristine area alone and keep govt hands and ordinances away...we are better off in total with things as they are than they will be after you get your hands on it. Please stay OUT!

**SUBJECT: COMMENTS ON THE HÅ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HÅ'ENA, KAUAI, HAWAII**

Aloha Mr. Wright,

Mahalo nui for your emailed comment dated September 8, 2015 regarding the Hå'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hå'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your comments regarding improvements to the state park outside of parking expansion and parking improvements. The "no change" (or No Action) alternative was evaluated and rejected outright due factors that include the potential for continued degradation of cultural and natural resources, the worsening traffic and parking congestion that would occur if nothing were done, and potential risk of rockfalls and threats to public safety.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at

[http://oecq2.doh.hawaii.gov/EA\\_EIS\\_Library/2018-04-04-FEIS-Haena-State-Park-Master-Plan.pdf](http://oecq2.doh.hawaii.gov/EA_EIS_Library/2018-04-04-FEIS-Haena-State-Park-Master-Plan.pdf) on 04/04/2018.

Aloha,

**To:** Kimi Yuen  
**Subject:** Ha'ena Master Plan testimony

Aloha, to whom it may concern,  
My name is Yogi Lacock and i'm lucky enough to be born and raised in Haena. Over the years I've seen a lot of changes on the island but nothing as drastic as the Ke'e Master plan that is being proposed. I'm paralyzed in a wheelchair due to an accident I had 17 years ago when I was 19 years old but I have a 10-year-old son and six-year-old daughter that I'm so thankful get to grow up here on the North Shore of this beautiful island. Yes it's true there's a bit of congestion at Ke'e especially in the mid day and busy season but most of the cars down there keep the crowds spread out, from the people down the coast to the people hanging out on the beach there to all the cars just pulling up taking a quick picture and turning around. It would be a major mistake to try and regulate the cars that go down there and if people are concerned with the congestion I really believe the simplest solution would just be to add more parking or to reopen the back parking lot. If people can't park down there they're just going to turn around and go park at tunnels which would just create a whole new set of problems. Ke'e is honestly my favorite place to pull up at the beach with my kids kick back relax watch sunset cruise with friends. The crowds there have never really bothered me and all the locals know to go in the morning evenings and off-season to avoid the crowds. Please reconsider your big master plan and just add a bit more parking or reopen the back parking lot, it's definitely the easiest and most effective solution for the problem. Thanks for your attention to this matter.

Mahalo

**SUBJECT: COMMENTS ON THE HA'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HA'ENA, KAUA'I, HAWAII**

Aloha Mr. Lacock,

Mahalo nui for your emailed comment dated September 8, 2015 regarding the Ha'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Ha'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your concerns with regulating vehicle access and the potential impact on neighboring communities and beaches, such as Tunnels, Mahalo for your suggestions to expand parking and reopening the back parking lot. Similar to your suggested parking expansion, the revised master plan includes several parking improvements, as well as park entry design with a turnaround to mitigate congestion. The new main parking lot expansion is intended to alleviate the strain on current parking demand along with facilities designed to support the recommended shuttle service. The proposed gate installation is designed as a safety precaution from the rockfall hazard on the existing road. While the existing corridor between the proposed park entry turnaround and Ke'e Beach will be restricted to the general public due to the rockfall hazard, access will be permitted for special user groups such as lifeguards and those with ADA parking placards. Please review the attached [Section 2.5.1.1](#) and [Section 2.5.1.2](#) from the Final EIS describing the park entry and parking improvements. You will also find more details on the rockfall hazard and limited access corridor in [Section 2.5.1.8](#) and [Section 3.10.5](#) from the Final EIS.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oeqc2.doh.hawaii.gov/EA\\_EIS\\_Library/2018-09-KA-FEIS-Haena-State-Park-Master-Plan.pdf](http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2018-09-KA-FEIS-Haena-State-Park-Master-Plan.pdf) on 09/08/2018.

**Subject:** comments for Kee Beach on Kauai

Aloha to whom it may concern,

I am a 40 year resident to the Haena area on Kauai. I have 3 generations of family here in Haena and on Kauai. I am very opposed to having a gate at Kee beach, or any kind of buildings. Turning away people is not the answer. Where would they go? This will cause a choking of the other Haena beaches as there is not any parking available at any of those beaches either. It will result in just moving the problem to a new location down the road.

I feel a good solution would be to have shuttle vans, like a park and ride to the north shores beaches. Park and rides are all over the mainland, we don't need to re-create the wheel. If you have shuttle vans, the tourists can park at a location that has room for all the cars, and then can take a shuttle to Kee for the beach and also for the hikers. Then no one gets turned away, and there is not a parking problem at the end of the road. There is room in Princeville for a parking lot. I realize the devil is in the details, but I truly believe that there is a better solution than putting up a gate and turning away people.

Thank you for taking the time to read my opinion.

Month XX, 2018 - DRAFT

Ms. Acacia Morrison  
P.O. Box 687  
Hanalei, HI 96714

**SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUAI, HAWAII**

Aloha Ms. Morrison,

Mahalo nui for your emailed comment dated September 9, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your concerns with the proposed gate installation and potential impact on neighboring communities and beaches. Due to the rockfall hazard proximity along the existing road, the proposed plan calls for a gate to restrict vehicle access along the corridor between the proposed park entry turnaround and Ke'e Beach, and will only be permitted for special user groups such as lifeguards and those with ADA parking placards. The revised master plan also calls for gate design to be visually open to minimize the aesthetic impact for views toward Ke'e Beach. In response to your concerns over overflow impacts on the community, State Parks will continue working with the advisory committee to monitor conditions and will also be conscious of unintended impacts on neighboring beaches similar to your comments. The attached [Section 2.5.1.8](#) and [Section 2.5.1.1](#) from the Final EIS provide a description of the revised master plan pertaining to the Park Entry and Limited Access Corridor. Additional information on the Rockfall Hazard is provided in [Section 3.10.5](#) from the Final EIS.

We recognize your concern with the originally proposed buildings as well. The revised master plan includes significant changes and minimal physical improvements to preserve the natural beauty of the park. Most of the proposed buildings in the draft master plan have been removed in the revised master plan to reflect feedback received from the community. Please see the [Master Plan Summary](#) from the Final EIS attached for reference with an overview of the revisions to the plan.

Mahalo for your suggestions to include "park and ride" shuttle service from Princeville. While the potential shuttle service is not proposed to be administered by State Parks in the revised master plan, it does include specific elements to support effective implementation with infrastructure design for the proposed park entry and main parking lot to support a recommended shuttle service with shuttle stop structures, as described in [Section 2.5.1.1](#) and [Section 2.5.1.2](#) from the Final EIS.

SUBJECT: COMMENTS ON THE HÄ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HÄ'ENA, KAUA'I, HAWAII

Aloha Ms. Smith,

Mahalo nui for your emailed comment dated September 9, 2015 regarding the Hä'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hä'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your concerns with the originally proposed plans for Hä'ena State Park. There have been significant revisions from the original draft and the Master Plan has been revised to reflect feedback received from the community. Please see the attached **Master Plan Summary** from the Final EIS for reference with an overview of the revisions to the plan.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oeqc2.doh.hawaii.gov/EA\\_EIS\\_Library/2018--KA-FEIS-Haena-State-Park-Master-Plan.pdf](http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2018--KA-FEIS-Haena-State-Park-Master-Plan.pdf) on 2018.

Locals should have open access to  
local beaches. Do not clamp locals  
into the group of "900". Mahalo

Month XX, 2018 - DRAFT

Ms. Barb Douglass  
P.O. Box 1654  
Hanalei, HI 96714

**SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUA'I, HAWAII**

Aloha Ms. Douglass,

Mahalo nui for your comment card received on September 9, 2015 in response to the public meeting held on August 19, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your concerns with the Hā'ena State Park Master Plan from the perspective of local residents regarding beach access and potential limitations on the number of visitors. The draft version of the Master Plan has been revised to reflect feedback received from the community. Please see the [Master Plan Summary](#) from the Final EIS attached for reference with an overview of the revisions to the plan.

We acknowledge your concern over inclusion of local residents in the proposed visitor limits, however there is not a distinction in the revised master plan between residents and nonresidents. The revised master plan proposes the 900-person visitor limit as an initial number which can be adaptively managed and adjusted as appropriate, especially if there continues to be unwanted impacts at the park. State Parks will continue to work with the advisory committee to assess potential adjustments to the number. The limits will also be instituted only during peak hours of park use and will allow visitors to enter before and after without being counted against the visitor limit. Therefore, access will be allowed into the park outside those peak hours and will be adjusted as appropriate based on ongoing input from the community. There will also be exemptions from the visitor limit total for special user groups from the community. Please reference the attached [Section 2.5.4.3](#) from the Final EIS for a description of these aspects within the revised master plan.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oeq2.deh.hawaii.gov/EA\\_EIS\\_Library/2018-04-KA-EIS-Haena-State-Park-Master-Plan.pdf](http://oeq2.deh.hawaii.gov/EA_EIS_Library/2018-04-KA-EIS-Haena-State-Park-Master-Plan.pdf) on 04/18/2018.

**SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUA'I, HAWAII**

Aloha E. Bendor,

Mahalo nui for your comment card received on September 9, 2015 in response to the public meeting held on August 19, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your concerns with the Hā'ena State Park Master Plan Draft EIS and acknowledge your suggestions for additional parking and shuttle service from Princeville. The new main parking improvements are intended to alleviate the strain on current parking demand, with key management recommendations for adapting to future parking demand and the potential use of the proposed shuttle. A description of parking improvements proposed is attached in [Section 2.5.1.2](#) from the Final EIS.

Acknowledging your suggestion for shuttle service from Princeville, the proposed facilities in the plan have been designed to support potential shuttle service recommended as well as a proposed turnaround at the entry to reduce congestion. While the potential shuttle service is not proposed to be administered by State Parks in the revised master plan, it does include specific elements to support effective implementation with infrastructure design for the proposed park entry and main parking lot to support a recommended shuttle service with shuttle stop structures, as described in [Section 2.5.1.1](#) and [Section 2.5.1.2](#) from the Final EIS.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oeqc2.doh.hawaii.gov/EA\\_EIS\\_Library/2018-18-KA-HEIS-Haena-State-Park-Master-Plan.pdf](http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2018-18-KA-HEIS-Haena-State-Park-Master-Plan.pdf) on 2018.

Hā'ena State Park Master Plan | Draft EIS Community Meeting | August 14, 2015

Please share your comments on the Hā'ena State Park Master Plan Draft EIS.  
(If you would like a written response letter, please include your mailing address.)

State or Federal money should fund the shuttle  
system to get people past Hanalei -  
Tourists staying in Princeville should be shuttled  
to Kēe, Tunnels, Lūmaluāi and Hanalei - With  
shore hotels and condos should provide transport from  
airport to N. shore - then shuttles should move tourists  
around the N. shore -  
Līmaehuli gardens has a visitor center that  
explains local history, culture -  
money should be spent on shuttle system -  
Park should not be limited to 800 people  
just set rid of tourists in rental cars

Month XX, 2018 - DRAFT

Mr. Michaelle Edwards  
3812 Alonui Place  
Princeville, HI 96722

**SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAU'A'I, HAWAII**

Aloha Mr. Edwards,

Mahalo nui for your comment card dated September 9, 2015 from the community meeting held on August 19, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your comments regarding the possibility of a shuttle for the park master plan. A proposed third-party shuttle service has been analyzed as a part of the project's traffic impact assessment report, included in the EIS as Appendix F. The preferred scenario is to implement a third-party shuttle from the Princeville facility at the start of Phase I, minimizing the need for visitor parking in the parking lot in the park. Please see the "Shuttle Service" attachment from Section 4.3.3 of the Final EIS, which shows the verbatim changes from the Draft EIS for this section.

We also recognize your concerns regarding the implementation of potential park visitor limits. The revised master plan calls for an adaptive management approach for both the parking and the proposed visitor limits, which will be adjusted based on an average number of visitors rather than a set limit per day. The limits will also be instituted only during peak hours of park use and will allow visitors to enter before and after peak hours without being counted against the visitor limit. Please see the "Visitor Limits" attachment from Section 2.5.4.3 of the Final EIS, which shows the verbatim changes from the Draft EIS for this section.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oeq2.deh.hawaii.gov/EA\\_EIS\\_Library/2018-18-KA-FEIS-Haena-State-Park-Master-Plan.pdf](http://oeq2.deh.hawaii.gov/EA_EIS_Library/2018-18-KA-FEIS-Haena-State-Park-Master-Plan.pdf) on 2018.

---

This is in regards to the Haena State Park Master Plan public comment.

Make sure the entire island community is involved, we all use the area. From what I see there's special interest groups being involved, make sure the Haena and Hanalei community wants this plan. They live there and they should ALL have a fair say in what is being planned.

Aloha

Ms. Shyla Moon  
Via Email: shyla.moon@gmail.com

**SUBJECT: COMMENTS ON THE HÄ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HÄ'ENA, KAUA'I, HAWAII**

Aloha Ms. Moon,

Mahalo nui for your emailed comment dated September 8, 2015 regarding the Hä'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hä'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your comments concerning the need for consideration of feedback from the Hä'ena and Hanalet community and concern with the involvement of special interest groups. The planning process involved a collaborative approach to support the development of the master plan by consulting various local community groups and individuals, including a thirty-two member Master Plan Advisory Committee (MPAC) consisting of Hä'ena kūpuna and 'ohana members, cultural practitioners and scientific experts, business representatives, State and County agencies, and other North Shore community members to provide recommendations on the physical plan and park management. The environmental review process has also included opportunities for public comment throughout the process. In addition, State Parks held a public meeting on August 19, 2015 to gather more input and extended the Draft EIS public comment period to allow more time for feedback from the community before revising the master plan. Please see the attached **Section 1.6** and **Section 1.7** from the Final EIS describing community engagement and environmental review process. One of the key management recommendations is to establish a permanent Cultural Advisory Group and Community Advisory Committee. These are described in **Section 2.5.4.2** of the Final EIS and the verbatim description of these groups is included in the "Cultural and Community Advisory Groups" attachment.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://osqe2.doh.hawaii.gov/EA\\_EIS\\_Library/2018--KA-HEIS-Haena-State-Park-Master-Plan.pdf](http://osqe2.doh.hawaii.gov/EA_EIS_Library/2018--KA-HEIS-Haena-State-Park-Master-Plan.pdf) on **Month XX, 2018**.

**Subject:** Proposed Ke'e Master Plan

---

Dear Ms. Tanaka,  
I am writing in regard to the proposed Ke'e Master Plan. As a long time Kauai resident

(since 1976) and Haena resident (since 1990), I am always pleased to see community input into island planning. I reviewed the 1,000 + page proposed plan and commend the members of the community who spent so much time to take so many issues into consideration. However, I was surprised at the amount of proposed "development" (the visitor center, boardwalks, ranger's house, signage, etc) which, I feel, is inappropriate in a Conservation area. The idea of a Conservation area it to restrict development, not increase it. Our real issue at Ke'e is parking. There are simply too many vehicles. I fully support limiting the number of vehicles, offering a public form of transportation, and charging a fee for hourly parking. While educating residents and visitors about the cultural history and resources of the area is necessary, I feel this could be done by printing an educational pamphlet that could handed out at the parking site. Bottom line, please restrict vehicles and development. Keep the Conservation area in Conservation. Mahalo.

SUBJECT: COMMENTS ON THE HÄ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HÄ'ENA, KAUA'I, HAWAII

Aloha Ms. Tico,

Mahalo nui for your emailed comment dated September 9, 2015 regarding the Hä'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hä'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

Mahalo for your support of the aspects of the master plan to limit the number of vehicles and your support for community input incorporated into the master plan. We recognize your concerns with the originally proposed "development" and desire to preserve the park for conservation. The revised master plan includes significant changes and minimal physical improvements to preserve the natural beauty of the park. Most of the proposed buildings, including the visitor center, and caretaker's cottage, have been removed in the revised master plan. The master plan includes many aspects to restore the natural environment of the park as well and the master plan has been revised to reflect feedback received from the community. Please see the Master Plan Summary from the Final EIS attached for reference with an overview of the revisions to the plan.

We also acknowledge your concern with parking as well as your suggestions for parking fees and shuttle service. Acknowledging your suggestions for parking fees, the revised plan includes proposed main parking lot design with controlled entry and flexibility depending on future demand for parking and the potential use of the proposed shuttle. Entry fees for state parks are established by Hawai'i Administrative Rules (HAR) 13-146-6, at the rate of \$5/car or \$1/person. HAR 13-146-6 also states that Hawai'i residents are exempt from paying park entry fees if they can show a valid Hawai'i ID. Similar fees could be instituted at Hä'ena State Park, however, State Parks will continue to work on the different options with the advisory committee. More details on parking is attached in Section 2.5.1.2 from the Final EIS.

While the potential shuttle service is not proposed to be administered by State Parks in the revised master plan, it does include specific elements to support effective implementation with infrastructure design for the proposed park entry and main parking lot to support a recommended shuttle service with shuttle stop structures, as described in Section 2.5.1.1

and Section 2.5.1.2 from the Final EIS.

We also acknowledge your suggestion for providing information through educational pamphlets on the cultural history and resources at the park to be distributed at the parking areas. The revised plan also includes proposals to provide information to all visitors prior to entry with availability at the Welcome Hale and online. The attached sections from the Final EIS on Visitor Orientation and Welcome Hale described the proposed provisions for information, which will educate visitors to the park on appropriate behavior for preserving the natural and cultural resources within the park.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oeq2.doh.hawaii.gov/EA\\_EIS\\_Library/2018\\_KA-EIS-Haena-State-Park-Master-Plan.pdf](http://oeq2.doh.hawaii.gov/EA_EIS_Library/2018_KA-EIS-Haena-State-Park-Master-Plan.pdf) on 10/15/2018.

Aloha,

Kimi Mikami Yuen, LEED AP BD+C  
Principal

**Attachments:** Haena park plan comments.docx

Aloh. Although I missed submitting this by the deadline yesterday, I wanted to submit my comments on the DEIS of the Park Master Plan anyway. I hopes that my comments add to a better approach to the Park Master Plan.  
Mahalo,  
Beau Blair  
beausephine@hawaii.rr.com

Aloha Div. of State Parks & Ms Yuen

I am submitting these comments to you re: the DEIS on the Haena State Park Plan.

I was at the meeting at the Hanalei School where Ms Yuen made her presentation, and I also attended some of the earlier meetings re: input on the Master Plan, although I am not a member of the CAC.

My comments are as follows:

This Ha'ena State Park Master Plan does not take into account the sum total environmental impacts on the local and resident population. Currently, when all of the tourist visitors that cannot access Ke'e are turned away, they already tidal wave backwards, into the beaches that lead up to Ke'e. These other beaches are not equipped with sufficient parking and bathrooms for the excessive amount of tourists that are here presently. The Ke'e Park Plan has limited car access, and when cars are forced back to Haena Beach Park, it will certainly not deter people from accessing Ke'e via the beach, from Maniholo to Ke'e. This would be devastating to the last small area of somewhat quiet beach left primarily to residents. Our beaches and our community are currently under "full attack" due to exploitation by tourist business and tourists.

- This plan does not allow for residents who are neither a Hawaiian kumu nor fishermen, who may be unable to "volunteer" in order to be able to have access to their neighborhood resource. Long-time Kama'aina have enjoyed the use of Ke'e for many years, until it became over-run with tourists. It does not seem just to restrict those who have paid taxes but are being given no consideration in this plan to utilize the resources as well. Residents are the ones who malama the beaches and reefs, by virtue of caring for their backyard, but now residents have been over-run by too many visitors.
- There is mention of shuttles, but no requirements that all park-goers use them for going through the "rural roadway corridor" that leads from Hanalei to Ha'ena.
- Limiting the access to tourists and their vehicles will also set up a system that encourages people to "que up" earlier & earlier in

- order to be able to gain access, if shuttles are not a requirement for visitor access. This is a common result in parks all over the world that have limited access.
- If you restrict access via pre-sale passes or on-line permits, the State is doing to the residents the exact same thing that has happened with camping permits on the Na Pali. Many tourists plan ahead for their trips, and those of us who have to or choose to be spontaneous have lost the ability to go camping, because we are unable to procure permits on a short-term time frame. All the permits are being taken long in advance. If a resident goes camping without a permit, they are liable for immense fines. The State needs to factor this in before further restricting local access to parks and recreational areas, and this is a real problem that needs to be addressed.
  - The turnaround area is a good idea, but the rest of the "build-out" is neither respectful of the natural beauty, nor necessary to protect and preserve the park. A 24hr care-taker is not necessary, and neither is a large visitor education center. "Cold Pond" in Limahuli stream is an oasis for local families, and there is no mention of how to protect this place for local access and prevent it from the backflow of the visitor turn-around.
  - It is clear that the money for this grand plan is not all available, and the State of Hawaii historically does not manage its' parks or finances well. Without the full funding for a complete plan, this Master Plan is not going to alleviate the problems at Ke'e, and could possibly intensify them.
  - I wish I could say that this plan just had a few problems, but I feel that is not the case. This DEIS does not address the myriad of issues that go along with the problems at Ke'e.
  - The restriction of tourists coming to the island via specific quota would allow the resources to be better managed. Enforcement by police of parking restrictions and violations on the State Hwy 560, and making sure on a constant basis that emergency access routes are clear for the emergency vehicles would be very productive.
  - I am aware that because it is a State Park with Federal funding, there can be no distinction in this plan between local resident use and tourist use. But that is frustrating to me because the park is located at the end of a residential area- one that we all want to cherish and enjoy.

- To me, this plan is not work-able as presented.

Mr. Beau Blair  
P.O. Box 421  
Hanalei, HI 96714

SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUA'I, HAWAII

Aloha Mr. Blair,

Mahalo nui for your emailed comments dated September 9, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We understand your concerns regarding parking, the potential limitations on the number of visitors, and the potential impact on neighboring communities and beaches. The revised master plan also calls for an adaptive management approach for parking and the proposed visitor limits, which will be based on an average number of visitors rather than a set limit per day. Should the impacts to the surrounding beach areas occur, the visitor limit could be adjusted to relieve the pressure on the beaches leading up to Kē'e.

We also acknowledge your overall concern with the impact of tourism on the area and loss of access for residents to their neighborhood resources. The visitor limit is proposed only during peak hours of park use and early morning and late afternoon arrivals would not be included in the limit to support resident access to the park. The plan supports those who help take care of the place and would not include those who do in visitor limits as well.

The original Master Plan Advisory Committee proposed the requirement that all park goers arrive by shuttle from a remote Princeville entry point. However, some members of the community felt that was too inconvenient, especially if they lived closer to the park. The revised master plan supports shuttle use and includes a shuttle stop at the turnaround to provide a place where shuttle riders can be dropped off and picked up.

We recognize your concern that the visitor and parking limits will encourage visitors to arrive earlier and earlier, which is why key management recommendations include adaptively managing all park policies, such as park entry, parking management, and the visitor limits. Please see Section 2.5.4 of the attached Description of the Master Plan. This will allow State Parks to revise any management policy that is not working and to consult with the HSPCAC on the impacts to the community and work together on solutions.

We recognize your concerns that access for local residents will be more difficult with pre-sale and ticketing availability online that may favor tourists planning well in advance of arrival to the park. As mentioned previously, the revised plan proposes visitor limits only during peak hours and alternatives for park entry can be explored through adaptive management as long as they do not violate the Land and Water Conservation Fund rules, which do not allow residents to be favored over nonresidents in ticket availability.

Mahalo for your support for the turnaround proposed at the park entry. We have revised the master plan and removed the Education and Cultural Center and Carstaker's Cottage in response to help preserve the openness and natural beauty of the park. Please see the revised Figure 1 showing the updated master plan graphic from the Final EIS. We have also attached the Description of the Master Plan section from the Final EIS, which shows the verbatim changes from the Draft EIS. You may download a full copy of the master plan report at the State Parks website for Hā'ena State Park: <http://dlhr.hawaii.gov/dsp/parks/kaui/haena-state-park/>.

We also recognize your concern related to the Limahuli Stream Cold Pond and the revised master plan includes preservation and restoration proposals for Limahuli Stream in Section 2.5.1.14 of the above Description of the Master Plan. However, similar to access and park use in general, protection and use of Cold Pond cannot be limited to residents only. We acknowledge the feeling of loss and concern for it being overrun with visitors. However, restoration and protection of these natural resources is recommended for everyone's enjoyment and primarily for the health of that stream ecosystem.

We understand your concerns with funding and implementation of the proposed plan. As you note, the timing and funding strategies have not been finalized; however the revised master plan has been simplified with fewer large-scale facility improvements. We also recognize your concerns regarding the plan as presented in the Draft EIS. State Parks worked with a reorganized HSPCAC to revise the plan based on the input gathered from the community.

We also acknowledge your comments on restricting tourism on the island with a quota and parking enforcement on State Highway 560. However, this is beyond the scope of the Hā'ena State Park Master Plan EIS. During the master plan process, we learned enforcement is a jurisdictional issue and the State and County officials have been working together to address the issue of keeping State Highway Route 560 open for emergency vehicles. As you mentioned in your comments, proposed visitor access cannot distinguish between residents and tourist groups and understand your frustration. However, the plan recommends actively and adaptively managing the park to encourage solutions that can evolve over time and working closely with the community and cultural advisory groups.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oeqc2.doh.hawaii.gov/EA\\_EIS\\_Library/2018\\_KA-EIS-Haena-State-Park-Master-Plan.pdf](http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2018_KA-EIS-Haena-State-Park-Master-Plan.pdf) on 2018

Aloha Ms. Yuen,

We are not in favor of the plan moving forward in light of the restricted access to residents as well as the resulting damage to Makua bay.

We believe that much could be solved through parking enforcement, shuttles and encouraging the visitor community to be eco-sensitive.

Thank you,

Jake & Jennifer Kilgrow

SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUA'I, HAWAII

Aloha Mr. and Mrs. Kilgrow,

Mahalo nui for your emailed comment dated September 9, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your concerns with the Hā'ena State Park Master Plan from the perspective of local residents concerning potential restricted access and the potential impact on neighboring communities and beaches. The draft version of the master plan has been revised to reflect feedback received from the community and includes significant changes. The revised master plan proposes the 900-person visitor limit as an initial number which can be adaptively managed and adjusted as appropriate, especially if there continues to be unwanted impacts at the park and the surrounding community. If there continue to be issues, State Parks will work with the advisory committee on adjusting the number and will also be conscious of unintended impacts on neighboring beaches like your concern regarding damage to Makua Bay.

The proposed visitor limits will also be instituted only during peak hours of park use and will allow visitors to enter before and after without being counted against the visitor limit. Therefore, access will be allowed into the park outside those peak hours and will be adjusted as appropriate based on ongoing input from the community. There will also be exemptions from the visitor limit total for special user groups. Please see the attached Section 2.5.4.3 from the Final EIS on the revised visitor limits proposed.

In response to your comments regarding parking enforcement and shuttle service, the parking improvements are intended to address parking enforcement with a parking fee structure for entry and facilities designed to support the recommended shuttle service. While the potential shuttle service is not proposed to be administered by State Parks in the revised master plan, it does include specific elements to support effective implementation with infrastructure design for the proposed park entry and main parking lot to support a recommended shuttle service with shuttle stop structures, as described in Section 2.5.1.1 and Section 2.5.1.2 from the Final EIS.

We also acknowledge your suggestion for informing visitors about the environmentally sensitive areas of the park. The revised plan includes proposals to provide information to all visitors prior to entry with availability at the Welcome Hale and online. The attached sections from the Final EIS on Visitor Orientation and Welcome Hale described the proposed provisions for information, which will educate visitors to the park on appropriate behavior for preserving the natural and cultural resources within the park.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oeq2.doh.hawaii.gov/EA\\_EIS\\_Library/2018-10-KA-FEIS-Haena-State-Park-Master-Plan.pdf](http://oeq2.doh.hawaii.gov/EA_EIS_Library/2018-10-KA-FEIS-Haena-State-Park-Master-Plan.pdf) on 10/18/2018.

Aloha,

Kimi Mikami Yuen, LEED AP BD+C  
Principal

**Subject:** Haena State Park EIS

Aloha,

I attended the meeting at the Hanalei School in August and would like to submit the following comments on behalf of Jack Harter Helicopters. We are a helicopter charter company that has been hired by contractors working on NaPali. We transport people, equipment and rubbish to and from the current helicopter landing area within the park. We often transport loads slung under our helicopters (external load operations). It is critical in this support role that we have a location within the Park to operate from that is safe and large enough to accommodate our operations. The current helicopter landing zone is acceptable, but could be improved to increase safety. The proposal has a possible helicopter landing area located right next to the visitor parking area. This is not an ideal location for the landing area because of the proximity to automobiles and people.

We would like to see an area designated for helicopter landings that is somewhat separated from the park users, park staff and their associated vehicles. An ideal area also needs to have ingress and egress paths that will allow us to fly from the ocean to the landing area without flying over persons or vehicles. There is also a need for parking for the trail workers.

I am available to discuss this matter and would be interested in discussing this with your planners when they have time to do so.

Casey Riemer

**SUBJECT: COMMENTS ON THE HÅ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HÅ'ENA, KAUA'I, HAWAII**

Aloha Mr. Riemer,

Mahalo nui for your emailed comments dated September 9, 2015 regarding the Hå'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the long delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Community Advisory Committee to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the Community Advisory Committee. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your concerns with the location of the alternative helipad location in the proposed master plan due to the proximity of the new main parking lot. We appreciate your recommendations to provide a large area with adequate distance from automobiles and park visitors for safety concerns and well as flight paths away from visitor uses. The final location and details have not been determined and are subject to a forthcoming detailed design process for the main parking lot and park entry, where we will incorporate your input. However, the number of facilities near the parking lot has been reduced in the revised master plan so there may be more areas available for safe landing zones. Please see Figure 1 which shows the updated master plan graphic from the Final EIS.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oeqc2.doh.hawaii.gov/EA\\_EIS\\_Library/2018\\_KA-FEIS-Haena-State-Park-Master-Plan.pdf](http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2018_KA-FEIS-Haena-State-Park-Master-Plan.pdf) on 9/20/2018.

Aloha,

JS 1.docx

SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUA'I, HAWAII

Aloha Ms. Lynch,

Mahalo nui for your comment card dated September 8, 2015 from the community meeting held on August 19, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your comment regarding limiting access to residents as a part of the master plan. The revised master plan calls for an adaptive management approach for both the parking and the proposed visitor limits, which will be adjusted based on an average number of visitors rather than a set limit per day. The limits will also be instituted only during peak hours of park use and will allow visitors to enter before and after peak hours without being counted against the visitor limit. There will be exemptions for special user groups, such as hunters and cultural practitioners. Entry fees for state parks are established by Hawai'i Administrative Rules (HAR) 13-146-6, which states that Hawai'i residents are exempt from paying park entry fees if they can show a valid Hawai'i ID. Other categories of fee exempt park users (such as registered volunteers) may be established at a later time. Please see the "Visitor Limits" attachment from Section 2.5.4.3 of the Final EIS, which shows the verbatim changes from the Draft EIS for this section:

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at: [http://oeq2.doh.hawaii.gov/EA\\_EIS\\_Library/2018--KA-FEIS-Haena-State-Park-Master-Plan.pdf](http://oeq2.doh.hawaii.gov/EA_EIS_Library/2018--KA-FEIS-Haena-State-Park-Master-Plan.pdf) on , 2018.

Aloha,

Kimi Mikami Yuen, LEED AP BD+C  
Principal

**Date:** 09/12/2015 05:37 PM  
**Subject:** proposed changes to Haena state park

I've lived on Kauai for 9 years, 5 of them on the North Shore and I've visited Haena state park countless times.  
I'm concerned about the proposed changes

- please do not limit the number of visitors; the problem is too many cars not too many people. Turning cars away at the gate will just mean more people trying to park at Haena beach park or at tunnels and they are already overcrowded with cars.
- I don't mind paying a fee to enter. There should be an option for Hawaii residents to buy an annual pass so we don't have to pay every time we go.
- The only real solution to the parking and traffic problems on the North Shore is a shuttle that runs 365 days a year and is subsidized by the county or state government. Perhaps the fees collected at the entrance to the park could be used to subsidize the shuttle
- Haena state park could more easily accommodate more people if there were more paths leading to other parts of the park. Right now everyone goes to the lagoon so it feels crowded, but if there were other places to go, the crowd would be spread out.

Mahalo  
Boreas van Nouthuys,

Month XX, 2018 - DRAFT

Mr. Boreas van Nouthuys  
2691 Onu Place  
Kalaheo, HI 96741

**SUBJECT: COMMENTS ON THE HA'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HA'ENA, KAUAI, HAWAII**

Aloha Mr. van Nouthuys,

Mahalo nui for your emailed comment dated September 12, 2015 regarding the Ha'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Ha'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your concerns with the Ha'ena State Park Master Plan Draft EIS and there have been several changes to reflect feedback received from the community. We acknowledge your comments requesting not to limit the number of visitors as well as your comment that the main issue is parking and your concern with the potential impact on neighboring communities and beaches.

The revised master plan proposes the 900-person visitor limit as an initial number which can be adaptively managed and adjusted as appropriate, especially if there continues to be unwanted impacts at the park and surrounding community. If there continue to be issues, State Parks will work with the advisory committee on adjusting the number and will also be conscious of unintended impacts on neighboring beaches like your stated concern regarding Ha'ena Beach Park and Tunnels. The proposed visitor limits will also be instituted only during peak hours of park use and will allow visitors to enter before and after without being counted against the visitor limit. Therefore, access will be allowed into the park outside those peak hours and will be adjusted as appropriate based on ongoing input from the community. There will also be exemptions from the visitor limit for permitted special user groups. Please see the attached **Section 2.5.4.3** from the Final EIS on the revised visitor limit proposal.

We also acknowledge your suggestions for parking fees with annual passes for Hawai'i residents. While there is no distinction between residents and nonresidents in the visitor limits, the revised plan features a similar park entry fee structure with the main parking lot separated into a fee-paying lot and non-fee-paying lot. As the State has more time to analyze user patterns, other options can be explored over time, and they are actively engaged in discussions regarding parking enforcement and increased fines along the roadway outside of the park as well. Currently, entry fees for all state parks are established by Hawai'i Administrative Rules (HAR) 13-146-6, at the rate of \$5/car or \$1/person. HAR 13-146-6 also states that Hawai'i residents are exempt from paying park entry fees if they

can show a valid Hawai'i ID. Similar fees could be instituted at Hä'ena State Park. However, State Parks will continue to work on the different options with the advisory committee. More information on the proposed fee structure for parking is attached in [Section 2.5.1.2](#) from the Final EIS.

In response to your suggestions for year-round shuttle service subsidized by county or state government and use of entry fees to fund subsidies, the revised master plan includes facilities designed to support the recommended shuttle service. While the potential shuttle service is not proposed to be administered by State Parks in the revised master plan, it does include specific elements to support effective implementation with infrastructure design for the proposed park entry and main parking lot to support a recommended shuttle service with shuttle stop structures, as described in [Section 2.5.1.1](#) and [Section 2.5.1.2](#) from the Final EIS.

We also recognize your suggestion for offering more paths throughout the park to mitigate crowding at the lagoon. However, due to the sensitivity of various cultural and natural areas within the park, the design of the pedestrian access does not allow multiple pathways to the beach. There have also been some revisions to pedestrian path in the revised master plan, however, it still maintains design to protect the archaeological sites. Please see the attached [Section 2.5.1.4](#) and [Figure 1](#) from the Final EIS detailing the new pedestrian path as well as the culturally and environmentally sensitive areas of the park.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at <http://oeqc2.doh.hawaii.gov/EA-EIS-Library/2018--KA-FEIS-Haena-State-Park-Master-Plan.pdf> on [Month XX, 2018](#).

Aloha,

Kimi Mikami Yuen, LEED AP BD+C

**Subject:** Re: Draft Master Plan for HÄ'ENA STATE PARK, Kauai

Yes, of course. PO Box 662034, Lihue, HI 96766.

My main objection to the proposal that I'm not sure I said clearly in my first email is this: Disturbing the land in order to construct buildings, new roads, parking lots and boardwalks. I think the park should be left in as wild a state as possible.  
Mahalo.

**Subject:** Draft Master Plan for HÄ'ENA STATE PARK, Kauai

I have two big funding concerns regarding this proposal. I question where the funding is going to come from to provide round the clock oversight of the park. This would likely require hiring six full time staff members to accomplish this. Along these same lines, a shuttle was already tried and funding was dropped. Now it is proposed to limit parking (brilliant) to 100 stalls (or fewer!) depending on how functional a shuttle turns out to work.

I don't feel the answer to easing traffic congestion should be to limit access. The parks I enjoy the most are the ones that have the least interference by parks & recreation/government. These proposals seek to interfere a great deal with the park from construction of new roads, parking lots, boardwalks, visitor center, caretakers' cottage, and construction of a limited access point of entry, etc. All this construction will be unsightly at a spot that is currently very picturesque. Hä'ena State Park offers a refuge to people from all over the world. People come thousands of miles to commune with nature and find healing on the trek to Kalalau Valley. This proposal seeks to limit that access, thereby limiting the enjoyment of the park.

Regarding the educational component of the proposal, if I want to be educated, I go to a museum. When I go to

Haena State Park, I go there to enjoy nature. I question how many people will come in out of the water or off the trail to sit still for an educational video or lecture. I feel that is something better accomplished in conjunction with a school field trip.

I think things should be left as they are. I certainly don't see anything in this proposal that I like. This is sounding a lot like measures taken at Yosemite National Park.

Month XX, 2018 - DRAFT

Ms. Christie Bagley  
P.O. Box 662034  
Lihue, HI 96766

**SUBJECT: COMMENTS ON THE HA'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HA'ENA, KAUAI, HAWAII**

Aloha Ms. Bagley,

Mahalo nui for your emailed comments dated September 10 and September 12, 2015 regarding the Ha'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Ha'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your concerns regarding funding aspects of the master plan. The Master Plan itself is an effort by State Parks to improve funding of coastal recreational planning and management. Completion of the plan and Chapter 343, HRS processing will enable State Parks to move forward with capital improvement projects to improve coastal recreation at the park. The Master Plan proposes to potentially increase the number of people staffed at the park, many feel that the current level of staffing is inadequate to effectively protect and maintain the resources and therefore an increase is warranted. State Parks is considering options to have a third-party operator manage the park who as part of their responsibilities would be to operate the park in a fiscally responsible way and independent of State funding as much as possible.

We also recognize your concerns regarding overdevelopment and construction at the park. The updated draft Master Plan for Ha'ena State Park includes management and development strategies that bring the significant historic, cultural and ecological resources of the park to the forefront and balance the protection of those resources with recreational and community uses. Only a few new structures are proposed, including a Welcome Hale that is envisioned as an open traditional Hawaiian hale and located near the improved main parking lot. Please see the revised Figure 1 Master Plan graphic and the "Master Plan Summary" attachment from Section 1.9.1 of the Final EIS, which show the verbatim changes from the Draft EIS in this section.

We recognize your concerns regarding congestion and limiting access to the park. The revised master plan calls for an adaptive management approach for both the parking and the proposed visitor limits, which will be adjusted based on an average number of visitors rather than a set limit per day. The limits will also be instituted only during peak hours of park use and will allow visitors to enter before and after peak hours without being counted against the visitor limit. Please see the "Visitor Limits" attachment from Section 2.5.4.3 of the Final EIS which shows the verbatim changes from the Draft EIS for this section.

We recognize your concerns regarding education at the park. Providing educational information and signage at the park will help to minimize impacts to the park's varied natural, cultural, historic, and scenic resources as visitors will learn about appropriate behavior, protocol, and activities permitted in the park, having the beneficial secondary effect of better protection of those resources and reduced user conflicts which will in turn improve mutual understanding, respect, and the feeling of aloha shared by all who visit the park. Please see the "Visitor Orientation" attachment from Section 2.5.4.5 of the Final EIS, which shows the verbatim changes from the Draft EIS for this section:

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. **Subject:** Ha'ena Park Plan

I live in Hanalei and support this plan. However, I also believe that something like a park and ride shuttle from Princeville to Ha'ena would be very beneficial, in addition to everything else in the plan. It isn't so much the people as the cars that hurt the part. If there were a good stiff charge for non-resident cars, but the shuttle was free or cheap, this would encourage people to do the shuttle. Perhaps the shuttle could be supported off the revenue from the car parking fees, so the county wouldn't have to pay cash for the shuttle. Perhaps a private company could offer this service with some subsidy from the county. Also, somehow we need to get the word out to tourists that the parking is horrible. Get there early or there will be no parking- so use the shuttle- it isn't much fun to get there and find it packed so you have to walk a mile or can't park at all. Thanks for looking at this- you are doing a good job and I am just trying to add an idea or two.

**SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUA'I, HAWAII**

Aloha Mr. Sutton,

Mahalo nui for your emailed comment dated September 14, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

Mahalo for your support of the master plan and recognize your comments suggesting "park and ride" shuttle service from Princeville. While the potential shuttle service in the revised master plan is not proposed to be administered by State Parks, it does include specific elements to support effective implementation with infrastructure design for the proposed park entry and main parking lot to support a recommended shuttle service with shuttle stop structures, as described in **Section 2.5.1.1** and **Section 2.5.1.2** from the Final EIS.

We also acknowledge your suggestion for non-resident parking fees to generate revenue and incentivize shuttle use. The proposed parking improvements include an entry fee structure similar to your suggested parking fees. Entry fees for state parks are established by Hawai'i Administrative Rules (HAR) 13-146-6, at the rate of \$5/car or \$1/person. HAR 13-146-6 also states that Hawai'i residents are exempt from paying park entry fees if they can show a valid Hawai'i ID. Similar fees could be instituted at Hā'ena State Park and State Parks will continue to work on the different options with the advisory committee. Other categories of fee exempt park users (such as registered volunteers) may be established at a later time. A description of parking improvements proposed is attached in **Section 2.5.1.2** from the Final EIS.

We also acknowledge your suggestion to encourage the county to subsidize a private shuttle service and distribute information to tourists on the parking restrictions at the park. The revised plan also includes proposals to provide information and notices to all visitors prior to entry with availability at the Welcome Hale and online. In addition to general information on parking condition, public information will also educate visitors to the park on appropriate behavior for preserving the natural and cultural resources within the park. The attached sections from the Final EIS on **Visitor Orientation** and **Welcome Hale** described the proposed provisions for information.

**To:** Lauren.A.Tanaka@hawaii.gov; Kimi Yuen  
**Subject:** Haena State Park comment 9.15.15

Hi Lauren

I'm a full time resident in Haena and I like that the traffic and mess at the end of the road is being addressed. I have one major concern and two comments.

1) Locals residents of Haena/Wainiha should not be counted in the 900. I and other residents walk, jog and bike to Kee regularly and we need assurance that we can continue to do so. We pay the local taxes and live here to enjoy this stretch of coast and want unobstructed walking, biking and jogging to the end of the road.  
What is the current plan for residents?

Comments:

- 2) Limahuli Gardens is a great model of interpretive experiences without ridiculous buildings and other structures.  
3) Denali National Park is a successful model of a shuttle system that accentuates nature and limits human impact.

Please let me know how local residents will be able to freely walk, run, and bike the road to Kee.

Thanks

Matt Hunter

**SUBJECT: COMMENTS ON THE HÄ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HÄ'ENA, KAUA'I, HAWAII**

Aloha Mr. Hunter,

Mahalo nui for your emailed comment dated September 15, 2015 regarding the Hä'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hä'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

Mahalo for your support of the aspects of the master plan to address traffic congestion. We recognize your concerns with local resident access and the specific impact on residents choosing to walk, jog, and/or bike to Ke'e. The revised master plan proposes the 900-person visitor limit as an initial number which can be adaptively managed and adjusted as appropriate, especially if there continues to be unwanted impacts at the park and surrounding community. If there continue to be issues, State Parks will work with the advisory committee on adjusting the number.

There will also be exemptions from the visitor limit total for special user groups from the community, such as cultural practitioners. In addition, the proposed visitor limits will be adjusted based on an average number of visitors rather than a set limit per day. The limits will also be instituted only during peak hours of park use and will allow visitors to enter before and after without being counted against the visitor limit. Please reference the attached **Section 2.5.4.3** on the proposed visitor limits from the Final EIS for more details.

We also acknowledge your comments on Limahuli Gardens and Denali National Park as models for interpretive experiences with minimal building structures. The draft version of the Master Plan has been revised to reflect feedback received from the community and the revised master plan includes significant changes and minimal physical improvements to preserve the natural beauty of the park. Most of the proposed buildings, including the visitor center and caretaker's cottage, have been removed in the revised master plan. The master plan includes many aspects to restore the natural environment of the park. Please see the **Master Plan Summary** from the Final EIS attached for reference with an overview of the revisions to the plan.

I like the plan. I was concerned about the raised boardwalk being to conspicuous, but realize it is not. My only question is, should we restrict to less than 900 visitors since there will be hunters and kamaiana over that number?

Haena State Park - DS.docx

SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUA'I, HAWAII

Aloha Ms. Rogers,

Mahalo nui for your emailed comment dated September 18, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

Mahalo for your support of the Hā'ena State Park Master Plan. However, we recognize your concerns with the originally proposed "raised boardwalk" you referenced in your comments. The boardwalk has been modified in the revised master plan. The new pedestrian pathway follows along the first berm of the lo'i closest to the highway and is proposed to be slightly elevated so as not to impact the berm or any of the historic resources. Please see the attached Section 2.5.1.4 from the Final EIS detailing the modified pedestrian path.

We also recognize your comments concerning access for hunters and kama'āina with the proposed visitor limits. The revised master plan proposes the 900-person visitor limit as an initial number which can be adaptively managed and adjusted as appropriate, especially if there continues to be unwanted impacts at the park and surrounding community. If there continue to be issues, State Parks will work with the advisory committee on adjusting the number. There will also be exemptions from the visitor limit total for permitted hunters, overnight camping hikers and/or other special user groups. The proposed visitor limits will be adjusted based on an average number of visitors rather than a set limit per day. The limits will also be instituted only during peak hours of park use and will allow visitors to enter before and after without being counted against the visitor limit. Please reference the attached Section 2.5.4.3 on the proposed visitor limits from the Final EIS for more details.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oeeq2.doh.hawaii.gov/EA\\_HIS\\_Library/2018--KA-Haena-State-Park-Master-Plan.pdf](http://oeeq2.doh.hawaii.gov/EA_HIS_Library/2018--KA-Haena-State-Park-Master-Plan.pdf) on 2018.

**Subject:** Ke'e Beach Park

Lauren Tanaka  
Division of State Parks of Hawaii  
1151 Punchbowl St., Room 310  
Honolulu, HI 96813

I am writing to you concerning the proposed restriction of driving and parking on Ke'e Beach. My home is on Kuhio Highway in Haena, west of Wainiha Stream. My home was built more than 40 years ago, long before this State Park was created. Because all the homeowners (just west of Wainiha Stream to Ke'e Park Beach) up to now needs to use most safety and enjoyment on Ke'e Beach. Other nearby beeches has less safety and is more difficult to reach the ocean.

The big crowds of cars on Ke'e Beach Park are from:

- (1) Huge cruise ships with 2000 or more passengers stopping for one day at Nawiliwili. The majority of those passengers will rent cars and rush to Ke'e Beach.
- (2) Largest of tourists stay in hotels and condos in Poipu who drive almost 2 hours through Kapaa to reach Ke'e Beach.

**For the above (1) an (2) are massively traffic and parking when most get there arriving at 10 AM and leaving at 4 PM in order to catch their ship or get where they are staying to eat.**

- (3) A large number of hikers leave there cars for all day or much longer to hike on Kalalau Trail. They should walk to a new special parking area to walk just a few feet longer away from the beach access. Since they already are walking, a little longer will not be too difficult. They will already be taking a long walk.

**Requiring many people hiking, in a cruise ship or driving a long distant be required to take a good bus to Ke'e Beach.** The prior attempt was a junk yard bus. It would save a lot of State money and have a better Beach Park.

If you still intend to provide restrictions for the end of Kuhio Highway, please provide special permits for homeowners Haena west of Wainiha stream

Sincerely,

Jim

Month XX, 2018 - DRAFT

**SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUA'I, HAWAII**

Aloha Mr. Christiansen,

Mahalo nui for your emailed comment dated September 20, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your concerns numbered (1) and (2) regarding traffic and parking in regards to the Hā'ena State Park Master Plan, including visitor demands from cruise ships, tourists, rental cars, and peak park usage periods based on these factors. The revised master plan proposes the 900-person visitor limit as an initial number which can be adaptively managed and adjusted as appropriate, especially if there continues to be unwanted impacts at the park. If there continue to be issues, State Parks will work with the advisory committees on adjusting the number. As the State has more time to analyze user patterns, other options can be explored over time, and they are actively engaged in discussions regarding parking enforcement and increased fines along the roadway outside of the park as well. Visitor limits will be instituted during peak hours of park use. **Please see the "Visitor Limits" attachment from Section 2.5.4.3 of the Final EIS which shows the verbatim changes from the Draft EIS for this section**

We recognize your comment numbered (3), regarding designated parking for the parking lot closer to the beach. Per the revised master plan, parking will be simplified and better organized by limiting it to two lots: the main one at the entrance and the special access parking lot at Kē'ē. Hikers will be directed to use the main parking lot, as the special access parking lot at Kē'ē will be reserved for ADA accessibility, the lifeguards, park staff, the Hula Complex, and other cultural practices. It will also be accessible for emergencies as well as safety and rescue operations. **Please see the "Parking" attachment from Section 2.5.1.2 of the Final EIS which shows the verbatim changes from the Draft EIS for this section.**

We also recognize your comment regarding the quality of the bus/shuttle for the master plan. The type of bus will be determined by the third-party shuttle operator. A proposed third-party shuttle service has been analyzed as a part of the project's traffic impact assessment report, included in the EIS as Appendix F. The preferred scenario is to implement a third-party shuttle from the Princeville facility at the start of Phase I, minimizing the need for visitor parking in the parking lot in the park. Please see the "Shuttle Service" attachment from Section 4.3.3 of the Final EIS, which shows the verbatim changes from the Draft EIS for this section.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oeqc2.doh.hawaii.gov/EA\\_EIS\\_Library/2018-\\_-KA-FEIS-Haena-State-Park-Master-Plan.pdf](http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2018-_-KA-FEIS-Haena-State-Park-Master-Plan.pdf) on 9/23/2018.

Aloha,

Kimi Mikami Yuen, LEED AP BD+C

**Re: Draft EIS for Ha'ena State Park Master Plan**

I am a resident of Wainiha and have lived in Wainiha for 25 years. I have a master's degree in environmental planning through the geography department at H Manoa and did what I believe was the first census of hikers at Ke'e in 1984 as part of the field study for my thesis.

I have not had time to read through all 1000+ pages of the Draft EIS for the Ha'ena State Park Master Plan, but wanted to submit my comments based on reading the first 88 pages.

- I am not clear what hours the park will be open and how the park will be secured when it is closed, since it would seem impossible to fence it off across the beach and reef. How would visitors be prevented from walking down the beach from Ha'ena County Park?
- I know I am one of many local residents who, over the years, have adapted to growing crowds at Ke'e by biking to the end of the road before 8 am to walk the beach, swim in the lagoon and dip at Cold Pond on the way home. I hope there would be a way of accommodating such use in the final master plan.
- I think it is optimistic to think that the visitors turned away will simply disperse elsewhere. One only needs to drive to the end of the road during the summer to see how people park along the road and fill the parking at Ha'ena County Park. In my experience, people are like water and will find a way to get where they want to go despite your best efforts to contain them. I think it is essential to work with the Hawaii Tourism Authority to try to align advertising for Kauai with a number of visitors that we can offer a quality experience to. If the State proposes to reduce the number of visitors allowed in the park by more than 5%, then it is counter productive to spend money advertising to increase visitors coming to Kaua'i. It seems to me that travel guides have a major influence in where visitors go. It would be ideal to have a liaison person who can work with publishers to help achieve the goals of this master plan.

Sincerely,

Kathy Valier

**SUBJECT: COMMENTS ON THE HA'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HA'ENA, KAUAI, HAWAII**

Aloha Ms. Valier,

Mahalo nui for your emailed comment dated September 23, 2015 regarding the Ha'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Ha'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We acknowledge your comments concerning park hours and regulation of the proposed visitor limits, including access for local residents. As you noted, the revised master plan does not include a fully fenced off design for the park. In addition, the proposed visitor limits will be adjusted based on an average number of visitors rather than a set limit per day. The limits will also be instituted only during peak hours of park use and will allow visitors to enter before and after without being counted against the visitor limit. Therefore, access will be allowed into the park and parking lot outside of those peak hours and will be adjusted as appropriate based on ongoing input from the community. The new main gate will be the only point of entry for managing the proposed visitor limits and there are no proposals in the revised master plan for constructing fencing around the entire park. In addition, the proposed gate design will allow pedestrian and bicycle access even when it is closed to vehicles. More details can be found on the design of the park entry in the attached **Section 2.5.1.1** from the Final EIS

We also recognize your concerns with the potential impact on neighboring communities and beaches. The revised master plan proposes the 900-person visitor limit as an initial number which can be adaptively managed and adjusted as appropriate, especially if there continues to be unwanted impacts at the park and the surrounding community. If there continue to be issues, State Parks will work with the advisory committee on adjusting the number and will also be conscious of unintended impacts on neighboring beaches. Please reference the attached **Section 2.5.4.3** from the Final EIS for more details on park entry and the proposed visitor limits.

We acknowledge your concern with overall tourism volume and your suggestions to work with the tourism agencies to manage marketing efforts that may impact visitor numbers at the park, however, the suggestions are beyond the scope of the Final EIS. The revised plan also includes proposals to provide information on the park to all visitors prior to entry with

**From:** sailor decamp <sailordcamp@hotmail.com>  
**Sent:** Thursday, September 24, 2015 2:47 PM  
**To:** Kimi Yuen  
**Subject:** Ke'e Beach, Haena, HI

Hi, I've lived in Haena close to 40 yrs. I've enjoyed KEE beach since it was pristine and quiet and no one ever went there. Now with the traffic it's chaotic so no one would be to fix that,  
(1). It's not going to stop because too many developers and everyone making money off tourists are promoting the area. The main traffic problems as everyone knows are: The car rental companies. They are probably behind every stoppage of every traffic solution that comes up. And they've been growing and growing and it gets worse and worse. I'm sure they have all the needed majority of mayors and county councilmen in their pockets. Because of the very limited parking space from Hanalei to the end of the road; The easiest and best thing for the North shore is for limited size unobtrusive fuel efficient private passenger van companies to be the only vehicles allowed down the hill from Princeville. Princeville Development is the reason for all the traffic in the first place. There used to be no traffic problems. As Princeville grew traffic grew. They recruit plenty (maybe hundreds) of minimum pay workers from the mainland also adding to the problem. They have been totally irresponsible of the impact they cause. They should have to pay and run the shuttle service themselves in reality. They have plenty of property that a long time ago should have been made into parking for the cars taking the shuttle service. It would mostly be for cars other than Princeville as a courtesy I'm sure of the hotels and condos would have their own beach shuttles. The people that live past Princeville or are staying in hotel or property there are the only ones with a permit sticker on their car allowed down the hill. It's not that hard to work out. I've lived in beach communities where this is what they had to do. The shuttle companies would get efficient real quick to however the need came up and they would profit from it. Uber would probably be big with Hanalei residents who had permits (private vehicles only so they didn't try sneaking in a bunch of cars to use for rentals from Hanalei). I've seen vans like these with more efficient service in St. Lucia and even third world countries, it's stupid it's been going on this long. Hertz rental would probably one with the first shuttles, haha!

(2) The natural beauty of Kee, it's gorgeous because it's surrounded by jungle and natural vegetation and some taro gardens by some Hawaiian families that have been there probably over 100 yrs, leave them alone, they have already had the land there stolen from them by the Wickmans and the Moore family, the Moore family by a sneaky land claim when it became a state not that long ago. The Wickmans I think we're part of the Hawaiian overthrow. Now Chipper Wickman wants to make the whole area part of his Limahuli Botanical Garden. They have plans for the Museum, etc, like Kokee. This will ruin the unique natural integrity it has. So I say forget it!

To change it to a park museum where I'm sure they would all make a nice profit is to ruin it in another way. Let it stay with the beautiful feel it had once the cars are out of there. I used to be able to ride my bike around and all the way to the end. With the traffic going out there it's too dangerous to ride on the road now.

(3) let the Hawaiians plant their taro and food their. It's authentic and lovely. They should have that right!

(4) There are some Hawaiians that want the area past the beach blocked off to everyone but their hula halau. I say this is not fair and greedy off them. All the years I've lived there, it's been a special almost meditative walk to go around and up in that area. It's pretty and very special. The halau use it which is special also but they don't use it every day, every week, or even every month. The Hawaiians put halau on every pretty spot on the island. Why should they try to hog it only for themselves. I've only seen the tourists be very respectful and

appreciative. It's like my backyard too, they already ruined Makawao Caveby Shipwrecks beach that was the natural Secret Garden spot that I loved. It had a few supposedlu ancient Hawaiian petroglyphs and a little cave entrance into a big natural ring that a big tree grew in the center of, it was shady in a really hot drier side of the island and nice and quiet. Then some cultural idiots laid claim to it, put in an iron gate and locked everyone out, tore out the tree, and brought in water hoses and grew a lawn. Then they put in a little stage on one side and grew a Palm tree on each side. Then they put in big stage lighting with big electric cords crisscrossing the ground. I almost fell over the cliff trying to see inside at what they had done to it. It was ruined. For what? To make a stage you could fabricate like that anywhere? Who enjoys it now? I never see anything that says their is a show there to see?! Leave it with the State parks so they can leave it more to the people. The Fed overreaches a lot of the time and will close it down on any premise it comes up with. It's happened with lots of Federal parks for political reasons.

Aloha Nui,

Hanalei, HI 96714

**SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUAI, HAWAII**

Aloha Ms. DeCamp,

Mahalo nui for your emailed comment dated September 24, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

1. We recognize your concerns regarding traffic and parking issues at the park, including a potential third-party shuttle service. The proposed third-party shuttle service has been analyzed as a part of the project's traffic impact assessment report, included in the EIS as Appendix F. The preferred scenario is to implement a third-party shuttle from the Princeville facility at the start of Phase I, minimizing the need for visitor parking in the parking lot in the park. **Please see the "Shuttle Service" attachment from Section 4.3.3 of the Final EIS, which shows the verbatim changes from the Draft EIS for this section.**

As a part of the master plan, the main parking lot is proposed to be separated into a fee-paying lot and non-fee-paying lot, which will also be adjusted daily to allow flexibility depending on future demand for parking and the potential use of the proposed shuttle. The revised master plan proposes the 900-person visitor limit as an initial number which can be adaptively managed and adjusted as appropriate, especially if there continues to be unwanted impacts at the park. If there continue to be issues, State Parks will work with the advisory committees on adjusting the number. As the State has more time to analyze user patterns, other options can be explored over time, and they are actively engaged in discussions regarding parking enforcement and increased fines along the roadway outside of the park as well. **Please see the "Parking and Visitor Limits" attachments from the Final EIS, which show the verbatim changes from the Draft EIS for these sections.**

2. We also recognize your comments identifying the beauty of Hā'ena's natural environment. Main reasons for proceeding with the proposed Master Plan include protection and restoration of the park's sensitive and unique natural, cultural, historic, and scenic resources; improvement of the environmental conditions such as surface and marine water quality; removal of alien species and restoration of native ecosystems; and reducing negative impacts to native flora and fauna.

printed on recycled paper

3. The park contains extensive historical, archaeological and cultural features, such as the Ka Ulu a Paoa Heiau, Ke Ahu a Laka, Lohi'au's house platform, known burials and cemeteries, a historic house site, wet caves, restored taro lo'i, as well as unrestored Agricultural Complex walls and 'auwai. On-going cultural practices, including maintenance and restoration of lo'i and Agricultural Complex areas are highlighted in the EIS and are identified as essential components of the Master Plan.
4. The updated draft Master Plan for Hā'ena State Park includes management and development strategies that bring the significant historic, cultural and ecological resources of the park to the forefront and balance the protection of those resources with recreational and community uses. The master plan's vision includes recreational uses co-existing with cultural practices and educational programs in order to provide opportunities for the diverse types of community park users. Given the extreme importance of the area around the ancient heiau and its worldwide recognition as a wahi kapu, the entire area makai of the Kalalau Trailhead and encompassing the area of the former Allerton estate and the heiau is designated as a Hula Complex. It is the first priority of the Master Plan Advisory Committee to restore the area and to develop a culturally appropriate management plan. While the master plan EIS complies with federal regulations and guidelines, the park is under the jurisdiction of the State of Hawai'i, under the Department of Land and Natural Resources, Division of State Parks. Please see the revised Figure 1 Master Plan graphic and the "Master Plan Summary" attachment from Section 1.9.1 of the Final EIS, which show the verbatim changes from the Draft EIS in this section.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. **Subject:** ha'ena state park.easy solution

aloha lauren:

seems to me one of the reasons the end of the road is so crowded is because everyone is funneled thru the one narrow entrance to the beach by the lifeguard stand. Why not open up several pathways to the expanse of the beach so access to the other parts of the beach are more easily accessible. Also, there is plenty of room to double and triple the size of the existing dirt parking lot...create a path for them to walk to the beach directly behind the existing lot...make a wide turn around and basically all your problems are solved. (you may need another lifeguard stand to cover this newly exposed part of the beach)...please dont make it more complicated than it needs to be.

Mahalo for your kind consideration.  
Gary Bart

Hanalei, HI 96714

**SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUA'I, HAWAII**

Aloha Mr. Bart,

Mahalo nui for your emailed comment dated October 2, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your concerns regarding overcrowding, parking and entry/access design to the beach. We acknowledge your suggestions on increasing the number of pathways through the park to mitigate the crowded "funneled" entrance. However, due to the sensitivity of various cultural and natural areas within the park, the design of the pedestrian access does not allow multiple pathways to the beach. The boardwalk has been modified in the revised master plan. The new pedestrian pathway follows along the first berm of the lo'i closest to the highway and is proposed to be slightly elevated so as not to impact the berm or any of the historic resources. Please see the attached **Section 2.5.1.4 and Figure 1** from the Final EIS detailing the modified pedestrian path as well as the culturally and environmentally sensitive areas of the park.

Mahalo for your suggestions on creating a wide turnaround and modifying the existing dirt parking lot. The parking lot and park entry improvements in the revised master plan includes a turnaround to mitigate congestion near the parking lot similar to your suggestions. The parking area will be designed to allow flexibility depending on future demand for parking and the potential use of the proposed shuttle. Please see the attached **Section 2.5.1.1 and Section 2.5.1.2** from the Final EIS for more details on parking and the park entry turnaround.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oeqc2.doh.hawaii.gov/EA\\_EIS\\_Library/2018-KA-FEIS-Haena-State-Park-Master-Plan.pdf](http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2018-KA-FEIS-Haena-State-Park-Master-Plan.pdf) on **Month XX, 2018**.

Please share your comments on the Hā'ena State Park Master Plan Draft EIS.  
(If you would like a written response letter, please include your mailing address.)

I think we should explore the specifics of the organization that could manage the park and the potential and probable amount of money that the organization could make. In addition, it would be useful to address how these moneys could or should be used. Also, is there a way of discriminating against rental cars? Perhaps one day a week can be reserved for preservation and closed to non-residents or if that is illegal, perhaps a hawaiian based or hawaiian race organization can have privileges. Also, I think the information about the issues of Kele should be given to visitors in a non aggressive way before they get there.

All visitors will be provided with park rules and information prior to entering the park. The orientation information could be made available on the State Parks website or tied to ticket purchase, particularly if advanced reservations become a requirement in the future. The orientation session would educate visitors on appropriate recreational activities and behavior, safety precautions as well as sensitivity to natural and cultural resources and to cultural activities that may be occurring in the park. This is described in Section 2.5.4.5 of the EIS and the verbatim description of these procedures is included in the "Visitor Orientation" attachment.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. P.O. Box 478  
Hanalei, HI 96714  
SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUA'I, HAWAII

Aloha,

Mahalo nui for your comment card dated August 24, 2015 from the community meeting held on August 19, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We recognize your comments regarding management and funding of the park. One of the key management recommendations is to establish a permanent Cultural Advisory Group and Community Advisory Committee. These are described in Section 2.5.4.2 of the EIS and the verbatim description of these groups is included in the "Cultural and Community Advisory Group" attachment.

We also recognize your comments regarding limiting parking at the park. The revised master plan calls for an adaptive management approach for both the parking and the proposed visitor limits, which will be adjusted based on an average number of visitors rather than a set limit per day. The main parking lot is proposed to be separated into a fee-paying lot and non-fee-paying lot, which will also be adjusted daily to allow flexibility depending on future demand for parking and the potential use of the proposed shuttle. Please see the "Parking" and "Visitor Limits" attachments from the Final EIS which show the verbatim changes from the Draft EIS for these sections.

We recognize your comments regarding cultural and historic preservation as a part of the park access and educational programs for visitors as a part of the park master plan. The daily visitor limit proposed in the adaptive management approach also would not include cultural practitioners or special user groups such as hālau, lo'i workgroups, cemetery caretakers, or school groups as all except the cemetery caretakers will require advanced reservations.

Please share your comments on the Hā'ena State Park Master Plan Draft EIS.

(If you would like a written response letter, please include your mailing address.)

Where will the "turn-around" point be? (where the 1st 900 visitors gain entry)? If it is at the entry to the Ke'e Rec. area, the rejected overflow may end up overcrowding/impacting the Tunnels/Makua beach area, stressing the already overcrowded Haena Beach park area and on the highway. Above and beyond the parking concerns, are the conservation considerations / is... a sloughing environmentally compromised coral reef area.

Capping the visitor count thru the HAW. Tourism Authority and the Kona Visitor Bureau should be considered, even at the risk of diminished tourism revenue — because w/ our suffering ecosystem + sorry infrastructure everyone, residents + visitors alike will be negatively impacted.

SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN DRAFT ENVIRONMENTAL  
IMPACT STATEMENT (EIS), HĀ'ENA, KAUA'I, HAWAII  
Month XX, 2018  
Page 2

We recognize your comment regarding proposed visitor limits to the park. The revised master plan proposes the 900-person visitor limit as an initial number which can be adaptively managed and adjusted as appropriate, especially if there continues to be unwanted impacts at the park. If there continue to be issues, State Parks will work with the advisory committees on adjusting the number. Please see the "Visitor Limits" attachment from Section 2.5.4.3 of the Final EIS, which shows the verbatim changes from the Draft EIS for this section.

We recognize your comments regarding cultural conservation and protection as a part of the park master plan. The master plan supports the continued restoration of the Agricultural Complex and encourages restoration of the varied historic, cultural, and natural resources throughout the park. It prioritizes the restoration of the dune complex as a potential first effort, recognizing the multiple benefits of ecological restoration, beach protection, and caring for the iwi kupuna.

One of the key management recommendations is to establish a permanent Cultural Advisory Group and Community Advisory Committee. These are described in Section 2.5.4.2 of the EIS and the verbatim description of these groups is included in the "Cultural and Community Advisory Group" attachment.

An objective of the Master Plan is to balance outdoor recreational uses with the protection and preservation of the park's natural and cultural features to enrich the Hā'ena park experience for all. Recreational aspects of the park will still be on going and are described in more detail in EIS Section 4.9.4. All visitors will be provided with park rules and information prior to entering the park. This is described in Section 2.5.4.5 of the EIS and the verbatim description of these procedures is included in the "Visitor Orientation" attachment.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. SUBJECT: COMMENTS ON THE HĀ'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HĀ'ENA, KAUA'I, HAWAII

Aloha,

Mahalo nui for your comment card dated August 26, 2015 from the community meeting held on August 19, 2015 regarding the Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawai'i, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Hā'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

We also recognize your comments regarding the main entry at the park. A new main gate is recommended to be installed when the highway is closed to general vehicle traffic to reduce visitor exposure to the rockfall hazards. Only those with special access to Kē'e, such as the lifeguards and rescue personnel, those with valid ADA parking placards on plates, park staff, the Hula Complex and other cultural practitioners will be allowed along the limited access portion of the highway. It will have a separate entry off the turnaround. Rockfall hazard warning signs will be installed on the gate across the highway and a swing gate on the mauka half of the right-of-way could be automated to open for exiting traffic only.

A vehicle turnaround is provided just past the park entry and provides separate accesses to and from the main parking lot, as well as the special access parking at Kē'e, and a separate staging area that could be used for various park purposes. Those who do not have valid park parking access may continue around the turnaround and exit the park without blocking traffic. Please see the "Park Entry" attachment from Section 2.5.1.1 of the Final EIS, which show the verbatim changes from the Draft EIS for this section.

Also located at the turnaround, shade structures are provided to support general visitor drop-off and pick-up areas or can be used as a shuttle or bus stop when such services become available. Shuttle and transit schedules should be posted at the stop if they are established. Should shuttle or transit service to the park become successful enough to eliminate or reduce the need for the parking lot, the shuttle stop area can be enlarged to accommodate the required passenger drop offs and pick-ups.

----- Forwarded by Lauren A Tanaka/DLNR/StateHUS on 08/18/2015 05:48 PM -----

**From:** mystiseseaswimmer@gmail.com  
**To:** Lauren.A.Tanaka@hawaii.gov,  
**Date:** 08/17/2015 09:33 AM  
**Subject:** Regarding the Ha'ena/Ke'e Park project.

Dear Lauren,

Regarding the Ha'ena/Ke'e Park project.

I am a 12 year resident of Kaua'i and a 1+ year resident of Ha'ena. What seems an easy (and relatively inexpensive) solution to the Ke'e over crowding with little construction, is to have a viable North Shore shuttle service operating at 15 minute intervals in Summer months, and possibly during winter. From my estimation now in the summer, it seems 90-95% of current cars parking at Ke'e are rental cars from North Shore staying visitors. Make it expensive to park, say \$20-30 for the day for visitors, and have a regularly arriving shuttle and it becomes a no-brainer for visitors to plan to hop on a shuttle. Parking mess solved.

I wonder why this hasn't been put forth already, except that it may be a county versus state jurisdiction thing of who funds/operates a shuttle, and who staffs/funds parking. When the County of Kauai did the shuttle last year it was operating only in the winter, and as no-surprise, had low ridership and was cancelled. Not smart, if the intention was for it to succeed. Also, with no parking fees at Ke'e then, there was no incentive for visitors to take a shuttle if they could be lazy and drive their rental car. Incentivize the shuttle and it will work, I believe.

Thank you,

Jenn Tyler  
Ha'ena

Month XX, 2018 - DRAFT

**SUBJECT: COMMENTS ON THE HA'ENA STATE PARK MASTER PLAN  
DRAFT ENVIRONMENTAL IMPACT STATEMENT (EIS),  
HA'ENA, KAUAI, HAWAII**

Aloha Ms. Tyler,

Mahalo nui for your emailed comment dated August 17, 2015 regarding the Ha'ena State Park Master Plan Draft Environmental Impact Statement (EIS). We sincerely apologize for the delay in responding. Due to the feedback received on the Draft EIS, the State of Hawaii's, Department of Land and Natural Resources, Division of State Parks (State Parks) has worked on revising the master plan with a reorganized Ha'ena State Park Community Advisory Committee (HSPCAC) to address the concerns voiced by the larger community. As a result, the master plan presented in the Final EIS has been updated based on the feedback received from the public meetings, comments received, and subsequent extensive collaboration with the HSPCAC. As the planning consultant for State Parks, we offer the following responses to your comments.

Mahalo for your suggestions to have a North Shore shuttle service. The master plan supports shuttle service to and from the park by including a shuttle stop at the turnaround as described in [Section 2.5.11](#) of the Final EIS. We recognize your concerns with existing overcrowding and the impact of tourists and rental cars on the park. Mahalo for your suggestions on charging high parking fees to incentivize a potential shuttle service.

Mahalo nui for your input and participation in the environmental review process. Your letter will be included in the Final EIS. If you would like a copy of the Final EIS or portions thereof, please let us know. Otherwise, the electronic copy of the Final EIS will be available on the Office of Environmental Quality Control website at [http://oeqc2.doh.hawaii.gov/EA\\_EIS\\_Library/2018\\_KA-FEIS-Haena-State-Park-Master-Plan.pdf](http://oeqc2.doh.hawaii.gov/EA_EIS_Library/2018_KA-FEIS-Haena-State-Park-Master-Plan.pdf) on [August 18, 2018](#).

Aloha,

Kimi Mikami Yuen, LEED AP BD+C  
Principal

# ENVIRONMENTAL REVIEW LAW

## 1.6 COMPLIANCE WITH STATE AND COUNTY OF KAUAI ENVIRONMENTAL LAWS

This document has been prepared in accordance with the provisions of the State of Hawai'i's Environmental Impact Statement Law, Chapter 343, HRS and the Environmental Impact Statement Rules, Title 11, Chapter 200, HAR. Section 343-5, HRS, establishes nine (9) actions, or "triggers," which require the environmental review process. Implementation of the Hā'ena State Park Master Plan will involve the following triggers: 1) the use of State land and funds, 2) the use of county lands or funds; 3) a use within a shoreline area; 4) a use within a Historic District as designated in the Hawai'i and National Registers of Historic Places; 5) the use of State lands classified as a Conservation District; and 6) the modification of existing helicopter facilities within the State that may affect lands within a Conservation District, shoreline area, and registered historic site.

In addition, the project may involve or impact State and/or County lands or funds relating to, connections to, and/or easements across, State or County facilities and lands including but not limited to infrastructure improvements for public roadways, water, sewer, utility, drainage, or other facilities. While the specific nature of each improvement is not known at this time, the EIS is intended to address all current and future instances involving the use of State and/or County lands or funds relating to the proposed park improvements.

The DEIS was preceded by the Hā'ena State Park Master Plan Environmental Impact Statement Preparation Notice (EISPN) under the authority of Act 172-12. State Parks submitted the EISPN to the State Office of Environmental Quality Control (OEQC) on February 9, 2015. Notice of the availability of the EISPN was published in the February 23, 2015 edition of *The Environmental Notice*. Copies of the EISPN were provided to the appropriate government agencies and other individuals and organizations as listed in Section 8.3.1. The public comment period for the EISPN began on February 23, 2015 and ended on March 25, 2015. Comments and responses on the EISPN received during the public comment period are incorporated in this EIS and the letters are provided in Section 12.0.

Following the EISPN, State Parks submitted the DEIS to OEQC on July 13, 2015 and Notice of the availability of the Draft EIS was published in the July 23, 2015 edition of OEQC's *The Environmental Notice*. Copies of the DEIS were provided to appropriate government agencies, public officials, and other organizations and individuals (see Section 8.3.2). The official 45-day public comment period on the DEIS began on July 23, 2015 and ended on September 8, 2015. However, State Parks held a public meeting on August 19, 2015 to gather more input on the DEIS and extended the DEIS public comment period until October 8, 2015. Comments on the DEIS received during this public comment period and the responses to the comments are incorporated in this FEIS and copies of those letters are included in Section 13.0.

# AGENCY AND COMMUNITY GROUP ENGAGEMENT

## 1.7 AGENCY AND COMMUNITY GROUP ENGAGEMENT

Throughout the planning process for this project, various Federal, State of Hawai‘i, and County of Kaua‘i agencies as well as community groups, organizations and individuals have been engaged in the development of the Master Plan. A thirty-two member Master Plan Advisory Committee (MPAC) consisting of Hā‘ena kūpuna and ‘ohana members, cultural practitioners and scientific experts, business representatives, State and County agencies, and other North Shore community members provided recommendations to the physical plan and park management. Following the publication of the availability of the DEIS by OEQC in the July 23, 2015 *The Environmental Notice*, State Parks held a public community meeting on August 19, 2015 to gather input on the DEIS. A new Hā‘ena State Park Community Advisory Committee (HSPCAC) composed of a portion of the original MPAC as well as new members from the community met regularly to refine the master plan. These efforts culminated in an open house held on July 23, 2016 at Hā‘ena State Park to present to the community the revised master plan. The additional input and feedback was collected and incorporated into the plan. The HSPCAC provided further guidance on finalizing the master plan at a meeting held in November 2016 and via email through May 2018. A summary of the public and community meetings that were held is provided in Table 2.

At the onset of the project, pre-consultation letters were issued soliciting input into the Master Plan and environmental documents, and periodically through the process, public meetings and open houses were held to keep the greater community informed of the concepts being considered for the Park. Appendix A includes a record of and materials from the public meetings held with community members regarding this project with a summary of the public meeting held on August 19, 2015 for the Draft EIS in Section 8.3.3. Chapter 11.0 contains the pre-consultation correspondence.

# MASTER PLAN SUMMARY

## 1.9.1 HĀ'ENA STATE PARK MASTER PLAN

The proposed master plan for Hā'ena State Park refines the master plan drafted in 2001 but never adopted with a renewed emphasis on the cultural and historic significance of Hā'ena. The Master Plan includes minimal physical improvements to the park in order to maintain the natural beauty and openness of the area. Only a few new structures are proposed including a Welcome Hale that is envisioned as an open traditional Hawaiian hale and located near the improved main parking lot. Interpretive and informational signage will be posted at the hale and two small comfort stations to the side of the main parking lot will provide a second set of facilities to reduce wastewater flows at the existing Kē'ē comfort station. The current overflow parking area will serve as the main parking lot and be resurfaced with permeable paving. In addition, a new entry turnaround and shuttle stop, and a new pedestrian-only path that connects the main parking lot with Kē'ē Beach through the lo'i are included in the plan. The new Pedestrian Path would follow along the first berm of the lo'i system closest to the highway. It is proposed to be placed just over the berm so as not to impact the berm or any of the historic resources and will maintain a low profile just above the berm. The new path will provide visitors with a unique view of Makana, a famous mountain peak, as well as views of the restored wetlands, loko, and lo'i as they walk to Kē'ē. Understanding there are funding limitations for improvements at State Parks, the Master Plan provides a Near-Term Plan for the Entry Complex (Figure 2) which includes a controlled entry for the park at a new Welcome Pavilion equipped with restrooms and the Interpretive Path which will provide access to Kē'ē Beach along an elevated boardwalk located makai of the current highway alignment to move the main visitor path outside of a projected rockfall hazard zone. The full buildout of the Master Plan is shown in Figure 1.

The main parking lot is envisioned to be flexible, but with a maximum of 100 striped stalls. The overall size of the main parking lot would be adjusted accordingly to support visitor use of third-party shuttles to the park, or the County's proposed North Shore shuttle should it be established, with the goal of right-sizing the parking lot. The idea is to accommodate local demand, complement shuttle volume, and minimize parking impacts outside of the park. In addition, the main parking lot would be separated into a fee-paying lot and non-fee paying lot by moveable bollards and cordons so the parking can be adaptively managed on an as-needed basis to support the varying numbers in either group parking at the park on any given day and throughout the day. A smaller special access parking lot will be located at Kē'ē in the existing paved areas. These stalls will be reserved for ADA accessibility, the lifeguards, park staff, the Hula Complex, and other cultural practices. It will also be accessible for emergencies as well as safety and rescue operations.

Other recommendations include reestablishing the area makai of the Kalalau trailhead and encompassing Ka Ulu a Paoa Heiau and the former Allerton property as a Hula Complex, recognizing the extreme significance of this ancient wahi kapu to hula practitioners worldwide. In addition, a Cultural Gathering Place will be created inland of Ka'īlio Point with a traditional

hale and Hālau Wa‘a, where educational and community programs could be staged, including overnight stays.

The plan also supports the continued restoration of the Agricultural Complex and encourages restoration of the varied historic, cultural, and natural resources throughout the park. It prioritizes the restoration of the dune complex as a potential first effort, recognizing the multiple benefits of ecological restoration, beach protection, and caring for the iwi kupuna. The plan also encourages green building design, integrated water use, reuse, and rainwater catchment, and renewable energy throughout the park. The latest proven green wastewater treatment technologies should be installed and these new facilities will also help lessen the use of the existing comfort station at Kē‘ē, which has sensitive cultural sites nearby.

Key management recommendations include: 1) the establishment of a Cultural Advisory Committee and a Community Advisory Committee, both of whom will be consulted on all aspects of park management and proposed improvements; 2) the implementation of adaptive management principles with regards to all management issues at the park; 3) instituting an initial limit of 900 visitors entering the park during peak park hours and calculated on an average daily basis as opposed to a hard limit; 4) required staff and volunteer education; and 5) visitor orientation prior to park entry.

The existing historic state highway that runs through the park is also recommended to be transferred from the State Department of Transportation to State Parks so that it may be closed to general through traffic and State Parks can shift the bulk of visitor traffic and parking outside of a potential rockfall hazard zone.

~~There are improved parking lots and a new entry turnaround shown in the proposed plans. However, there is also a unique opportunity currently being explored for State Parks to work with the County and other public agencies or to solicit a concession agreement with a third-party shuttle operator to initiate a North Shore shuttle and possibly a remote entry location in Princeville in the near term. If this happens, the size of the proposed parking lot in the Near-Term Plan and full buildout plan should be adjusted to support visitor use of the shuttle. The area no longer needed for parking at the entry could be converted into other park uses such as additional educational gardens and picnic areas, event space with a grand entry lawn, or more compact development of the entry facilities. An expanded shuttle stop with shelters, benches and informational signage may also be required if a shuttle is the primary means for park entry.~~

~~The full buildout of the Master Plan includes additional facilities such as a larger Educational and Cultural Center, which would replace the Welcome Pavilion as the point of entry for the park and a Caretaker’s Cottage which will support a 24-hour a day presence at the park. The area makai of the Kalalau trailhead and encompassing Ka Ulu a Paoa Heiau and the former Allerton property are combined to create the Hula Complex. Coordination with the County of Kaua‘i will be required as the heiau sits on County land. Other features of the master plan include the development of a Cultural Gathering Place inland of Ka‘Ōlio Point with a traditional hale and Hālau Wā‘ā, where educational and community programs could be staged including~~

overnight stays. Restoration of the dune complex as well as the continued restoration of the Agricultural Complex, Allerton Caretaker's Cottage, Montgomery House, and other historic, cultural, archaeological, and natural resources of the park are also recommended. Picnic areas, pedestrian and bicycle paths, expanded garden areas, integrated water/wastewater/drainage facilities, a permanent location for the lifeguard tower, baseyards and a helicopter landing area for DLNR and emergency use only are also elements of the proposed master plan.

The master plan includes key management strategies such as the establishment of a Cultural Advisory Group and community advisory group, and mandatory visitor orientation and education upon entry to the park. The existing historic State highway that runs through the park is also recommended to be transferred from the State Department of Transportation to State Parks so that it may be closed to general through traffic and allow State Parks to shift the bulk of visitor traffic within the park outside of a potential rockfall hazard zone.

A significant management proposal in the plan is to limit the number of people who can enter the park to 900 people per day as an initial ceiling. This number may be adjusted over time based on the impacts to the natural and cultural resources, traffic, public safety and visitor satisfaction at the park among other potential variables. This initial number includes day hikers on the Kalalau Trail but does not include overnight campers or hunters with valid permits, members of the Hui, or attendees at special education or cultural events such as volunteer workdays or events at the Hula Complex. This will encourage visitors to plan their visits in advance. State Park acknowledges that access will be an ever-evolving operational issue and will likely change over time as new policies are implemented. However, the goal is to study the impacts of these proposed policies over time and to adjust them as appropriate to improve the long-term management of park resources and visitor satisfaction.

# DESCRIPTION OF THE MASTER PLAN

## 2.5 DESCRIPTION OF THE MASTER PLAN

A site analysis was prepared to map the existing resources and to guide the appropriate location of Master Plan park elements (see Figure 8). The Master Plan presented in Figure 1 shows the full build-out of the plan and is the preferred alternative. Key components of the plan include new visitor and caretaker facilities, pedestrian and bicycle paths, a Hula Complex surrounding Ka Ulu a Paoa Heiau, a Cultural Gathering Area with Hālau Wa‘a and open hale, and changes to the park entry, vehicle circulation, and parking. To facilitate the initiation of the controlled entry and access changes at the park, a near-term plan for the entry complex was developed and is described in Section 2.5.1 (Near-Term Plan). It is also illustrated in Figure 2. Subsequent sections describe elements of the full build-out of the Master Plan.

### 2.5.1 NEAR-TERM PLAN FOR THE ENTRY COMPLEX

The Near-Term Plan for the entry complex presented in Figure 2 offers an interim plan to help initiate the managed access concepts and safety improvements within the park which are based on an updated rockfall hazard study prepared by AECOM (Appendix B). AECOM prepared a map showing the location beyond which the potential for simulated rockfalls diminishes to a 0% chance based on computer modeling. This line is shown on all the Master Plan graphics for reference and labeled as such. The Near-Term Plan as well as the Master Plan locates all the proposed visitor facilities makai of this line. The following sections are brief descriptions of the proposed features of the Near-Term Plan.

#### 2.5.1.1 Welcome Pavilion

A Welcome Pavilion is proposed where the main entry to the park can be managed prior to the construction of the Education and Cultural Center (described in Section 2.5.2.1). The primary function of the Welcome Pavilion is to provide orientation for all visitors prior to park entry. Public restroom facilities and an information desk are also included in the structure. Areas for interpretive displays, exhibits, picnic tables, and bicycle parking are provided outside of the pavilion. The leach field for the comfort station will be located beneath the parking lot. Dual waterlines will be installed for the comfort station and the lo‘i.

#### 2.5.1.2 Interpretive Path

Due to the potential for rockfall hazards along the highway, an Interpretive Path will be provided makai of the highway, connecting the Welcome Pavilion to Kē‘ē Beach. It will traverse the lo‘i as an elevated boardwalk running along the first berm separating the first two rows of lo‘i and then turn north to avoid the wetlands. It will cross an ‘auwai over a footbridge and connect to a path through the hau tree tunnel. This path will then connect to the trail behind the dunes and turn south, leading visitors past the lifeguard tower to Kē‘ē.

Interpretive displays and wayside exhibits will be installed along this path, including directional signage and educational information for the varied sights along this trail. The portion of the path which traverses the lo‘i will be elevated with handrails and a viewing

platform where the path turns. From here, distant views of Wai a Kanaloa can be seen as well as spectacular views of Makana, the lo'i, loko, and the wetlands. The path is proposed to be a minimum of eight to ten feet wide to accommodate bicycles without being overly intrusive upon the lo'i. Pathway footings are proposed to avoid structural impacts to lo'i walls. The path will be designed to be ADA accessible and made with lightweight, durable, easy to maintain, and vandal proof or vandal resistant materials. Directional and ocean safety signs are proposed to be posted appropriately along the path.

The exact alignment and materials used to construct the path will be determined when construction plans are prepared based on input from rockfall engineers, State Parks archaeologists and staff, the Cultural Advisory Group, and the Hui.

### ***2.5.1.3 Parking***

In the Near Term Plan, most of the visitor parking is consolidated into the main visitor parking lot as much of the highway will be closed to general traffic. In addition, a small ADA/special access parking area will be established at Kē'ē. The main parking lot is proposed to be re-graded, resurfaced, and landscaped with striped parking stalls. The preferred medium for surfacing the parking lot is a permeable pavement or structural grass over the entire parking lot or at least half of the parking lot so it can be used for multiple purposes. The exact surface will be determined when construction plans are prepared based on soil drainage and material availability. The parking lot as shown in the plan is large enough to park roughly 100 vehicles. However, to encourage use of the shuttle or transit system being planned for the North Shore, the number of available stalls may be reduced and the grassed areas of the lot can be used for outdoor activities, staging areas, lo'i, or educational purposes. The area shaded in a darker green in the plans shows how the parking lot could be partitioned for the different uses. If the shuttle system proves successful, the area may no longer be needed for parking and could permanently be converted into other park uses such as additional educational gardens and picnic areas, event space with a grand entry lawn, or expanded staging areas. The Welcome Pavilion/ECC could also be located further east to open up more garden spaces to the west.

The Master Plan also shows an 'auwai running along the mauka edge of the main parking lot that is in roughly the same alignment as the original 'auwai that used to traverse this area before it was cleared for the dirt parking lot. There have been requests by some members of the MPAC to determine whether it can be restored and made functional again, connecting to the rest of the 'auwai system. If restoration is pursued, further investigation will be necessary prior to detailed design of the parking lot to see if the 'auwai can be restored without extreme construction requirements or costs and if there is sufficient water quality and quantity. If the 'auwai can be restored, the grading and landscaping of this area should be done so that stormwater runoff from the parking lot is diverted away from the 'auwai and directed to flow across the grassed areas of the parking lot or towards bioswales and the adjacent landscaped areas could be designed as rain gardens to filter and contain the runoff. In addition, overflow drainage swales could be designed to help mitigate larger rainfall flows that may overtop the 'auwai. If it cannot be restored, another alternative is to aesthetically integrate its design into the drainage system and to see if it has potential for microhydropower generation.

~~This area can double as a catchment ditch for rockfall events with hala trees could also be planted in a thick screen along the highway and parking lot as an added rockfall mitigation measure and to soften the view of the highway from the ECC and Interpretive Path.~~

~~Pedestrian paths are proposed to be provided throughout the parking lot and drop-off/pick-up areas to clearly delineate where people should walk. The pedestrian path itself could be curbed or edged for easier maintenance and may be surfaced with permeable pavers or pavements or natural soil hardeners to increase rainwater infiltration while providing a stable, ADA-accessible surface. The exact surface will be determined when construction plans are prepared based on soil drainage and material availability.~~

~~The subterranean area of the parking lot will serve as an absorption bed for the proposed restroom facilities minimizing the amount of disturbed area required to service the proposed facilities.~~

~~The smaller 13-space ADA/special access parking lot will be located at Kēʻē for ADA accessibility, as well as to provide parking for the lifeguards, family members tending to the cemeteries, lawaiʻa, hunters, and cultural practitioners visiting the Hula Complex. The two existing ADA stalls will be maintained and directly opposite the highway from them will be an 11-stall parking area. Bicycle racks should be installed here if bicycles are permitted on the Interpretive Path.~~

~~Drainage improvements to prevent ponding, soil erosion, and beach washouts during heavy rainfall events are recommended. Access to this parking area will be managed by special permit or controlled by parking staff to minimize vehicle access along the limited access corridor.~~

#### ***2.5.1.4 Park Entry and Turnaround***

~~Initial discussions with State DOT have indicated they are willing to transfer the section of highway within the park to State Parks. Therefore the proposed plan recommends closing the highway to through traffic just past the park entry and includes a large vehicle turnaround with separate, gated accesses to and from the main parking lot, as well as to the ADA/special access parking area at Kēʻē and the separate staging area that could be used by State Parks or the Hui. A kiosk will be installed to control the gates either mechanically or manually by an operator. The gate will limit access along the highway to minimize visitor exposure to the rockfall hazards. Only those needing ADA vehicular access to Kēʻē, or special access to the cemeteries, hunting area within the Nāpali Coast State Wilderness Park, fishing grounds, and the Hula Complex will be allowed along the limited access portion of the highway. Warning signs will be installed at the gate. The gate across the highway could have a swing gate over the mauka half of the right-of-way that could be automated to open for exiting traffic only. Gate design will be included in construction drawings.~~

~~The central island of the turnaround will be landscaped, highlighted by a large hala tree or other native tree of significance to Hāʻena. An alternative for the centerpiece could be a~~

sculpture depicting something of significance to Hā‘ena or created by a Hā‘ena artist. The turnaround also would include sheltered seating areas to accommodate visitor drop-offs and pickups and shuttles/transit stops, as appropriate. The shade structures could also be designed with photovoltaic (PV) panels to help power the nearby facilities. Shade structure design is conceptual at this time.

#### ***2.5.1.5 Safety Signage***

Rockfall hazard warning signs should be installed as appropriate along the highway to discourage the general public from accessing the highway between the park entry and Kē‘ē, including the area around Wai a Kanaloa. In addition, directional and ocean safety signs should be posted at appropriate locations along the Interpretive Path, trails, and shoreline.

### **2.5.2 LONG-TERM MASTER PLAN**

Descriptions of the remaining elements of the full buildout of the Master Plan are provided in the following sections. Elements that remain from the Near Term Plan are not repeated here. Figure 1 illustrates the full buildout of the Master Plan and Figure 9 provides a detailed view of the entry area.

#### ***2.5.2.1 Education and Cultural Center***

The Education and Cultural Center (ECC) is envisioned as the main gathering place for all who visit the park. The ECC is anticipated to house administrative staff offices, comfort station facilities, auditorium/classroom space, meeting rooms, interpretive displays, storage rooms and other related spaces to support the park’s operations and activities. The ECC is proposed to be designed with covered outdoor lanai-type spaces to encourage indoor-outdoor experiences and learning spaces. The footprint as shown is roughly 2,000 square feet (s.f.). It incorporates the 1,200 s.f. footprint of the Welcome Pavilion from the Near Term Plan and adds two 400 s.f. wings at the back of the structure. However, the final architectural program, design, and facility size will be determined during the detailed design stage of the ECC. Its exact location may also be moved further east into the graded area of the parking lot based on the size of the final parking lot needed at the park. This shift would open up more park/event space makai of the facility and allow the smaller entry pavilion to operate while the ECC is constructed.

Because of Hā‘ena’s remote location and limited access to infrastructure, all aspects of green design is proposed for consideration whenever feasible to help the ECC operate self-sufficiently. To collect, filter, and reuse rainwater from the roof for irrigation, toilet flushing, and other possible uses, a rainwater catchment cistern is proposed. Renewable energy will be investigated during the building design process to help support the electrical demand of the facility with solar, microwind, and microhydropower<sup>†</sup> as potential alternatives.

---

<sup>†</sup>The U.S. Department of Energy defines a microhydropower system as a renewable energy system that typically generates up to 100 kilowatts of electricity. For reference, “a 10 kilowatt microhydropower system generally can provide enough power for a large home, a small resort, or a hobby farm.” (USDOE 2012)

#### ***2.5.2.2 Traditional Hale, Demonstration Gardens, Picnic Areas and Outdoor Event Space***

On the grounds surrounding the ECC are various outdoor spaces that are proposed for use as demonstration gardens and lo'i, tour staging areas, picnic areas, and outdoor event space. These areas are envisioned as flexible teaching spaces where outdoor demonstrations or classes could be held. They could also be landscaped with cultural and native plants, including kalo and Polynesian introduced plants, to aid in educational programs and may be used as staging areas for tours, school groups and community work days. A traditional hale is proposed to be constructed as a shelter for these activities. Its proposed location is in an existing cleared area which cannot be put back into lo'i production due to that area having previously abandoned cars and debris.

#### ***2.5.2.3 Reconstructed Hale and Lo'i Interpretive Site***

A traditional house foundation (Feature 8, Site 1600-8) is located on the northern side of the main parking lot. According to the State Parks archaeologists, it likely has been modified by the addition of a lanai in historic times. Recent reconnaissance of the site shows it to be in relatively good condition and provides an opportunity for a reconstructed hale pili and lo'i interpretive site at the entrance to the park. Final design of this area will be done once a more detailed condition analysis of the site is conducted and the feasibility of reconstruction is determined. The layout shown in the Master Plan is purely conceptual and subject to revision based on the condition analysis.

#### ***2.5.2.4 Caretaker's Cottage and Baseyard***

The Caretaker's Cottage is a feature from the 2001 draft park plan that some members of the MPAC felt was absolutely critical to preserve in the 2015 Master Plan. Having a caretaker at the park would provide a 24-hour presence at the park for security as well as provide someone to unlock the gates for hikers who wish to exit when the park is closed if the exit gate is not automated or is locked after hours.

The footprint of the Caretaker's Cottage as shown on the Master Plan is roughly 1,200 s.f. under the main roof with about 500 s.f. of covered lanai space. There are two potential baseyard areas, one of which is the area immediately surrounding the Caretaker's Cottage and measures over 6,400 s.f., but should include a protected buffer between the baseyard uses and the lo'i walls. The second area, which could also be used as a staging area or flexible space, measures roughly 4,800 s.f. and should similarly be buffered from the lo'i and 'auwai to the north and east, respectively.

These areas comprise previously disturbed land adjacent to the main parking lot. The final layout, location and sizing of the Caretaker's Cottage and baseyard will be dependent on the condition and exact locations of the lo'i walls, 'auwai, and traditional house site discussed in Section 2.5.2.3. Tall hedges or landscaping should be installed along the fences to secure the facility and to screen the facilities from public view. Similar to the ECC, green design and renewable energy are recommended. For hikers who need help after hours, and for any emergencies, an intercom or hardline emergency phone should be provided at the gate fronting the Caretaker's Cottage.

#### ***2.5.2.5 DLNR Helipad and Baseyard/Staging Area***

The helipad and baseyard/staging area will be used by DLNR for maintenance of their facilities including the Nāpali trails and sites. Since it is infrequently used, the helicopter landing area can be designed as a level, grassed site. The parking lot, entry complex, and helipad staging area will undergo a detailed design process prior to finalization to appropriately locate and size the facilities.

For emergency helicopter landings, the Fire Department tends to utilize the open grassy area near the Hui's current shelter. This area may continue to be used as an emergency landing zone as it is unsuitable for lo'i restoration and is proposed to remain as an open grassy field for educational and special events makai of the Welcome Pavilion/ECC. However, it is noted that the Fire Department will land wherever they need to as appropriate for the emergency situation.

#### ***2.5.2.6 Limited Access Corridor***

The highway between the turnaround and Kē'e will be closed to general vehicle traffic and used only for special vehicle access due to the potential rockfall hazard (Appendix B). The only vehicles that will be permitted beyond the gate will be special access vehicles such as the lifeguards, hula practitioners, family caretakers of the cemeteries, and vehicles with valid ADA placards or license plates. Because the road is currently owned by the State Department of Transportation (DOT), it will either need to be transferred to State Parks or an agreement must be made between the two state agencies for the proposed closure.

#### ***2.5.2.7 Hula Complex***

The entire area makai of the Kalalau Trailhead and south of the highway has been designated as the Hula Complex. It is the first priority of the MPAC to restore the area and to develop a culturally appropriate management plan. The complex includes Ka Ulu a Paoa Heiau and Ke Ahu a Laka, the former Allerton property, and the State lands surrounding them. Restoration of the heiau and Ke Ahu a Laka based on Henry Kekahuna's 1959 map (Figure 10) and all other available historical maps for the area is recommended.

The County has entered into an agreement with the Hui to care for the hula sites and is working with State Parks on access and coordination. It is recommended that appropriate cultural protocols be established as part of the management, access, and use of the area. Review by both the Kaua'i Historic Preservation Review Commission and the State Historic Preservation Division (SHPD) are required for any improvements and proposed management plans.

The Hui is also working on the rehabilitation of the historic Allerton Caretaker's Cottage and the Master Plan recommends reusing the structure to support park use, including the Hula Complex. The former Allerton house site and existing foundation is proposed in the Master Plan to be maintained as an open, grassed platform. State Parks notes that recent changes at the site may require short-term improvements to preserve it in place. If restroom facilities are provided within the area, potable water and an individual wastewater treatment system will be needed due to the remoteness of this facility. Sustainable design elements are proposed for

consideration to make it as self-sufficient as possible including high efficiency fixtures, renewable energy, rainwater catchment, and wastewater treatment and reuse.

#### ***2.5.2.8 Dune Restoration***

The dunes and beach strand were identified by both the MPAC and biologists at Geometrician Associates (Appendix C) as priority sites for restoration. For the MPAC, it would be an opportunity to take care of the kūpuna who are interred there. According to the biologists, the restoration of a native dune ecosystem would involve the removal of alien species and the planting of natives and Polynesian introduced plants such as Pōhuehue, Naupaka, Nanea, Pōhinahina, Nehe, Pa‘u o Hi‘iaka, ‘Aki‘aki grass, Milo, Hala and Kou. Not only would they provide improved and more authentic vegetation but they could also be used to help reduce coastal erosion if carefully planted. Restoration of the dune system would also improve the habitat for common native shorebirds, including the Kōlea or Pacific Golden Plover, ‘Ūlilī or Wandering Tattler, ‘Akekeke or Ruddy Turnstone, Kioea or Bristle-thighed Curlew, Hunakai or Sanderling, and various other sandpipers (Terry and Hart 2009).

Because the beach is one of the primary recreational resources at the park, visitors should clearly be instructed to be careful as they walk along the shoreline, especially east of the proposed lifeguard station since erosion is unearthing iwi and other cultural resources. The formal picnic areas that were shown on the dunes with picnic tables in the 2001 draft park plan have been removed and new picnic areas will be located on previously disturbed areas next to the Welcome Pavilion/ECC and on the paved areas at the end of the highway at Kē‘ē (Section 2.5.2.10). Visitors will still be permitted to picnic on the beach, but not on the dunes, and they will be encouraged to carry out all trash. The Master Plan further recommends that, to support dune restoration, recreational activities that impact the beach and dunes, such as driving on the sand (except for emergencies), be prohibited.

#### ***2.5.2.9 Lifeguard Tower***

A new permanent location for the lifeguard tower has been identified in the Master Plan with input from the MPAC and the Kē‘ē lifeguards (Listman, 2008). As shown in Figure 1, it is roughly 50 feet north of the highway pavement and 50 feet mauka of the 2009 certified shoreline to allow views from the end of the path to open up to the ocean and improve visibility for the lifeguards. The site is located outside any known flood hazard zone or wetland. To avoid potential impact to subsurface resources, the foundation should be built up rather than excavated down into the sand, if possible. Also, some of the existing ironwood trees may have to be cut.

#### ***2.5.2.10 Picnic Area at Kē‘ē***

Picnic tables will be located on the old highway pavement at the entrance to Kē‘ē Beach to provide ADA accessibility. The area is shaded by trees and overlooks the beach and lagoon.

#### ***2.5.2.11 Loko and Wetland Restoration***

Some members of the MPAC expressed a desire to restore the loko and wetland areas for endangered native birds and possible agricultural uses. Loko Naia is believed to have been a loko kalo and Loko Kē'ē either a fishpond or loko kalo.

Restoration of the small wetlands on the property for the purpose of creating a native bird habitat is a possibility according to Geometrician Associates. However, they do not recommend modifying these areas specifically to attract endangered birds for practical and legal reasons. In order to do so, there are several binding agreements and permits that must be obtained with the U.S. Fish and Wildlife Service (USFWS), such as a Safe Harbor Agreement and associated enhancement of survival permit as well as increased responsibility to protect the native birds once they are established at the park. Additionally, its location near the main public corridor would increase the potential for endangered birds to be harassed, injured or killed directly or indirectly by people or their pets and may be difficult to manage.

They do, however, recommend restoring the native flora which would increase native plant conservation and opportunities to educate the public. This may also indirectly support native birds including endangered and threatened species without a formal effort to create an endangered species habitat. A third party agreement with a local organization that may want to take on the responsibility of creating and maintaining such a habitat if a formal endangered species habitat may be another option. If pursued, the wetlands should be protected through fencing hidden with landscaping or fringing vegetation that encourages viewing but discourages direct entry to help minimize access by predators (Appendix C).

#### ***2.5.2.12 Limahuli Stream Restoration***

Based on recommendations from Geometrician Associates in Appendix C, a natural area with potential for beneficial impact is restoration of the riparian areas around Limahuli Stream. The alien tree species that form a dense, closed canopy around the stream are especially problematic since they effectively prevent sunlight from reaching the ground and prevent the mid-canopy and ground cover layers in the forest from developing. This in turn increases sediment loading in the stream due to erosion and tree litter. Reduced sunlight also limits the growth of benthic algae in streams. The algae are a major food source for many rare and federally endangered native fish and invertebrates. A reduction in this important food source, coupled with increased sediment loading, could ultimately result in decreased quality of streams.

Careful clearing of the alien trees along Limahuli Stream and the planting of appropriate native and Polynesian introduced plants to stabilize slopes are recommended. In order to prevent impacts to 'Ōpe'ape'a, the Hawaiian Hoary Bat, State Parks should restrict any cutting of large shrubs or trees over fifteen feet tall to periods outside of the June 1 through September 15 breeding and pupping season. Continued cooperation with the Division of Aquatic Resources (DAR) to keep new alien fish out of the 'auwai and stream and in ridding the stream of periodic invasions of swordtails, guppies, and other alien fish is recommended. Details of stream and riparian restoration will be deferred until a restoration plan can be prepared.

### ***2.5.2.13 Agricultural Complex***

In order to create a living cultural Agricultural Complex, community gardening practices restoring the lo'i should be continued (Carpenter, 1996). The restoration phases as recommended in the Major and Carpenter (2000) restoration plan are labeled in parentheses on Figure 1. The MPAC would like to allow for other cultural crops to be planted in addition to kalo. Historically, the complex was known to be flexible, allowing dryland cultivation to be done by simply redirecting water through different paths. 'Uala, or sweet potatoes, were known to be grown in sandy areas and mai'a (bananas), kō (sugar cane), and 'awa (*Piper methysticum*) were grown in the valleys.

Restoration of the 'auwai is also recommended wherever feasible, particularly in actively cultivated areas of the lo'i. Special care, however, needs to be taken not to make a hydraulic connection between the lo'i and 'auwai back to Limahuli Stream to prevent the spread of apple snails. Limahuli Stream is one of the few places in the State that does not have apple snails and the snails are currently in the park's lo'i.

The 2001 draft park plan also included pedestrian and bicycle pathways throughout the lo'i, primarily along and sometimes through the 'auwai. This is no longer recommended since the goal is to reestablish the 'auwai as the primary means of irrigating the lo'i. The plan currently locates the Interpretive Path over the first berm within the lo'i and will provide visitors an up-close view of the lo'i on their way to Kē'ē.

In addition, access to and/or through certain areas of the lo'i is required for both people and equipment as a part of ongoing maintenance and harvesting. For safety reasons, access within the working lo'i should therefore be managed and primarily reserved for those restoring the lo'i as well as for educational and work groups tending to the lo'i. Special tours for the public and educational groups guided by knowledgeable staff may also be arranged. These access ways shall be designed and constructed as the restoration of the lo'i progresses in order to appropriately locate them within the complex.

### ***2.5.2.14 Montgomery House***

Rehabilitation of the historic Montgomery House/Cottage situated within the Agricultural Complex is proposed to support agricultural activities or other park uses/operations. Similar to the Allerton Caretaker's Cottage, if restroom facilities are provided, potable water and an individual wastewater treatment system will be needed. Sustainable design elements should be considered to make it as self-sufficient as possible including high efficiency fixtures, renewable energy, rainwater catchment, and wastewater treatment and reuse.

### ***2.5.2.15 Cultural Gathering Place and Hālau Wa'a***

Tucked between the lo'i, Loko Naia and former coastal road, and up on higher ground, the Cultural Gathering Place is envisioned in the Master Plan as an outdoor gathering place to support community/educational groups and where overnight stays would be permitted. The Cultural Gathering Place is in an area of recent 20th century modification and encompasses the site of the historic poi mill.

An open hālau-type structure and Hālau Wa‘a, or canoe house, is also proposed to the east of the Cultural Gathering Place. Approximate locations of these facilities are shown in the Master Plan. However, because this area is located near potentially sensitive cultural sites, the exact extent of the area and location of the structures should be determined with input from State archaeologists and staff, the community, and kūpuna. In addition, the Hālau Wa‘a should be located as makai as possible without impacting sensitive sites and the dune system or being within areas of special flood and wave hazards. For infrastructure, potable water will be needed. Composting toilets should be considered as an option for restroom facilities or temporary restrooms could be brought in and removed as necessary to serve the campers. Alien plant species are proposed to be removed from the area and replanted with native and Polynesian-introduced plants.

#### ***2.5.2.16 Poi Mill***

In the 2001 draft plan, interpretation of the historic poi mill is recommended. However, no cost estimates were included for any reconstruction work. As remnants of the concrete foundation still remain, the MPAC discussed whether the poi mill could be rebuilt in order to process harvests from the lo‘i. However, the site is located in an area of potential flood hazard due to wave action, according to the Flood Insurance Rate Map (FIRM) and if State Parks or another entity wishes to reestablish a poi mill on site or within the park, additional studies are recommended to determine the most suitable location, design, and size for such a facility. Therefore, the site itself is recommended to be interpreted with signage or displays and included on guided tours.

#### ***2.5.2.17 Cemetery Areas***

The two historic cemeteries that are just north of the loko are currently maintained by family members. In the 1996 Burial Treatment Plan (Carpenter, 1996), there are recommendations to install signage and fence or wall off and gate the cemetery areas, with access provided to lineal descendants and State personnel. However, during the MPAC meetings a request was made to eliminate the fencing and gates. Rather than using fences or walls, landscaping and the use of native and Polynesian-introduced plants should be considered as more natural buffers for the area. Any signage that is installed should be designed with input from the families of those interred there.

#### ***2.5.2.18 Pedestrian Trails***

As discussed in the Near Term Plan, the Interpretive Path will serve as the main pedestrian route between the ECC and Kē‘ē. It will be located outside the area of the known rockfall hazard and will also serve as the primary ADA-accessible route. The proposed alignment was developed with Hui leadership and the final design is subject to refinement including input from the Hui, State archaeologists, Cultural Advisory Group, and rockfall engineers.

The old coastal road behind the dune, which will be used for restricted vehicle access to the lo‘i, cemetery and Cultural Gathering Place, is also proposed as a potential new pedestrian trail. Its location behind the dunes provides shelter from the winds and provides an alternate

route to Poholoikeiki Channel, the Hālau Wa‘a, and the historic poi mill site and passes by Loko Naia. In the Master Plan, this pathway is not envisioned as a paved, improved trail. Ocean safety signage, interpretive displays and wayside exhibits should be installed as appropriate. Bicycles should not be permitted on this portion of the trail due to the sensitivity of the area.

Another potential pedestrian trail could be developed to connect the ECC directly to the Hālau Wa‘a site through the proposed native plant and lo‘i demonstration gardens along an existing path at the edge of the Phase I lo‘i restoration. These trails together will provide a pedestrian loop trail through the most active areas of the Park as well as opportunities for diverse interpretive experiences. Signage, landscaping and trail markings may be installed to direct visitors towards appropriate areas and away from sensitive or hazardous areas. This loop trail serves as an alternate route back to the ECC and main parking lot. The exact alignment of all trails should be developed with input from State archaeologists, the Hui leadership, and the Cultural Advisory Group.

Additional pedestrian loop trails on the eastern side of the park should also be considered and designed in conjunction with the surveying and restoration of the lo‘i (Phases III and IV). All trails will need to be designed based on more detailed survey of the archaeological sites and to loop back to the ECC if access to these areas is to be managed.

#### ***2.5.2.19 Bicycle Facilities***

Bicycle racks will be provided at the ECC (and the Welcome Pavilion in the Near-Term Plan) and if bicycling is permitted on the Interpretive Path, racks may be installed at Kē‘ē near the special access parking lot. However, riders will be required to travel at low speeds since the path is also the main pedestrian and ADA-accessible route. They will also be required to walk their bicycles between the large viewing platform on the Interpretive Path and Kē‘ē due to the sensitivities along the sand dune and potential for pedestrian-bicycle conflicts in the Hau Tunnel and at the viewing platform. If conflicts between pedestrians and bicyclists arise, bicycle riding on the Interpretive Path may be discontinued.

As an alternative, bicyclists could be allowed on the limited access portion of the former highway but they would be permitted at their own risk of rockfalls. If permitted, bicycle racks should be installed at Kē‘ē. To encourage bicycle access to the park, bicycle parking, according to the Pedestrian and Bicycling Information Center, should include sturdy racks that are visible (for security), accessible, easy to use, and convenient. Ideally, bicycle racks should support the whole bicycle and not just one wheel, and enable the user to lock the frame and wheels.

### **2.5.1 VISION FOR HĀ‘ENA MASTER PLAN**

The following section provides conceptual descriptions of the key features of the master plan. It starts at the park entrance and continues toward Kē‘ē. The exact locations and designs of the proposed features are subject to change and refinement during the detailed design and construction phases based on conditions at the time of implementation.

### **2.5.1.1 Park Entry, Turnaround, and New Main Gate**

A new vehicle gate is recommended to be installed at the park entry when the highway is transferred to State Parks. Only those with special access to Kēʻē, such as the lifeguards and rescue personnel, those with valid ADA parking placards or plates, park staff, the Hula Complex and other cultural practitioners, will be allowed to drive along the former highway as needed to reduce visitor exposure to the rockfall hazards. It will have a separate entry off the turnaround. Rockfall hazard warning signs will be installed on the gate across the highway and a swing gate on the mauka half of the right-of-way could be automated to open for exiting traffic only. The design of the gate will be open and remain low in height to minimize the visual impact towards Kēʻē.

A vehicle turnaround is provided just past the park entry and provides separate accesses to and from the main parking lot, as well as the special access parking at Kēʻē, and a separate staging area that could be used for various park purposes. The turnaround is designed to include the shuttle stop and/or bus stop if/when such services become available and allow those dropping off visitors to pull over at the curb without blocking traffic. Shade structures are also provided to shelter those waiting at the visitor drop-off and pick-up areas. Shuttle and bus schedules should be posted at the stop if they are established. Should shuttle or transit service to the park become successful enough to eliminate or reduce the need for the parking lot, the shuttle stop area can be enlarged to accommodate the required passenger drop offs and pick-ups. The shade structures could also be designed with photovoltaic panels to help power the nearby facilities.

### **2.5.1.2 Parking**

Most of the visitor parking will be consolidated into one main visitor parking lot near the park entry as much of the highway will be closed to general traffic. Only a small special access parking area will remain at Kēʻē as noted earlier for ADA accessibility, the lifeguards, park staff, the Hula Complex and other cultural practices. It will also be accessible for emergencies as well as safety and rescue operations.

The preferred medium for the parking lot is permeable pavement or structural grass over the entire parking lot or at least half of the parking lot so it can be used for multiple purposes. The parking lot as shown in the plan is large enough to accommodate roughly 100 vehicles. However, to encourage the use of a shuttle or transit system being planned for the North Shore, the number of available stalls may be reduced as appropriate and the grassed areas around the parking lot can be used for outdoor activities, staging areas, or educational purposes related to the adjacent traditional house site and loʻi. Eventually, if the shuttle or transit system proves successful, the areas no longer needed for parking could permanently be converted into an expanded shuttle stop area or other park uses. In the interim, the areas shown in different shades of green in Figure 1 show how the parking lot could be partitioned for different users, whether they are fee-paying visitors or non-fee paying visitors, and can be adjusted with movable bollards and cordons depending on the number of cars for each user group. The division between the two can be adaptively managed weekly, daily, or even hourly throughout the day depending on demand. This design gives State Parks the flexibility to provide enough parking until the shuttle/transit system is operational and to adjust as needed the number of parking

stalls that are available for the different user groups while also encouraging multimodal access to the park.

Pedestrian paths should be provided throughout the parking lot and drop-off/pick up areas to clearly delineate safe places where people should walk and direct visitors towards the park entry. The pedestrian paths could be curbed or edged for easier maintenance and should be surfaced with permeable pavers or pavements or natural soil hardeners to increase rainwater infiltration while providing a stable, weatherproof surface. If electric vehicle parking and charging stations are provided, they must comply with the State Disability and Communications Access Board (DCAB) Interpretive Opinion 2012-01, which states, 'Where EV charging stations are provided, 5%, but not less than one of each type of EV station shall be accessible.

At the special access parking area, bicycle racks should also be installed and drainage improvements should be made in the area to prevent ponding, soil erosion, and beach washouts as has happened at Kē'ē during heavy rainfall events. It is also recommended that access to this special access parking area be managed by special permit or access codes at a controlled entry off the turnaround. Access should also be coordinated with safety and rescue personnel during emergencies and rescue operations.

#### **2.5.1.3 Welcome Hale and Restrooms**

The Welcome Hale is envisioned as an open pavilion without walls where information about the park can be posted. The displays should include a park map and orientation information, park rules and cultural protocols. Daily weather, ocean and hazard conditions could also be posted at the Welcome Hale.

New public restrooms and bicycle parking are provided outside of the hale near the main parking lot. This second set of restrooms will help reduce the use of the Kē'ē comfort station, which is located near sensitive archaeological sites. Technological advances in individual wastewater treatment systems are providing higher-quality effluents and should be considered when designing the new restrooms. If possible, the effluent should be reused and the leach field for the new restrooms could be located beneath the parking lot. Dual waterlines and rainwater catchment systems can also be installed for the restrooms and the lo'i to minimize potable water use. Solar photovoltaic systems can also be installed to support electrical needs.

#### **2.5.1.4 Pedestrian Path**

Due to the potential for rockfall hazards along the highway, a pedestrian path will be provided makai of the highway, connecting the Welcome Hale to Kē'ē Beach. It will traverse the lo'i along the first berm separating the first two rows of lo'i and then turn north to avoid the wetlands. It will cross an 'auwai over a footbridge and connect to a path through the hau tunnel. This path will then connect to the trail behind the dunes and turn south, leading visitors past the comfort stations and lifeguard tower to Kē'ē. The path will remain low to the ground but just above the berm, with structural supports located to avoid any archaeological sites. Handrails or path edging will be provided for safety if needed. It should also be designed with

lightweight, durable, and easy-to-maintain materials that are resistant to vandalism and weathering.

Interpretive displays and wayside exhibits will be installed along this path, including directional signage and educational information for the varied sights along this trail. From here, distant views of Wai a Kanaloa can be seen as well as spectacular views of Makana, the lo'i, loko and the wetlands.

#### **2.5.1.5 Restored 'Auwai**

The master plan shows an 'auwai running along the mauka edge of the parking lot. It is in roughly the same alignment as the original 'auwai that used to cut through this area before it was cleared for the dirt parking lot. There have been requests by some members of the MPAC to determine whether it can be restored and made functional again, connecting to the rest of the 'auwai system. Further investigation to see if the 'auwai can be restored to serve the lo'i without extreme requirements or costs should be done prior to detailed design of the parking lot. If it is found that it can be restored, the grading and landscaping of this area should be done so that stormwater runoff from the parking lot is diverted away from the 'auwai and directed to flow across the grassed areas of the parking lot or bioswales and adjacent landscaped areas which could be designed as rain gardens. In addition, overflow drainage swales could be designed in this area to help mitigate larger rainfall flows that may overtop the 'auwai. If it cannot be restored as an 'auwai, another alternative is to aesthetically integrate its design into the drainage system and to see if it has potential for microhydro power generation. This area can also double as a catchment ditch for rockfall events. Native or Polynesian-introduced trees could also be planted in a thick screen along the highway and parking lot as an added rockfall mitigation measure and to soften the view of the highway from the pedestrian path.

#### **2.5.1.6 Reconstructed Hale and Lo'i Interpretive Site**

A traditional house site (Feature 8, Site 1600-8) is located on the northern side of the main parking lot. According to the State Parks archaeologists, it likely has been modified by the addition of a lanai in historic times. Recent reconnaissance of the site shows it to be in relatively good condition and provides an opportunity for a reconstructed hale pili and lo'i interpretive site at the entrance to the park. Final design of this area will be done once a more detailed condition analysis of the site is conducted and the feasibility of reconstruction is determined. The layout shown in the master plan is purely conceptual and subject to revision based on the condition analysis. Access to the site should be designed to be ADA accessible from the parking lot if possible.

#### **2.5.1.7 DLNR Helipad and Staging Area**

The helipad and staging area will be used only by DLNR for maintenance of their facilities including the Nāpali trails and sites. One potential location is makai of the entry turnaround and will need to be designed with the new turnaround so the area is large enough and does not impact archaeological sites. Since it is infrequently used, the helicopter landing area can be

designed as a level, grassed site. The final design and location, however, will be decided upon as part of the detailed design process for the main parking lot and entry complex.

For emergency helicopter landings, the Fire Department prefers the open grassy area near the Hui's current shelter, which is marked on the master plan as an alternate landing area. This area may continue to be used as an emergency landing zone as it is unsuitable for lo'i restoration and proposed to remain as an open grassy field for educational and special events makai of the Welcome Hale. However, the Fire Department noted they will land wherever they need to as appropriate for the emergency situation.

#### **2.5.1.8 Limited Access Corridor**

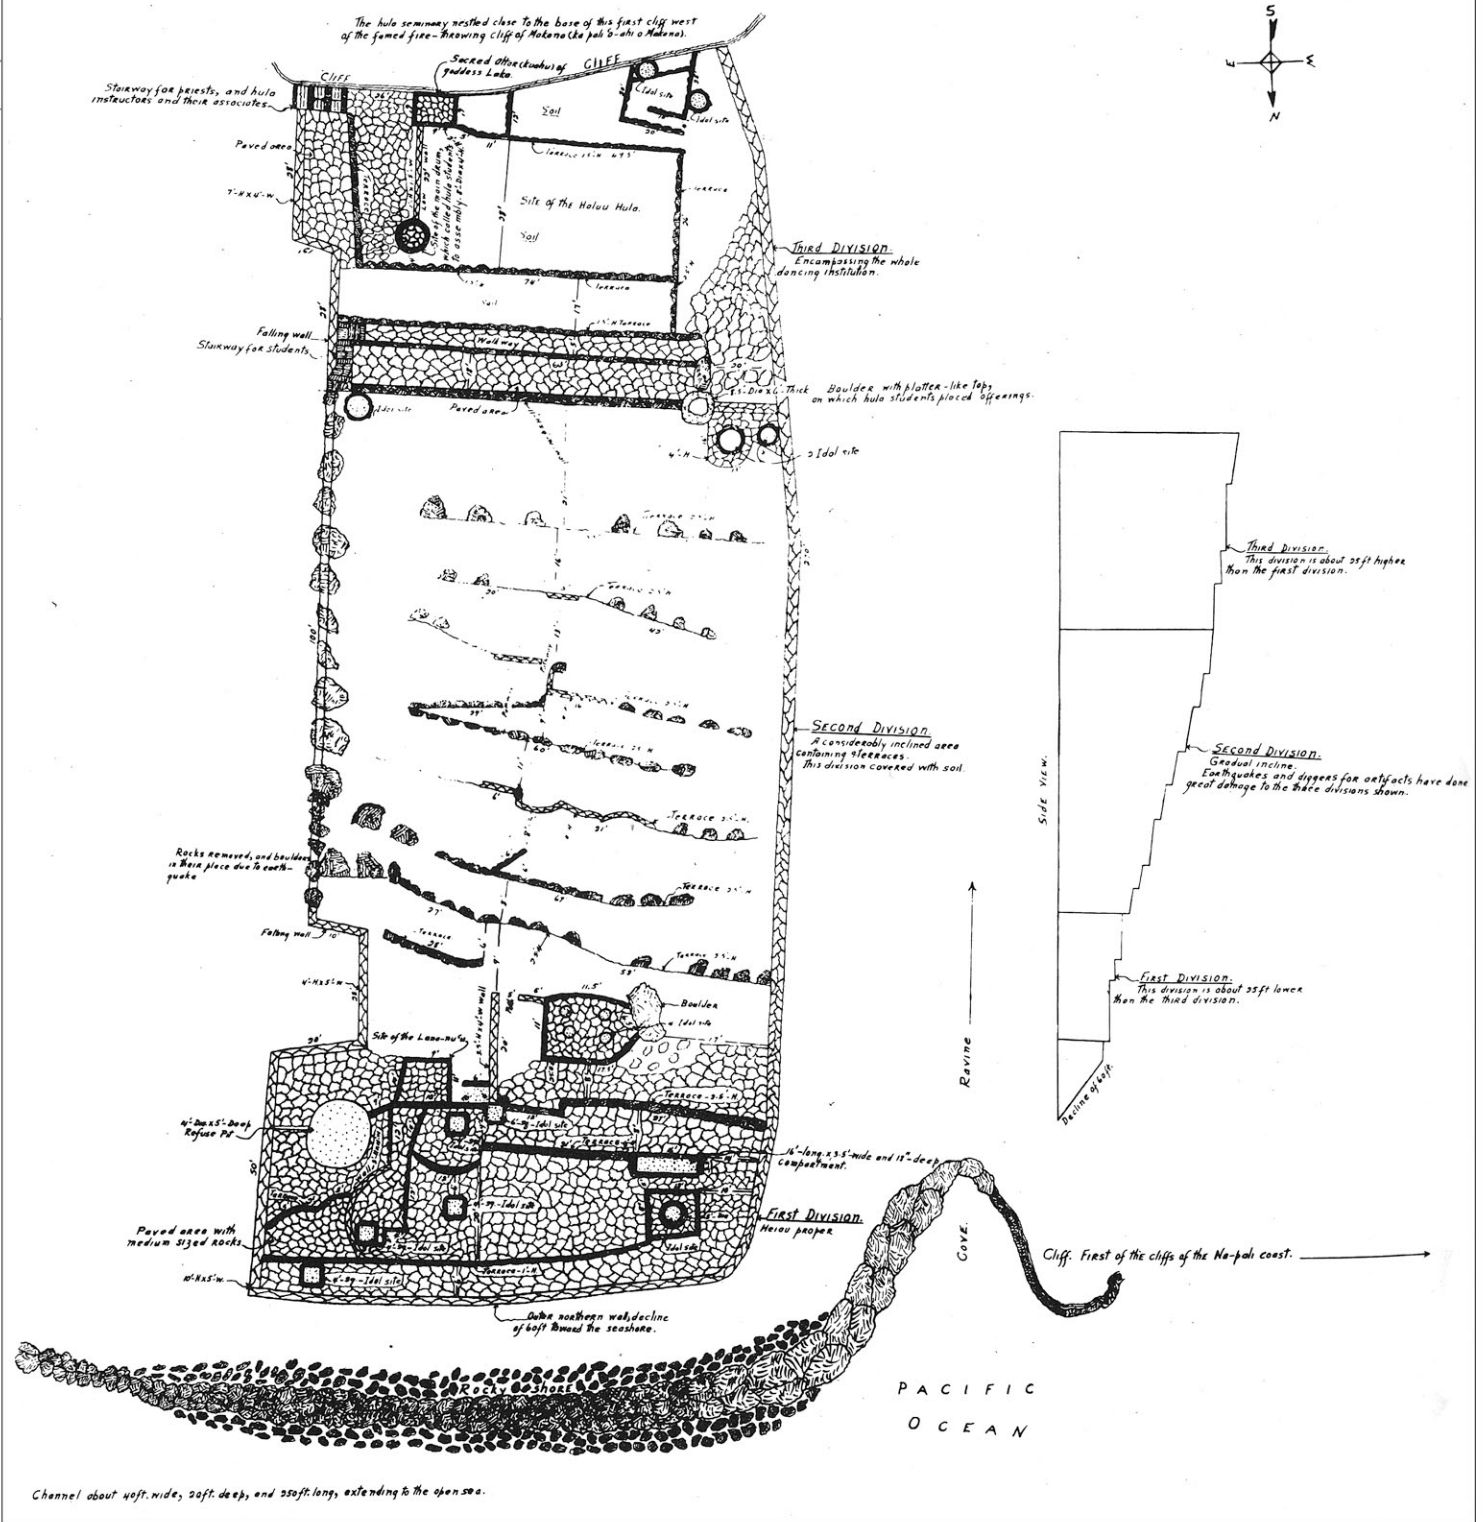

The highway between the turnaround and Kē'ē will be closed to general vehicle traffic and used only for special vehicle access due to the potential rockfall hazard. The only vehicles that will be permitted beyond the gate will be special access vehicles such as the lifeguards and emergency and rescue teams, park staff, hula and other cultural practitioners, and ADA vehicles. Because this segment of the highway is currently owned by the State Department of Transportation, it will need to be transferred to State Parks or an agreement must be made between the two state agencies for State Parks to take over management of it. In emergency situations such as tsunami warnings, visitors will be able to evacuate along this corridor to escape to higher ground and out of the park if it is deemed safe.

#### **2.5.1.9 Hula Complex**

Given the extreme importance of the ancient Ka Ulu a Paoa Heiau and Ke Ahu a Laka and their worldwide recognition as a wahi kapu, the entire area makai of the Kalalau Trailhead and encompassing the area around the heiau and former Allerton Estate is designated as the Hula Complex. It is the first priority of the MPAC to restore the area and to develop a culturally appropriate management plan. Restoration of the heiau and Ke Ahu a Laka utilizing Kekahuna's map (Figure 10) and all available maps is recommended.

The County has established a stewardship agreement with Hui Maka'āinana o Makana to care for the sites within its parcel and is working with State Parks on access and coordination. It is recommended that appropriate cultural protocols be established as part of the management, access, and use of the area. Review by both KHPRC and SHPD will be required for any improvements and proposed management plans.

**FIGURE 10**  
Kekahuna's 1959 Drawing  
of Ka Ulu A Paoa Heiau  
**HĀ'ENA STATE PARK**

Department of Land and Natural Resources

Island of Kaua'i

NOT TO SCALE

Rehabilitation of the historic Allerton Caretaker's Cottage is currently underway for reuse to support park use, including the Hula Complex. The Allerton house site and existing foundation should be maintained as an open, grassed platform as hula hālau often use that area. State Parks notes that recent changes at the site may require emergency improvements to preserve it in place. If restroom facilities are provided, potable water and an individual wastewater treatment system will be needed due to the remoteness of this facility. Sustainable design elements should be considered to make it as self-sufficient as possible including high efficiency fixtures, renewable energy, rainwater catchment, and wastewater treatment and reuse.

#### **2.5.1.10 Dune Restoration**

The dunes and beach strand were identified by both the MPAC and biologists at Geometrician Associates as priority sites for restoration. For the MPAC, it would be an opportunity to take care of the iwi kūpuna interred there. According to the biologists, the restoration of a native dune ecosystem would involve the removal of alien species and the planting of natives and Polynesian-introduced plants such as pōhuehue, naupaka, nanea, pōhinahina, nehe, pa'u-o-Hi'iaka, 'aki'aki grass, milo, hala and kou. Not only would they provide improved and more authentic vegetation but they could also be used to help reduce coastal erosion if carefully planted. Restoration of the dune system would also improve habitat for common native shorebirds, including kōlea, 'ūlili, 'akekeke or ruddy turnstone, kioea or bristle-thighed curlew, hunakai or sanderling, and sandpiper.

Also, because the beach is one of the primary recreational resources at the park, visitors should clearly be instructed to be careful as they walk along the coast, especially east of the proposed lifeguard station since shoreline erosion is unearthing iwi and other cultural resources. The formal picnic areas that were shown on the dunes with tables in the 2001 Draft Park Plan have been removed and a new picnic area will be located at the end of the existing highway pavement at Kē'ē. Visitors, however, will still be permitted to picnic on the beach, but not on the dunes, and all trash will be encouraged to be carried out with them. Recreational activities that negatively impact the beach and dunes should be prohibited.

#### **2.5.1.11 Lifeguard Tower**

A new permanent location for the lifeguard tower has been identified with input from the MPAC and the Kē'ē lifeguards. It is roughly 50 feet north of the highway pavement and 50 feet mauka of the 2009 certified shoreline to allow views from the end of the path to open up to the ocean and improve visibility for the lifeguards. The site is located outside any known flood hazard zone or wetland. To avoid potential impact to subsurface resources, the foundation should be built up rather than excavating down into the dunes, if possible. Also, some of the existing ironwood trees may have to be cut. When asked, the lifeguards agreed the proposed site will improve their ability to see key areas of the lagoon and Kē'ē Channel compared to their current temporary location at the end of the highway pavement.

#### **2.5.1.12 Picnic Area at Kēʻē**

Picnicking is permitted at Kēʻē Beach. However, a formal picnic area with picnic tables will be located at the end of the former highway pavement at the entrance to Kēʻē Beach. The area is shaded by trees and overlooks the beach and lagoon. The tables can be placed on the old highway pavement to provide ADA accessibility.

#### **2.5.1.13 Loko and Wetland Restoration**

Some members of the MPAC expressed a desire to restore the loko and wetland areas for endangered native birds and possible agricultural uses. Loko Naia is believed to have been a loko kalo and Loko Kēʻē either a fishpond or loko kalo. However, Geometrician Associates do not recommend modifying these areas specifically to attract endangered birds for practical and legal reasons. There are several binding agreements and permits that must be obtained with the U.S. Fish and Wildlife Service in order to do so, such as a Safe Harbor Agreement and associated enhancement of survival permit as well as increased responsibility to protect the native birds once they are established at the park. They also caution its location near the main public corridor would also increase the potential for endangered birds to be harassed, injured or killed directly or indirectly by people or their pets and may be difficult to manage.

They do, however, recommend restoring the native flora which would increase native plant conservation and opportunities to educate the public. This may also indirectly support native birds including endangered and threatened species without a formal effort to create an endangered species habitat. The State could also consider a third-party agreement with a local organization that may want to take on the responsibility of creating and maintaining such a habitat if a formal endangered species habitat is desired. If pursued, the wetlands should be protected through fringing vegetation that encourages viewing but discourages direct entry and possibly fencing shielded by landscaping to help minimize access by predators.

#### **2.5.1.14 Limahuli Stream Restoration**

Based on recommendations from Geometrician Associates, the restoration of the riparian areas around Limahuli Stream is another natural area with the potential for multiple beneficial impacts. The alien tree species that form a dense, closed canopy around the stream are especially problematic since they effectively prevent sunlight from reaching the ground and prevent the mid-canopy and ground cover layers in the forest from developing. This in turn increases sediment loading in the stream due to erosion and tree litter. Reduced sunlight also limits the growth of benthic algae in streams. The algae are a major food source for many rare and federally endangered native fish and invertebrates. A reduction in this important food source, coupled with increased sediment loading, could ultimately result in decreased habitat quality of streams. They recommend careful clearing of the alien trees along Limahuli Stream and the planting of appropriate native and Polynesian-introduced plants to stabilize the slopes.

In order to prevent potential impacts to ʻōpeʻapeʻa, the native Hawaiian hoary bats, State Parks will restrict any cutting of large shrubs or trees taller than fifteen feet in height to periods outside the June 1 through September 15 breeding season for the ʻōpeʻapeʻa. State Parks will continue to cooperate with the State Division of Aquatic Resources to keep new alien fish out

of the ‘auwai and stream and in ridding the stream of periodic invasions of swordtails, guppies, and other alien fish. Additional consideration should be given to working with neighboring landowners as well as those ma uka up Limahuli Valley if restoration is pursued.

#### **2.5.1.15    *Agricultural Complex***

In order to create a living cultural agricultural complex, it is recommended that community gardening practices continue the restoration of the lo‘i as recommended in the restoration plans already in place. One request of the MPAC was to allow for other cultural crops to be planted in addition to kalo. Historically, the complex was known to be flexible; water was redirected to allow certain areas to be used for dryland cultivation. ‘Uala, or sweet potatoes, were known to be grown in sandy areas and mai‘a (bananas), kō (sugar cane), and ‘awa (*Piper methysticum*) were grown in the valleys.

Restoration of the ‘auwai is also recommended wherever feasible, particularly in actively cultivated areas of the lo‘i. Special care, however, needs to be taken not to hydraulically connect the lo‘i and ‘auwai back to Limahuli Stream to prevent the spread of apple snails. Limahuli Stream is one of the few places in the state that does not have apple snails and the snails are currently in the park’s lo‘i.

The 2001 Draft Park Plan also included pedestrian and bicycle pathways throughout the lo‘i, primarily along and sometimes through the ‘auwai. This is no longer recommended since the goal is to reestablish the ‘auwai as the primary means of irrigating the lo‘i. The plan currently locates the main pedestrian path over the first berm within the lo‘i and will provide visitors a close-up view of the lo‘i on their way to Kē‘ē. There may also be opportunities for interactive educational activities within the first row of lo‘i for visitors, away from the Hui's restoration work, which will continue makai and east.

Access to and/or through certain areas of the lo‘i is required for both people and equipment as a part of ongoing maintenance and harvesting. For safety reasons, access within the working lo‘i should therefore be managed and primarily reserved for those restoring the lo‘i as well as for educational and work groups tending to the lo‘i.

#### **2.5.1.16    *Montgomery House***

The historic Montgomery House situated within the Agricultural Complex is recommended for rehabilitation to support park uses. The facility could be used to support the agricultural activities or other park uses and operations. Similar to the Allerton Caretaker’s Cottage, if restroom facilities are provided, potable water and an individual wastewater treatment system will be needed. Sustainable design elements should be considered to make it as self-sufficient as possible including high efficiency fixtures, renewable energy, rainwater catchment, and wastewater treatment and reuse.

#### **2.5.1.17    *Cultural Gathering Place and Hālau Wa‘a***

Tucked between the lo‘i, Loko Naia and former coastal road, and up on higher ground, the Cultural Gathering Place (CGP) is envisioned as an outdoor gathering place to support

community and educational groups and where overnight stays would be permitted. The CGP is in an area of recent 20th century modification and encompasses the site of the historic poi mill.

An open hālau-type structure and Hālau Wa‘a, or canoe house, is also proposed on the makai side of the CGP. Approximate locations of these structures are shown in the master plan. However, because this area is located near potentially sensitive cultural sites, the exact extent of the area and location of the structures should be determined with input from State Parks archaeologists and staff, the community and cultural advisory groups, and kūpuna. In addition, the Hālau Wa‘a should be located as makai as possible without impacting sensitive sites and the dune system. For infrastructure, potable water will be needed. Composting toilets or other innovative wastewater treatment technologies should be considered for restroom facilities. Alien plant species should be removed and replaced with native and Polynesian-introduced plants.

#### **2.5.1.18 Poi Mill**

Interpretation of the historic poi mill is recommended. Remnants of the concrete foundation still remain and the MPAC discussed whether the poi mill could be rebuilt in order to process harvests from the lo‘i. However, the site is located in an area of potential flood hazard due to wave action (Figure 20), and if State Parks or another entity wishes to reestablish a poi mill on site or within the park, additional studies are recommended to determine the most suitable location, design, and size for such a facility. The historic site, however, can be interpreted with signage or displays and could be included on guided tours.

#### **2.5.1.19 Cemetery Areas**

The two modern cemeteries that are just north of the loko are currently maintained by descendent family members. In the 1996 Burial Treatment Plan, there are recommendations to install signage and fence or wall off and gate the cemetery areas, with access provided to lineal descendants and State personnel. However, during the MPAC meetings a request was made to eliminate the fencing and gates. Rather than using fences or walls, landscaping and the use of native and Polynesian-introduced plants should be considered as more natural buffers for the area. Any signage that is installed should be designed with input from the families of those buried there.

### **2.5.2 HAZARD MITIGATION MEASURES**

Due to the potential for rockfalls along the highway, all of the major facilities including the ~~Interpretive Path~~ pedestrian path to Kē‘ē will be located outside of the projected high rockfall hazard zones as described by AECOM in their Rockfall Hazard Assessment report (Appendix B). These improvements should be considered part of the rockfall mitigation and prioritized in capital improvement project funding. In addition, warning signs should be installed at appropriate locations along the highway, and Safety instructions should be made available online and in ~~during~~ visitor orientation materials distributed prior to park entry, and posted at the Welcome Hale.

Ocean safety signs should ~~also~~ be posted at both the main entry points by the Welcome Pavilion/ECC/Hale as well as along the major pathways leading to shoreline areas such as at Kēʻē Beach, near the Hālau Waʻa, and at the Cultural Gathering Place. Additional safety signage should be installed as necessary throughout the park in appropriate areas.

Emergency evacuation routes will be planned and ~~shown~~ provided on maps and directional signage located at key locations at the park ~~during the visitor orientation sessions~~ as well as indicated on visitor brochures and materials provided on the website and prior to park entry and park signage. ~~The loop paths through the loʻi can be used as an emergency route between Kēʻē and the Welcome Pavilion/ECC.~~ If people need to be airlifted out of the park, the emergency helipad and landing zones shown on the plan can be accessed from multiple locations.

Additional discussion about the natural hazards and mitigation measures are discussed in Section 3.10.

### **2.5.3 INFRASTRUCTURE IMPROVEMENTS**

The following recommendations for infrastructure improvements were developed by Kennedy/Jenks Consultants to support the goals of the proposed Master Plan and preferences of the MPAC. See Section 4.7 and Appendix G and Appendix H.

#### ***2.5.3.1 Integrated Water/Wastewater/Drainage System***

The proposed Master Plan recommends installing an integrated water/wastewater/drainage system to maximize the efficiency and use of on-site water resources. It includes collecting rainwater and using treated wastewater for nonpotable water uses to minimize demand for potable water, as well as restoring the ʻauwai wherever possible and improving the drainage of surface runoff to irrigate surrounding garden areas or the loʻi if it can be appropriately filtered.

Specific design considerations for the integrated water/wastewater/drainage systems include:

- Using treated wastewater effluent and collected rainwater for irrigating the landscaping around the facilities such as the ~~ECC, picnic area, Caretaker's Cottage and baseyard~~ Montgomery House, Allerton Caretaker's Cottage, Welcome Hale, parking lot, and new restrooms. There are three levels of treated wastewater recognized by the State Department of Health (DOH) as recycled water. R-1 has the highest level of treatment and R-3 the lowest (Kennedy/Jenks 2010). The Master Plan recommends aerobic wastewater treatment to at least R-2. If the treated water quality is R-2, irrigation systems must be subsurface with no over-ground sprays. If the effluent is treated to R-1, over-ground spray and drip systems can be installed.
- Using recycled water and collected rainwater for toilet flushing at the ~~ECC, Caretaker's Cottage~~ new restrooms, Allerton Caretaker's Cottage, and Montgomery House to conserve potable water.
- Reducing the need for stream diversions by restoring the ʻauwai and collecting, storing and using rainwater.

- Using non-potable water for fire protection. Collected rainwater or even ocean water can be used for fire protection in emergencies.
- Directing rainwater runoff from the main parking to landscaped areas and rain gardens. Where possible, collecting and storing rainwater for reuse such as irrigation and possibly toilet flushing.
- Redesigning Kūhiō Highway culverts so that rainwater that passes beneath it flows more naturally and can be filtered and used in the ‘auwai system.

Control measures to prevent the spread of apple snails from the park’s lo‘i to Limahuli Stream should be included in any design or implementation of the ‘auwai and irrigation systems for the Agricultural Complex. Some suggestions include but are not limited to:

- Elevating and extending the outfall pipes from the Limahuli Stream diversions above the receiving ‘auwai so that the snails cannot crawl directly into the stream. The snails are known to dislike cold, fast-moving water, which is what flows from Limahuli Stream, and so the risk is minimized.
- Grading the ‘auwai to flow makai and away from Limahuli Stream.

For items specific to wastewater treatment:

- Treatment for wastewater should be with aerobic systems to a minimum R-2 water quality, with aeration and non-chlorine treatment such as ultraviolet (UV) disinfection to improve effluent quality. Consider using renewable energy sources to provide power.
- Locate effluent absorption beds under parking lots and driveways if permitted. DOH requires the use of aerobic treatment units certified by NSF/ANSI 245 for systems that discharge directly into the groundwater.
- Provide aeration to the existing constructed wetlands primary treatment tanks, powered by a PV system and replace the plants at the constructed wetlands to high-nutrient removing plants to improve water quality.
- For remote, low use facilities, consider composting toilets or ~~temporary/portable facilities as needed~~ innovative wastewater technologies.
- Use non-chemical disinfectants and cleaning products for maintenance, particularly in composting toilets, to minimize impacts to wastewater treatment processes and effluent quality. Use environmentally-safe soaps that contain plant nutrients and biocompatible cleaners.
- Since the proposed wastewater facilities are currently not standard according to the State Department of Health (DOH), include maintenance manuals and provide instruction to ensure proper upkeep of all wastewater systems at the park.
- As an alternative, vault systems, which are fully contained and can be pumped and treated at an off-site facility are also being considered should effluent reuse not be possible onsite.

#### **2.5.3.2 Electrical Power**

Many of the proposed facilities will require electrical power. There is currently no electrical power service at the park. Kaua‘i Island Utility Cooperative (KIUC) service stops at the entrance to the park and should be extended to the turnaround for emergency lighting if desired

at the shuttle stop. ~~Welcome Pavilion/ECC and the Caretaker's Cottage.~~ Renewable energy should be used to service the remaining electrical demand ~~and as much as possible.~~ ~~Renewable energy is encouraged with~~ Potential renewable energy resources ~~such as include~~ solar hot water heating and solar ~~electric~~ photovoltaics (PV), wind and hydro power.

Solar hot water heaters and PV electric systems are well-established technologies that have been installed widely throughout the islands. According to data from the Hawai'i Sugar Planters Association collected in 1985, an estimated 350 solar calories per square centimeter fall on the area per day ( $\text{cal}/\text{cm}^2/\text{day}$ ). The higher the intensity, the better the resource is. The average for the island is  $350 \text{ cal}/\text{cm}^2/\text{day}$ , with ranges from 0 to  $500 \text{ cal}/\text{cm}^2/\text{day}$ . A solar hot water heater can be installed at the ~~Caretaker's Cottage, the ECC, and any of the other~~ facilities that may require hot water, such as the Montgomery House and Allerton Caretaker's Cottage, once they are renovated. PV panels installed as shade structures at the shuttle stop, turnaround, restrooms, and comfort station at Kē'ē is recommended to power any new equipment needed for an upgraded wastewater treatment system.

Micro wind and micro hydropower are other sources of renewable energy that should be considered in addition to solar. There are smaller wind turbines that can be installed on rooftops at the park or those that rotate on a vertical instead of horizontal axis to minimize any impact to birds. There are also evolving wind technologies, such as the Humdinger Windbelt, developed by a Hawai'i-based company, that do not have rotating airfoils but capture energy from aeroelastic flutter (<http://www.humdingerwind.com>). As technology evolves, State Parks and DLNR should continue to look into viable alternatives as improvements are phased in and developed.

A microhydropower system needs a consistently running source of water (as little as two gallons per minute) and a relatively small elevation change (as little as two to three feet of head) to turn a turbine to create power. However, more of each will increase output. Microhydropower systems are more efficient the closer they are to the energy source and therefore Limahuli Stream, the only perennial stream at the park, could be investigated to provide a source for microhydropower. Neighboring Limahuli Gardens uses a microhydropower system to power their entire visitor center which runs on a 24V system and includes lights, a computer and cash register (Winter, personal communication 2011). Care must be taken, however, to size and locate the microhydropower to minimize impacts to the stream ecosystem and to account for periods of low stream flow. To minimize the impacts of microhydropower systems on native Hawai'i amphidromous biota, the diversion intakes must be designed to have low-velocity intakes placed subsurface in relatively deep pool in the center of the stream in order to minimize entrainment of larval or post-larval stream animals. Also, as a potential in-stream use, any microhydropower system should be integrated with a public trust use such as the taro lo'i production should it be pursued.

#### **2.5.3.3 Communications**

In order to maintain communications and provide for public safety during emergencies, the existing hardline pay phone and emergency phone at Kē'ē Beach ~~is proposed to~~ should be

maintained. For similar reasons, hardline telephone service ~~is proposed to be provided~~ should be considered at the turnaround and Welcome Hale if desired. ~~Caretaker's Cottage and Welcome Pavilion/ECC. A second pay phone or at least a closed circuit phone which connects to the Caretaker also is proposed to be located on the outside of the Welcome Pavilion/ECC so that emergency calls can be made when the ECC is closed and hikers who need assistance can contact the Caretaker.~~ The remote and mountainous location limits wireless communications. Wireless services should be considered for visitor convenience and may be required for certain parking management technologies.

#### ***2.5.3.4 Artificial Lighting***

In order to minimize impacts to Hā'ena's wildlife which can become disoriented at night by artificial lighting, the following recommendations will be followed for any lights designed for the park's facilities.

- All exterior lights will be fully-shielded (completely opaque) and downward facing full-cut off fixtures with the lowest light level (lumens) possible, sufficiently large, and positioned so that the bulb is only visible from below to minimize distraction and disorientation of wildlife flying overhead. They can also be installed lower to the ground to minimize light pollution and motion sensors and/or timers can be utilized to activate the lights only when absolutely necessary.
- Lighting plans and management plans will be carefully designed and implemented so that no light from the park is visible from the beach to minimize impacts to nesting sea turtles or their hatchlings seeking the ocean.
- The use of artificial lights should be minimized or reduced as much as possible during the seabird fledging season of September to December, and during the sea turtle hatching period July to September, and yellow lighting invisible to honu should be used near the shoreline. Night time construction should be avoided.

### **2.5.4 KEY MANAGEMENT RECOMMENDATIONS**

The following key management recommendations and principles ~~may help~~ will be followed to balance continued public and recreational use with the protection of the cultural, natural, and historic resources at the park.

#### ***2.5.4.1 Adaptive Management***

The HSPCAC recommended that adaptive management be the primary management concept adopted at the park given the diverse and passionate feedback received from the community. This will allow State Parks to make adjustments as they implement various management actions and learn what the impacts are. The U.S. Department of the Interior describes adaptive management as "an iterative learning process producing improved understanding and improved management over time. ... It is not a 'trial and error' process, ... but rather a means to more effective decisions and enhanced benefits. Its true measure is in how well it helps meet environmental, social and economic goals, increases scientific knowledge, and reduces tensions among stakeholders" (Williams et al, 2009).

Due to the complexity of the park environment, uncertainty of outcomes given potential changes in management strategies, and the active community, adaptive management provides a methodology State Parks can follow in order to improve resource management decisions while addressing community concerns. As noted in the technical guide,

Often the uncertainty about management impacts is expressed as disagreements among stakeholders who have differing views about the direction and magnitude of resource change in response to management. An adaptive approach explicitly articulates these viewpoints, incorporates them into the decision making process, and uses management itself to help identify the most appropriate view about resource dynamics. In this way, understanding of the resource can be enhanced over time, and management can improve. ... Management of problems like these increasingly involves a systems approach with explicit and agreed-upon objectives, management alternatives, and analytical approaches that can identify the most appropriate management strategies. (Williams et al, 2009)

The technical guide provides the following list of activities that can assist with adaptive management strategies if performed in a structured approach:

- Engaging the relevant stakeholders in the decision making process
- Identifying the problem to be addressed
- Specifying objectives and tradeoffs that capture the values of the stakeholders
- Identifying the range of decision alternatives from which actions are to be selected
- Specifying assumptions about resource structures and functions
- Projecting the consequences of alternative actions
- Identifying key uncertainties
- Measuring risk tolerance for potential consequences of decisions
- Accounting for future impacts of present decisions
- Accounting for legal guidelines and constraints

#### ***2.5.4.2 Cultural and Community Advisory Group***

A Cultural Advisory Group (CAG) ~~should~~will be established to advise State Parks on ongoing improvements, educational and interpretive materials, and cultural matters regarding the park. State Parks may also consult the CAG as needed for proposed management actions and proposed construction projects as well as interpretive programs and ~~devices~~tools. The CAG may be composed of representatives from the original Hā'ena families, as well as those persons who specifically lived in, worked, or cared for the lands within the park boundaries, and those who have relatives buried within the park. It should also include cultural practitioners with knowledge specific to hula, Ke Ahu a Laka and Ka Ulu a Paoa, fishing, and other cultural practices specific to Hā'ena. Draft recommendations for the establishment and responsibilities of the CAG are contained in the Master Plan report. They ~~may~~should be viewed as a starting point for developing the CAG and are subject to change.

~~The MPAC also believes a broader community advisory group comprised of diverse community representatives such as the MPAC can provide ongoing support and consultation on general park issues as the Master Plan is implemented. This group could be created by combining the CAG with additional members from the community. The MPAC recommends the larger group meet regularly, at least once a year, with State Parks and any future park~~

~~management entity if established. Organization and membership of such a group is yet to be determined. Should any current MPAC members be willing to continue assisting State Parks on an advisory basis, they would be welcomed.~~

Separate from the CAG, the broader community advisory group, the Hā‘ena State Park Community Advisory Committee, or HSPCAC, has been established and will provide ongoing support and consultation on general park issues including the implementation of the master plan. The group has adopted a charter and plans to meet regularly, particularly when State Parks or the future management entity undertake any improvement projects or changes in park policy.

#### **2.5.4.3 Visitor Limits**

Visitor counts at the park have risen significantly over the past twenty years. Table 3 summarizes various visitor counts taken at the park since 1993. The most recent counts were taken in the summer months and show that there are roughly 2,000 people who enter the park on a daily basis.

**TABLE 1: SUMMARY TABLE OF DAILY VISITOR COUNTS**

| YEAR | MONTH/<br>SEASON | DAY OF<br>THE<br>WEEK | VISITORS<br>PER DAY | SOURCE                                  | NOTES                                                                                                       |
|------|------------------|-----------------------|---------------------|-----------------------------------------|-------------------------------------------------------------------------------------------------------------|
| 1993 | Off-peak         |                       | 50<br>(average)     | The Keith Companies<br>2001             |                                                                                                             |
| 1993 | August           |                       | 353<br>(average)    | The Keith Companies<br>2001             |                                                                                                             |
| 1998 | September        | Friday                | 1,501               | DLNR State Parks                        |                                                                                                             |
| 1999 |                  |                       | 1,700               | DLNR via Stepath 2006                   |                                                                                                             |
| 2008 | August           | Holiday<br>weekend    | 1,950 (est.)        | ATA 2011                                | Estimated based on 2.5<br>persons per vehicle                                                               |

Currently, there are no visitor limits at the park. Many on the MPAC and in the community felt the current number of visitors is far too many and a limit should be set on the number of visitors to reduce impacts to the natural, cultural and scenic resources and to improve the overall visitor experience.

~~In response, State Parks plans to institute a daily visitor limit as part of the preferred plan. Initially, the number of people in the park would be limited to 900 people per day, which is less than half the number of daily visitors that typically enter the park during the summer months. State Parks may adjust the number over time depending on future improvements,~~

~~improved/increased maintenance, and/or other studies such as impact studies, particularly if harmful impacts to the natural, cultural and archaeological resources occur.~~

~~The daily visitor limit does not include cultural practitioners, special user groups such as hālau, lo‘i workgroups, cemetery caretakers, or school groups. It also does not include the 60 hikers who obtain valid camping permits for the Kalalau Trail or the 30 hunters who obtain valid hunting permits for the Nāpali Coast State Wilderness Park Hunting Unit G.~~

In addition to these recommendations, because of the extensive archaeological, natural and cultural resources at the park, State Parks is proposing to limit the number of people in the park to 900 people per day on average during the peak hours of park use. The initial hours over which this limit would be applied are 7:30 AM to 5:30 PM, but are subject to change. This number is an initial visitor limit which State Parks may adjust over time depending on future improvements, improved/increased maintenance, and/or other studies such as impact studies, particularly if harmful impacts to the natural, cultural, and archaeological resources arise. The daily visitor counts will be averaged over the course of a month so adjustments can be made for park closure days and is therefore a soft limit that can be adjusted as needed on a daily basis.

This initial visitor limit is higher than what was recommended by the MPAC because it includes day hikers on the Kalalau Trail who numbered well over 500 in 2009. Because the trailhead is located within the park, visitors venturing on the trail are anticipated to use the park’s restroom facilities, often go swimming, and use the showers when they return from hiking on the trail. However, they are not impacting the park while on the trail. The visitor limit also does not include the hikers with valid camping permits or the hunters with valid hunting permits for the Nāpali Coast State Wilderness Park Hunting Unit G since they are not expected to be in the park using the facilities for very long and additional facilities are available at Hanakoa and Kalalau. The daily visitor limit also would not include cultural practitioners, or special user groups such as hālau, lo‘i workgroups, cemetery caretakers, or school groups.

By instituting a daily visitor limit, this will encourage visitors to plan ahead and an informational system via the internet, text messages, and email could be developed to distribute real-time information on park access, entry ticket availability during managed visitor hours, special events, and weather, ocean and any hazardous conditions at the park. Park managers will also be able to better manage park operation and resource impacts. In addition, they are able to anticipate how busy the park will be on any given day and post notices online or distribute updates to the visitor industry early in the day whether entry tickets will be available during the managed visitor hours. This could also help reduce casual drop-ins and general traffic along the highway through neighboring North Shore communities. Prior to instituting the proposed visitor limits, a public information campaign must be made far in advance so people are able to plan their visit to the park. State Parks acknowledges that park access will be an ever-evolving operational issue and will likely change over time as new policies are implemented. However, the goal is to study the impacts of these proposed policies and to adjust them as appropriate to improve the long-term management of the park and visitor satisfaction.

#### ***2.5.4.4 Required Staff/Volunteer Education***

As representatives for the park, all park staff as well as volunteers should be trained and be knowledgeable on the cultural, historic, scenic and natural resources at the park. They should also be well-versed on park rules, potential hazards, safety training and emergency evacuation processes, and proper protocol at cultural sites.

#### ***2.5.4.5 Required Visitor Orientation Prior to Park Entry***

~~It is also proposed that all visitors attend an educational session upon entering the park similar to the Hanauma Bay Nature Preserve on O‘ahu. The sessions would be held at the Welcome Pavilion in the near term and at the ECC once built. All visitors will be provided with park rules and information prior to entering the park. The visitor orientation could be made available on the State Parks website, sent via text or email, and tied to ticket distribution, particularly if advanced reservations become a requirement in the future. The orientation session could be a short online video that would educate visitors on appropriate recreational activities and behavior, safety precautions as well as sensitivity to natural and cultural resources and to cultural activities that may be occurring in the park. It should also include~~ In addition, texts or emails could be sent to park visitors prior to entry to inform them of safety precautions and updates on any special events or weather conditions. Similar orientation information should be posted at the Welcome Hale. The CAG should be consulted on appropriate cultural information to be included in the orientation session.

~~Once visitors complete the orientation session, they would not need to attend on subsequent visits to the park for a full calendar year as long as they register upon entry. Registration and orientation attendance could also be tracked and tied to annual passes, if administered. These orientation sessions could be held at the proposed Welcome Pavilion/Education and Cultural Center or even a temporary facility at the park entry.~~

## PARK ENTRY

### ***2.5.1.1 Park Entry, Turnaround, and New Main Gate***

A new vehicle gate is recommended to be installed at the park entry when the highway is transferred to State Parks. Only those with special access to Kēʻē, such as the lifeguards and rescue personnel, those with valid ADA parking placards or plates, park staff, the Hula Complex and other cultural practitioners, will be allowed to drive along the former highway as needed to reduce visitor exposure to the rockfall hazards. It will have a separate entry off the turnaround. Rockfall hazard warning signs will be installed on the gate across the highway and a swing gate on the mauka half of the right-of-way could be automated to open for exiting traffic only. The design of the gate will be open and remain low in height to minimize the visual impact towards Kēʻē.

A vehicle turnaround is provided just past the park entry and provides separate accesses to and from the main parking lot, as well as the special access parking at Kēʻē, and a separate staging area that could be used for various park purposes. The turnaround is designed to include the shuttle stop and/or bus stop if/when such services become available and allow those dropping off visitors to pull over at the curb without blocking traffic. Shade structures are also provided to shelter those waiting at the visitor drop-off and pick-up areas. Shuttle and bus schedules should be posted at the stop if they are established. Should shuttle or transit service to the park become successful enough to eliminate or reduce the need for the parking lot, the shuttle stop area can be enlarged to accommodate the required passenger drop offs and pick-ups. The shade structures could also be designed with photovoltaic panels to help power the nearby facilities.

# PARKING

## **2.5.1.2 Parking**

Most of the visitor parking will be consolidated into one main visitor parking lot near the park entry as much of the highway will be closed to general traffic. Only a small special access parking area will remain at Kē'ē as noted earlier for ADA accessibility, the lifeguards, park staff, the Hula Complex and other cultural practices. It will also be accessible for emergencies as well as safety and rescue operations.

The preferred medium for the parking lot is permeable pavement or structural grass over the entire parking lot or at least half of the parking lot so it can be used for multiple purposes. The parking lot as shown in the plan is large enough to accommodate roughly 100 vehicles. However, to encourage the use of a shuttle or transit system being planned for the North Shore, the number of available stalls may be reduced as appropriate and the grassed areas around the parking lot can be used for outdoor activities, staging areas, or educational purposes related to the adjacent traditional house site and lo'i. Eventually, if the shuttle or transit system proves successful, the areas no longer needed for parking could permanently be converted into an expanded shuttle stop area or other park uses. In the interim, the areas shown in different shades of green in Figure 1 show how the parking lot could be partitioned for different users, whether they are fee-paying visitors or non-fee paying visitors, and can be adjusted with movable bollards and cordons depending on the number of cars for each user group. The division between the two can be adaptively managed weekly, daily, or even hourly throughout the day depending on demand. This design gives State Parks the flexibility to provide enough parking until the shuttle/transit system is operational and to adjust as needed the number of parking stalls that are available for the different user groups while also encouraging multimodal access to the park.

Pedestrian paths should be provided throughout the parking lot and drop-off/pick up areas to clearly delineate safe places where people should walk and direct visitors towards the park entry. The pedestrian paths could be curbed or edged for easier maintenance and should be surfaced with permeable pavers or pavements or natural soil hardeners to increase rainwater infiltration while providing a stable, weatherproof surface. If electric vehicle parking and charging stations are provided, they must comply with the State Disability and Communications Access Board (DCAB) Interpretive Opinion 2012-01, which states, 'Where EV charging stations are provided, 5%, but not less than one of each type of EV station shall be accessible.

At the special access parking area, bicycle racks should also be installed and drainage improvements should be made in the area to prevent ponding, soil erosion, and beach washouts as has happened at Kē'ē during heavy rainfall events. It is also recommended that access to this special access parking area be managed by special permit or access codes at a controlled entry off the turnaround. Access should also be coordinated with safety and rescue personnel during emergencies and rescue operations.

### 4.3.2 PARKING

#### *Existing Conditions*

Within the park, there are two designated parking areas, one approximately 800 feet from the park entrance and one at the terminus of the highway near Kē‘ē Beach. The parking lot nearest the park entrance is unpaved and measures approximately 30,000 square feet in area, it is unsigned and unstriped. In the absence of striping, visitor parking patterns are informal and at times inefficient. During wet weather conditions the dirt/gravel surface becomes muddy and deeply grooved from vehicle maneuvering. As the parking surface dries, the grooved mud becomes hard packed ruts creating an uneven surface that further reduces the area available for parking.

The parking area near Kē‘ē beach is hard-packed dirt on each side of the highway. Two ADA accessible spaces are paved, striped and signed.

ATA also noted the considerable amount of vehicles that were parked alongside the highway within the park leading to Kē‘ē, many illegally parked despite the posted “no parking” signs. Visitors who park along the roadway or park in the lot closer to the entrance were exposed to oncoming traffic due to a lack of pedestrian sidewalks.

#### *Potential Impacts and Mitigation Measures*

The Master Plan recommends closing the highway within the park to general through traffic which will effectively eliminate the illegal parking that currently occurs along the highway. Parking will be simplified and better organized by limiting it to two lots; the main one at the entrance and the special access parking lot at Kē‘ē. The turnaround at the entrance will also keep traffic moving rather than allowing drivers to idle or requiring a multi-point turn to turnaround should the parking area be full. This should ease congestion and backups along the highway approaching the park and reduce the potential for conflicts between vehicles and pedestrians.

The main parking area is proposed to be surfaced with pervious paving material or structured grass that is ADA accessible over the entire parking lot or at least half of the parking lot so it can be used for multiple purposes and can be striped to create an efficient parking layout. Beneficial impacts are expected to include more orderly and efficient use of the parking area, an improved driving surface, and a reduction in sediment runoff. Bioswales around the parking area are also proposed to capture and help filter runoff. Methods for stormwater systems will be integrated with the overall water/wastewater/drainage system designed for the park as well as investigation of whether the ‘auwai can be restored or not. The area between the parking lot and the highway should be designed to provide rockfall catchment as recommended in the Master Plan as well as drainage and ‘auwai restoration as appropriate. Therefore, the design of the main parking lot should be coordinated with the design of the entry facilities and based on sustainability, cost, and availability of materials/technology.

The parking lot as shown in the Master Plan is large enough to park roughly 100 vehicles. However, to encourage use of the shuttle or transit system being planned for the North Shore, the number of available stalls may be reduced and the grassed areas of the lot can be used for outdoor activities, staging areas, lo'i, or educational purposes. The area shaded in a darker green in the plans shows how the parking lot could be partitioned for the different uses park users, whether they are fee-paying visitors or non-fee paying visitors, and can be adjusted with movable bollards and cordons depending on the number of cars for each user group. The division between the two can be adaptively managed weekly, daily, or even hourly throughout the day depending on demand. This design gives State Parks the flexibility to provide enough parking until the shuttle/transit system is operational and to adjust as needed the number of parking stalls that are available for the different user groups while also encouraging multimodal access to the park. Overnight parking could also be reduced or restricted and parking lot time limits could be proposed as needed to encourage turnover of the stalls. If the transit system proves successful once implemented, the areas ~~may~~ no longer ~~be~~ needed for parking ~~and~~ could permanently be converted into an expanded shuttle stop area or other park uses such as additional educational gardens and picnic areas, event space with a grand entry lawn, or expanded staging areas.

The beneficial impacts of removing the illegal parking include fewer cars parked within rockfall hazard areas, elimination of vehicles from scenic views such as Wai a Kanaloa and Kē'ē Lagoon, the reduction of wear and erosion along the highway, and the reduction of car fluids seeping into the ground particularly near sensitive cultural and natural resources. The potential negative impacts of removing the illegal parking include an increased demand for legal parking spaces within the park, the potential displacement of parking to the highway or other areas and communities outside the park (also illegal), increased visitor use at Hā'ena Beach Park and other nearby coastal resources, and driver frustration at the park entry for those who do not plan ahead and check parking availability prior to driving to the park in the event parking is not available when they arrive. However, the reduction in the number of visitors ~~permitted~~ at the park on average during peak hours will serve to reduce the overall demand for parking and it is recommended that State Parks or the future management entity institute public information processes to inform visitors ahead of time whether parking is available or not. This can be done via social media, text messages and emails, the State Parks webpage, and daily information disseminated to the visitor industry and media outlets. The limited parking will also force visitors to plan their trips to Hā'ena ahead of time and may encourage visitors to use a shuttle, if available.

When visitors plan ahead, park managers will be better able to anticipate park operation needs and potential resource impacts. In addition, it could help reduce the number of drop-ins at the park and reduce general traffic along the highway through neighboring North Shore communities. Prior to instituting the proposed visitor limits, a public information campaign must be made far in advance so people are able to prepare for the changes proposed to the park.

## WELCOME HALE

### **2.5.1.3 Welcome Hale and Restrooms**

The Welcome Hale is envisioned as an open pavilion without walls where information about the park can be posted. The displays should include a park map and orientation information, park rules and cultural protocols. Daily weather, ocean and hazard conditions could also be posted at the Welcome Hale.

New public restrooms and bicycle parking are provided outside of the hale near the main parking lot. This second set of restrooms will help reduce the use of the Kē'ē comfort station, which is located near sensitive archaeological sites. Technological advances in individual wastewater treatment systems are providing higher-quality effluents and should be considered when designing the new restrooms. If possible, the effluent should be reused and the leach field for the new restrooms could be located beneath the parking lot. Dual waterlines and rainwater catchment systems can also be installed for the restrooms and the lo'i to minimize potable water use. Solar photovoltaic systems can also be installed to support electrical needs.

## PEDESTRIAN PATH

### **2.5.1.4 Pedestrian Path**

Due to the potential for rockfall hazards along the highway, a pedestrian path will be provided makai of the highway, connecting the Welcome Hale to Kēʻē Beach. It will traverse the loʻi along the first berm separating the first two rows of loʻi and then turn north to avoid the wetlands. It will cross an ʻauwai over a footbridge and connect to a path through the hau tunnel. This path will then connect to the trail behind the dunes and turn south, leading visitors past the comfort stations and lifeguard tower to Kēʻē. The path will remain low to the ground but just above the berm, with structural supports located to avoid any archaeological sites. Handrails or path edging will be provided for safety if needed. It should also be designed with lightweight, durable, and easy-to-maintain materials that are resistant to vandalism and weathering.

Interpretive displays and wayside exhibits will be installed along this path, including directional signage and educational information for the varied sights along this trail. From here, distant views of Wai a Kanaloa can be seen as well as spectacular views of Makana, the loʻi, loko and the wetlands.

## LIMITED ACCESS CORRIDOR

### ***2.5.1.8 Limited Access Corridor***

The highway between the turnaround and Kē‘ē will be closed to general vehicle traffic and used only for special vehicle access due to the potential rockfall hazard. The only vehicles that will be permitted beyond the gate will be special access vehicles such as the lifeguards and emergency and rescue teams, park staff, hula and other cultural practitioners, and ADA vehicles. Because this segment of the highway is currently owned by the State Department of Transportation, it will need to be transferred to State Parks or an agreement must be made between the two state agencies for State Parks to take over management of it. In emergency situations such as tsunami warnings, visitors will be able to evacuate along this corridor to escape to higher ground and out of the park if it is deemed safe.

## AGRICULTURAL COMPLEX

### 2.5.1.15 Agricultural Complex

In order to create a living cultural agricultural complex, it is recommended that community gardening practices continue the restoration of the lo'i as recommended in the restoration plans already in place. One request of the MPAC was to allow for other cultural crops to be planted in addition to kalo. Historically, the complex was known to be flexible; water was redirected to allow certain areas to be used for dryland cultivation. 'Uala, or sweet potatoes, were known to be grown in sandy areas and mai'a (bananas), kō (sugar cane), and 'awa (*Piper methysticum*) were grown in the valleys.

Restoration of the 'auwai is also recommended wherever feasible, particularly in actively cultivated areas of the lo'i. Special care, however, needs to be taken not to hydraulically connect the lo'i and 'auwai back to Limahuli Stream to prevent the spread of apple snails. Limahuli Stream is one of the few places in the state that does not have apple snails and the snails are currently in the park's lo'i.

The 2001 Draft Park Plan also included pedestrian and bicycle pathways throughout the lo'i, primarily along and sometimes through the 'auwai. This is no longer recommended since the goal is to reestablish the 'auwai as the primary means of irrigating the lo'i. The plan currently locates the main pedestrian path over the first berm within the lo'i and will provide visitors a close-up view of the lo'i on their way to Kē'ē. There may also be opportunities for interactive educational activities within the first row of lo'i for visitors, away from the Hui's restoration work, which will continue makai and east.

Access to and/or through certain areas of the lo'i is required for both people and equipment as a part of ongoing maintenance and harvesting. For safety reasons, access within the working lo'i should therefore be managed and primarily reserved for those restoring the lo'i as well as for educational and work groups tending to the lo'i.

# ADAPTIVE MANAGEMENT

## **2.5.4.1 Adaptive Management**

The HSPCAC recommended that adaptive management be the primary management concept adopted at the park given the diverse and passionate feedback received from the community. This will allow State Parks to make adjustments as they implement various management actions and learn what the impacts are. The U.S. Department of the Interior describes adaptive management as "an iterative learning process producing improved understanding and improved management over time. ...It is not a 'trial and error' process, ... but rather a means to more effective decisions and enhanced benefits. Its true measure is in how well it helps meet environmental, social and economic goals, increases scientific knowledge, and reduces tensions among stakeholders" (Williams et al, 2009).

Due to the complexity of the park environment, uncertainty of outcomes given potential changes in management strategies, and the active community, adaptive management provides a methodology State Parks can follow in order to improve resource management decisions while addressing community concerns. As noted in the technical guide,

Often the uncertainty about management impacts is expressed as disagreements among stakeholders who have differing views about the direction and magnitude of resource change in response to management. An adaptive approach explicitly articulates these viewpoints, incorporates them into the decision making process, and uses management itself to help identify the most appropriate view about resource dynamics. In this way, understanding of the resource can be enhanced over time, and management can improve. ... Management of problems like these increasingly involves a systems approach with explicit and agreed-upon objectives, management alternatives, and analytical approaches that can identify the most appropriate management strategies. (Williams et al, 2009)

The technical guide provides the following list of activities that can assist with adaptive management strategies if performed in a structured approach:

- Engaging the relevant stakeholders in the decision making process
- Identifying the problem to be addressed
- Specifying objectives and tradeoffs that capture the values of the stakeholders
- Identifying the range of decision alternatives from which actions are to be selected
- Specifying assumptions about resource structures and functions
- Projecting the consequences of alternative actions
- Identifying key uncertainties
- Measuring risk tolerance for potential consequences of decisions
- Accounting for future impacts of present decisions
- Accounting for legal guidelines and constraints

## CULTURAL AND COMMUNITY ADVISORY GROUP

### *2.5.4.2 Cultural and Community Advisory Group*

A Cultural Advisory Group (CAG) ~~should~~will be established to advise State Parks on ongoing improvements, educational and interpretive materials, and cultural matters regarding the park. State Parks may also consult the CAG as needed for proposed management actions and proposed construction projects as well as interpretive programs and ~~devices~~tools. The CAG may be composed of representatives from the original Hā'ena families, as well as those persons who specifically lived in, worked, or cared for the lands within the park boundaries, and those who have relatives buried within the park. It should also include cultural practitioners with knowledge specific to hula, Ke Ahu a Laka and Ka Ulu a Paoa, fishing, and other cultural practices specific to Hā'ena. Draft recommendations for the establishment and responsibilities of the CAG are contained in the Master Plan report. They ~~may~~should be viewed as a starting point for developing the CAG and are subject to change.

~~The MPAC also believes a broader community advisory group comprised of diverse community representatives such as the MPAC can provide ongoing support and consultation on general park issues as the Master Plan is implemented. This group could be created by combining the CAG with additional members from the community. The MPAC recommends the larger group meet regularly, at least once a year, with State Parks and any future park management entity if established. Organization and membership of such a group is yet to be determined. Should any current MPAC members be willing to continue assisting State Parks on an advisory basis, they would be welcomed.~~

Separate from the CAG, the broader community advisory group, the Hā'ena State Park Community Advisory Committee, or HSPCAC, has been established and will provide ongoing support and consultation on general park issues including the implementation of the master plan. The group has adopted a charter and plans to meet regularly, particularly when State Parks or the future management entity undertake any improvement projects or changes in park policy.

## VISITOR LIMITS

### 2.5.4.3 Visitor Limits

Visitor counts at the park have risen significantly over the past twenty years. Table 3 summarizes various visitor counts taken at the park since 1993. The most recent counts were taken in the summer months and show that there are roughly 2,000 people who enter the park on a daily basis.

**TABLE 1: SUMMARY TABLE OF DAILY VISITOR COUNTS**

| YEAR | MONTH/<br>SEASON | DAY OF<br>THE<br>WEEK | VISITORS<br>PER DAY | SOURCE                                  | NOTES                                                                                                       |
|------|------------------|-----------------------|---------------------|-----------------------------------------|-------------------------------------------------------------------------------------------------------------|

Currently, there are no visitor limits at the park. Many on the MPAC and in the community felt the current number of visitors is far too many and a limit should be set on the number of visitors to reduce impacts to the natural, cultural and scenic resources and to improve the overall visitor experience.

~~In response, State Parks plans to institute a daily visitor limit as part of the preferred plan. Initially, the number of people in the park would be limited to 900 people per day, which is less than half the number of daily visitors that typically enter the park during the summer months. State Parks may adjust the number over time depending on future improvements, improved/increased maintenance, and/or other studies such as impact studies, particularly if harmful impacts to the natural, cultural and archaeological resources occur.~~

~~The daily visitor limit does not include cultural practitioners, special user groups such as hālau, lo‘i workgroups, cemetery caretakers, or school groups. It also does not include the 60 hikers who obtain valid camping permits for the Kalalau Trail or the 30 hunters who obtain valid hunting permits for the Nāpali Coast State Wilderness Park Hunting Unit G.~~

In addition to these recommendations, because of the extensive archaeological, natural and cultural resources at the park, State Parks is proposing to limit the number of people in the park to 900 people per day on average during the peak hours of park use. The initial hours over which this limit would be applied are 7:30 AM to 5:30 PM, but are subject to change. This number is an initial visitor limit which State Parks may adjust over time depending on future improvements, improved/increased maintenance, and/or other studies such as impact studies, particularly if harmful impacts to the natural, cultural, and archaeological resources arise. The daily visitor counts will be averaged over the course of a month so adjustments can be made for park closure days and is therefore a soft limit that can be adjusted as needed on a daily basis.

This initial visitor limit is higher than what was recommended by the MPAC because it includes day hikers on the Kalalau Trail who numbered well over 500 in 2009. Because the trailhead is located within the park, visitors venturing on the trail are anticipated to use the park's restroom facilities, often go swimming, and use the showers when they return from hiking on the trail. However, they are not impacting the park while on the trail. The visitor limit also does not include the hikers with valid camping permits or the hunters with valid hunting permits for the Nāpali Coast State Wilderness Park Hunting Unit G since they are not expected to be in the park using the facilities for very long and additional facilities are available at Hanakoa and Kalalau. The daily visitor limit also would not include cultural practitioners, or special user groups such as hālau, lo'i workgroups, cemetery caretakers, or school groups.

By instituting a daily visitor limit, this will encourage visitors to plan ahead and an informational system via the internet, text messages, and email could be developed to distribute real-time information on park access, entry ticket availability during managed visitor hours, special events, and weather, ocean and any hazardous conditions at the park. Park managers will also be able to better manage park operation and resource impacts. In addition, they are able to anticipate how busy the park will be on any given day and post notices online or distribute updates to the visitor industry early in the day whether entry tickets will be available during the managed visitor hours. This could also help reduce casual drop-ins and general traffic along the highway through neighboring North Shore communities. Prior to instituting the proposed visitor limits, a public information campaign must be made far in advance so people are able to plan their visit to the park. State Parks acknowledges that park access will be an ever-evolving operational issue and will likely change over time as new policies are implemented. However, the goal is to study the impacts of these proposed policies and to adjust them as appropriate to improve the long-term management of the park and visitor satisfaction.

## VISITOR ORIENTATION

### ***2.5.4.5 Required Visitor Orientation Prior to Park Entry***

~~It is also proposed that all visitors attend an educational session upon entering the park similar to the Hanauma Bay Nature Preserve on O'ahu. The sessions would be held at the Welcome Pavilion in the near term and at the ECC once built. All visitors will be provided with park rules and information prior to entering the park. The visitor orientation could be made available on the State Parks website, sent via text or email, and tied to ticket distribution, particularly if advanced reservations become a requirement in the future. The orientation session could be a short online video that would educate visitors on appropriate recreational activities and behavior, safety precautions as well as sensitivity to natural and cultural resources and to cultural activities that may be occurring in the park. It should also include~~ In addition, texts or emails could be sent to park visitors prior to entry to inform them of safety precautions and updates on any special events or weather conditions. Similar orientation information should be posted at the Welcome Hale. The CAG should be consulted on appropriate cultural information to be included in the orientation session.

~~Once visitors complete the orientation session, they would not need to attend on subsequent visits to the park for a full calendar year as long as they register upon entry. Registration and orientation attendance could also be tracked and tied to annual passes, if administered. These orientation sessions could be held at the proposed Welcome Pavilion/Education and Cultural Center or even a temporary facility at the park entry.~~

# ROCKFALL HAZARD

## 3.10.5 ROCKFALL HAZARD

A Rockfall Hazard Assessment was performed by AECOM during the months of August and September, 2008 and updated in 2013 with a supplemental rockfall analysis and computer simulation in the area between the main parking lot and Wai a Kanaloa. The assessment, attached in its entirety as Appendix B, included a geological survey of the site and rockfall hazard identification which included a visual assessment and preparation of a geological report, locating rock outcroppings with GPS readings, and color photography. The Assessment also included an engineering planning study of the rockfall condition, development of preliminary rockfall protection design options, and cost estimates. A summary of their findings is presented graphically in Figure 22.

To evaluate rockfall risk, AECOM utilized the U.S. DOT Federal Highway Administration Rockfall Hazard Rating System methods and guidelines. This rating system evaluates a number of criteria including: slope height, ditch effectiveness, structural conditions, rock friction, erosion rates, volume of rockfall events, climate and presence of water on slope, rockfall history and slope topography. It uses a three-class rating system for hazardous conditions based on its potential to impact adjacent properties.

- **Class A** – high estimated potential for rockfall on adjacent properties with high historical rockfall activity. Chances for rockfall is moderate to high and when rockfalls occur, they will more than likely reach adjacent properties.
- **Class B** – moderate estimated potential for a rock to fall on adjacent properties with moderate historical rockfall activity. Class B rating indicates that although a rockfall is probable, the chances of it reaching adjacent properties are low to moderate. This could involve scenarios where risk is mitigated by the presence of catchment ditches or large flat areas that can contain rockfalls.
- **Class C** – low to no estimated potential for rockfall on adjacent properties with low historical rockfall activity.

AECOM also analyzed the chance of rockfall. This is primarily based on the stability of the rock face and condition of the supporting materials. There are four categories:

- **Category 1** – imminent potential for rockfall (could happen anytime)
- **Category 2** – short term potential for rockfall (within several to a dozen years)
- **Category 3** – medium term potential for rockfall (within dozens of years)
- **Category 4** – long term potential for rockfall (up to or more than a hundred years)

Please note that the time scale references are used symbolically and are not meant to represent an actual timeframe within which the rockfall events may occur.

AECOM used computer simulation to model rockfall events along five transects within the park. They determined that the rockfall hazard conditions at Hā'ena State Park consists of both Class A and Class B rockfall ratings based on the potential for rockfalls to reach the highway

at various positions as well as at Kēʻē Beach and the Kalalau Trailhead. See Figure 22. The area around Wai a Kanaloa is the most hazardous rockfall area (Class A) because: 1) many rockfall features exist here; 2) the very high probability for rockfalls to reach the highway and Wai a Kanaloa; and 3) the almost constant presence of visitors. Rockfalls are less likely to reach the highway or beach at the other areas (Class B). AECOM also analyzed the chance of rockfall at specific locations within the park which are also shown on Figure 22. They range from Category 1 through 3. AECOM performed supplemental analysis in the area between the main parking lot and Wai a Kanaloa to help guide the design of the proposed park Master Plan. Using computer modeling, they provided a baseline estimate of how far simulated rockfalls would reach. The 0% and 5% chance of simulated rockfall lines were determined based on computer modeling and then used to help locate all major facilities outside of the rockfall zones. The approximate location of these lines are also shown on Figure 22 in green and red, respectively.

### ***Potential Impacts and Mitigation Measures***

The health and safety impacts of rockfalls are proposed to be mitigated by siting all of the major visitor facilities and paths, including the Interpretive Pedestrian Path to Kēʻē, Welcome Hale, and main parking lot outside of the 0% chance of modeled rockfalls as mapped by AECOM in their Rockfall Hazard Assessment report (Appendix B). Specifically, these improvements along with the Welcome Pavilion/ECC, Interpretive Path, proposed highway closure to through traffic and installation of warning with signage and gates, and the main parking lot/shuttle improvements should be considered elements of rockfall mitigation and therefore prioritized in capital improvement project funding as they will shift the park's major visitor traffic away from the area of potential rockfall hazard. In addition, warning signs should be installed at appropriate locations at both ends of the highway and between the turnaround and Kēʻē. Safety warnings information should also be given ~~during the visitor orientation session as part of the visitor orientation materials~~ prior to park entry. The only vehicles that will be permitted on the highway to Kēʻē beyond the gate will be special access vehicles such as the lifeguards, hula practitioners, lawaiʻa and hunters, family caretakers of the cemeteries, and vehicles with the appropriate ADA placard to minimize the public's exposure to rockfall hazards. A dense native tree screen is also recommended along Kūhiō Highway, especially near the main parking lot, as trees may serve to catch or slow smaller rockfall events. Thus, general tree removal north of the highway is also not proposed unless the tree itself poses a hazard. The Master Plan elements also include features to restrict the public from standing immediately in front of the wet cave, Wai a Kanaloa, where the cliffs above are identified as Class A hazards should they choose to traverse the highway despite the rockfall warnings. Native and Polynesian-introduced landscaping are recommended as aesthetic and culturally appropriate screens for the safety devices or barriers.

## ROADWAYS AND TRAFFIC

### 4.3.1 ROADWAYS AND TRAFFIC

#### *Existing Roadway Conditions*

Public vehicular access to Hā'ena State Park is limited to Kūhiō Highway (State Highway 560), which runs the length of the park and terminates at Kē'ē Beach. The highway is owned and managed by the State DOT and consists of two paved twelve-foot lanes. Approaching Hā'ena State Park, the highway has gravel and asphalt concrete pavement shoulders. The highway enters into the park over Limahuli stream by a single lane, 10-foot wide by 12-foot long concrete bridge. Within the park, the highway becomes two lanes again and measures approximately 24 feet in width. The pavement structure is unknown.

The North Shore section of the highway is listed on the National Register of Historic Places, including the segment that leads up to and enters the park. It is the only remnant of the Belt Highway system on Kaua'i to retain a high degree of integrity (Duensing 2003). However, paved shoulder lanes were installed along the highway within the park in 1985 and in 2002 guardrails were added (Kennedy/Jenks 2011). The shoulders are often used for illegal parking, particularly in areas around Wai a Kanaloa and closer to Kē'ē.

The narrow lanes and one-lane stream crossings give the highway its unique and scenic character. The narrowness and weight limits of these bridges also eliminates the passage of large tour buses and trucks through this portion of the North Shore. Passenger vehicles are limited to a 15-20-person maximum and the vehicle weight limits for the bridges range between 16,000 and 50,000 pounds (gross vehicular weight) according to the State DOT (DOT personal communication 2011). However, these are not the tested strengths of these historic bridges and it could be far less in reality. A typical 15-passenger van has a gross weight limit (includes passengers and load) of 10,000 pounds (Austin Tsutsumi and Associates 2011).

The highway within the park has no pedestrian or bicycle amenities. Narrow shoulders on both sides of the highway often require pedestrians and bicyclists to traverse the vehicle travel lanes, creating potential conflict points. Pervasive illegal parking occurs along both sides of Kūhiō Highway within the park, despite the posted "no parking" signs. Cars park on the narrow shoulders, further blocking passage of pedestrians and bicyclists as well as narrowing the travel lanes for vehicles.

Unpaved access roads exist within the park, including the coastal beach road which runs behind the sand dunes and is gated at Kē'ē. There are also unpaved access roads to the Montgomery House, to the cleared lo'i (Phase I), and the driveway/access road to the former Allerton property. All of these roads are gated or chained along the highway.

#### *Existing Traffic Conditions*

Access to Hā'ena State Park is dominated by the personal vehicle, whether rented or privately owned. According to a 2007 OmniTrak survey of 283 park users performed for the Hawai'i Tourism Authority (HTA), 69 percent of visitors from Hawai'i and 42 percent of non-Hawai'i

visitors arrived by private vehicle and another 19 percent of visitors from Hawai‘i and 55 percent of non-Hawai‘i visitors arrived by rental cars.

Austin, Tsutsumi and Associates, Inc. (ATA) prepared a Traffic Impact Analysis Report (TIAR) for the Master Plan, which is attached as Appendix F. According to historic data, Kē‘ē experiences its highest attendance during the summer months. Recent traffic data was collected via pneumatic tubes placed at the Hā‘ena State Park entrance between August 14, 2008 and August 18, 2008. During this analysis period, the three-day Admission’s Day weekend was included in the counts. This was also prior to the recession and downturn in Hawai‘i visitor counts.

Weekend peak hour traffic occurred between 12:00 p.m. and 1:00 p.m. However, a large influx and efflux of traffic generally occurred between 10:45 a.m. and 3:45 p.m. Regional weekday morning and afternoon commuter traffic was assumed to occur between 8:00 a.m. and 9:00 a.m. and between 3:00 p.m. and 4:00 p.m. respectively.

A total of 1,550 vehicles per day were counted entering and exiting Hā‘ena State Park. On the average over the study period, there are 781 vehicles entering the park and 767 vehicles leaving the park. Peak traffic was observed on Sunday, August 17<sup>th</sup> between 12:00 p.m. and 1:00 p.m. where a total of 107 vehicles entered and 85 exited the park. ATA concluded that observed traffic was well below the potential capacity of a two-lane highway; two-lane highways have the potential capacity of 1,700 passenger vehicles per hour per direction of travel. However, congestion within the park occurred due to the slow speeds resulting from pedestrians on the roadways and cars waiting for parking stalls. Some waited as long as five minutes for a stall.

Although no standards exist for determining the capacity of the one-lane bridges along the highway leading up to the park, ATA used Simtraffic Analysis software to estimate a baseline for the existing traffic. The Waipā Bridge was used for the analysis since it has the longest one-lane span and is located near the State DOT’s count location. With 487 vehicles crossing the bridge in both directions per hour and an estimated bridge capacity of 1,250 vehicles per hour, the existing volume-to-capacity (VTC) ratio for the bridge is about 39 percent. This number was used to compare different scenarios for the master plan.

The most recent biennial DOT traffic counts in June 2013 registered 6,700 vehicles per day on the stretch of highway just before the County’s Hā‘ena Beach Park. This includes vehicles traveling in both directions with the counts split almost exactly in half for each direction, or roughly 3,350 traveling in each direction (DOT Kaua‘i District 2015). This is a roughly 55 percent increase since the 2003 biennial counts, which recorded over 2,100 vehicles per day in each direction in August (DOT Kaua‘i District 2007).

The overwhelming sentiment from the public and project team is that the traffic congestion is a significant problem that needs to be addressed as it continues to worsen. It causes safety concerns for pedestrians and bicyclists, backs up traffic into the neighboring areas, discourages local residents from going to the park, and negatively impacts the overall experience at the park. Community members also voiced the desire to continue to allow early morning and late

afternoon access to the park and Kēʻē Beach for recreational jogging, walking, and biking and to institute a shuttle from Princeville as the main means of bringing visitors to the park.

### ***Potential Traffic Impacts and Mitigation Measures***

Because of the unique nature of the traffic congestion and circulation issues at the park, ATA took an innovative approach to the TIAR. ATA provided analyses of engineering considerations and potential traffic impacts as well as five example shuttle service scenarios to help inform the direction and design of the preferred Master Plan. They also considered varying amounts of parking spaces at the park and estimated the potential costs and break even requirements for the shuttle.

Scenario 1 describes baseline projection of traffic with the 900-daily visitor limit but without a shuttle. Traffic is reduced and remains well below the estimated roadway capacities for two-lane highways and the one-lane bridge. However, ATA noted that there may be backups at the parking lot unless parking passes or some other parking management system is instituted.

Scenarios 2 and 3 are the shuttle scenarios, comparing the proposed 900 daily visitor limit with a smaller 50-stall parking lot and with no parking lot. The reduced parking lots were requested by members of the MPAC since it was discussed that the demand for a shuttle may not be high enough if there is ample parking at the park. For comparison's sake, ATA also studied what the shuttle requirements would be if there were no visitor limit with both a 50-stall parking lot and no parking lot in Scenarios 4 and 5.

In Scenarios 2 and 3, ATA estimated that six or seven 15-person capacity vans making nine trips per day would be needed to serve the 50-stall parking lot and no parking lot scenarios, respectively. They estimated it would cost \$10.28 and \$10.18, respectively, per person for the system to be self-sustaining. It also included a 30% contingency for low or sporadic ridership.

Scenarios 4 and 5 estimated the requirements of the current unconstrained situation with 2,000 visitors per day and found that 15 vans operating constantly from a remote parking lot would be needed to shuttle all visitors to the park or 14 vans with a 50-stall parking lot. Roundtrip shuttle tickets would need to be about \$10.80 to break even with a 50% contingency for low or sporadic ridership.

In a previous analysis, ATA provided a reverse calculation and estimated that it would take 245 riders per day at \$10 per roundtrip ticket to make a two van (15-passenger capacity) system sustainable. This is comparable to what the owners of the Experience Kauaʻi shuttle service shared with the County of Kauaʻi's North Shore Shuttle Committee in March 2014. In all the shuttle scenarios, there was not much difference in estimated costs per rider or difference in traffic impacts based on the Waipā Bridge's volume-to-capacity (VTC) ratio. The VTC ranged from 27% to 31%, compared with the existing traffic's 39%, a difference of about 55 cars per hour. The reduction in daily visitors alone is estimated to reduce the hourly flow by 100 vehicles per hour, which is less than two cars every minute.

During the meetings with the MPAC and community, various suggestions were made to encourage or even require that visitors arrive at the park by different modes of transportation

to help reduce traffic. Three concepts were explored with the MPAC: (a) Princeville-based park entry, (b) Combination on-site parking and Princeville entry facility, and (c) On-site parking only. ~~The preferred scenario, which best mitigates the potential traffic and parking impacts of the Master Plan, is described as follows.~~

The MPAC's originally preferred scenario is to implement the shuttle from the Princeville facility at the start of Phase I, minimizing the need for visitor parking in the parking lot in the park. However, the remote Princeville entry was rejected by the community due to the inconvenience of this and the fact that it might actually increase traffic for those who live closer to the park since they would have to find their way to Princeville and then double back to the park. Therefore, the Master Plan includes space to accommodate a parking lot for up to 100 vehicles ~~if needed~~. The design and materials of the parking lot would allow its size to be adjusted as the Master Plan is implemented. It could be reduced to accommodate as few as zero vehicles if the shuttle service is fully implemented and meets all needs, or expanded to accommodate up to 100 vehicles to address the possibility that the shuttle service might not be implemented on schedule or to accommodate special needs that could only be met by additional on-site parking (for example, the need for after-hours on-site parking, or additional parking for cultural practitioners, kūpuna, subsistence fishermen or ~~handicapped~~ visitors requiring ADA accessibility). This scenario should significantly reduce traffic in the park and surrounding neighborhoods. By providing visitors an alternative means to get to the park at the outset of the improvements, this will also reduce the potential for “spillover” parking issues in the surrounding neighborhoods that could happen if parking is limited without providing an alternative for visitors to access the park.

### ***Potential Roadway Impacts and Mitigation Measures***

The Master Plan includes a combination of physical improvements and programmatic options that when applied in combination will have a positive impact on the existing roadway conditions.

Vehicle access beyond the main parking area to Kē‘ē beach is proposed to be reduced from the currently unrestricted conditions to special access only (ADA, lifeguards, and cultural practitioners). Restricting general vehicular access from the main parking area to Kē‘ē Beach will effectively eliminate illegal parking along the highway’s shoulder, reduce the wear on the historic roadway’s macadam surface, and reduce the number of visitors traveling in a potential rockfall hazard area. It will also reduce the potential conflicts between vehicles and pedestrians and bicyclists as the ~~Interpretive Pedestrian~~ Path becomes the main visitor path to Kē‘ē and the highway is limited to special access vehicles, and it will reduce roadway maintenance costs for the State. Reducing the number of vehicles turning around and/or idling while waiting for parking at Kē‘ē is expected to be a beneficial impact by reducing vehicle/pedestrian conflicts; reducing dust, noise and exhaust fumes; and reducing the amount of pollutants running off vehicles and washing into the lagoon and surrounding park areas.

# SHUTTLE SERVICE

## 4.3.3 PUBLIC TRANSIT AND SHUTTLE SERVICE

### *Existing Conditions*

The County of Kauaʻi Transportation Agency provides public transit service between Hanalei and Kekaha via the Kauaʻi Bus. Service between Līhuʻe and Hanalei is provided ~~six~~seven days a week, ~~Monday through Saturday~~, between ~~6:20-5:25~~ a.m. and ~~8:00-10:40~~ p.m. Route ~~400/450~~ runs from the Hanalei Courthouse to Kauaʻi Community College and Route 500 runs in the opposite direction. Fares are \$2.00 per trip for adults, \$1.00 per trip for seniors (60+ years) and youth (7–18 years). The County also offers monthly passes for ~~\$35.00~~\$40.00 and annual passes for \$400.00. All buses are wheelchair accessible. Folding baby strollers, musical instruments, and body boards are permitted onboard. However, surfboards, large backpacks and other bulky items that block the aisle or seat are not permitted onboard. Currently, there is no public transportation service to Hāʻena. Private shuttles and taxis can be arranged for a fee.

In 2014, the County provided a \$75,000 grant to a private shuttle operator, Experience Kauaʻi, to supplement the County’s transit service between Princeville and Kēʻē in an experiment to see what the ridership potential would be and to reduce traffic along this stretch of the highway. In its first month of operation in November 2014, they had over 1,000 passengers. In January 2015, ridership peaked with nearly 1,900 riders and average monthly ridership was over 1,500. The shuttle used two 15-passenger vehicles and charged introductory fares of \$2 each way for visitors and \$1 each way for residents during its first two weeks. After that, the fares increased to \$4 and \$2, respectively. Between 41 and 50 percent of riders were residents.

The shuttle service runs-ran from 6:00 AM until 7:00 PM originating at the Westin Princeville, stopping at major resorts, the Princeville Center, Hanalei Town, the Wainiha Store, Hanalei Colony Resort, and Hāʻena Beach Park before heading to Kēʻē. The shuttle then ~~reverses~~reversed its route back to Hanalei Town. At 9:00 AM, the second shuttle ~~starts-began~~ running between Princeville and Hanalei, while the earlier shuttle ~~loops-looped~~ between Hanalei and Kēʻē to increase frequency of service. Funding to support the shuttle, however, was not provided in the 2015-2016 County budget approved by the County Council in June 2015.

### *Potential Impacts and Mitigation Measures*

The preferred scenario described in the Master Plan proposes a combination of shuttle service to the park with ~~reduced~~ parking on-site as part of Phase I of implementation. While State Parks is unlikely to initiate its own shuttle service, several options for a shuttle system are identified in the Master Plan including extending the County public transit service to Kēʻē, contracting with a third-party operator to provide the service, or allowing independent private shuttles to stop at the park, or a combination of the above. The Master Plan identifies a shuttle stop in the proposed Master Plan with sheltered seating areas along the turnaround at the entry to the park. The turnaround should be designed to allow other vehicles to pass while shuttles are stopped at the shuttle stop in order to reduce backups and congestion along the highway. In order to encourage ridership, the shuttle service should be initiated in Phase I and the parking lot should be sized appropriately. Various management strategies including parking and entry

fees, point of entry tickets sales are also discussed in the Master Plan report to provide a range of options to support the shuttle.

If the shuttle service is implemented, it has the potential benefit of serving multiple populations including residents and not just park visitors depending on the stop locations, frequency, cost, and quality of the service. Recent record rainfall events, mudslides, and highway closures have brought a new focus and opportunity to change how transportation operates on the North Shore as a whole. State Parks is actively working with the County and the community to discuss potential solutions to these issues. If shuttle service to the park is not implemented, the larger parking lot will need to be constructed to serve the park and a grass surface is not recommended since grass would require that the parking lot be uncovered for at least three days out of the week to receive adequate sun. If the parking spaces turn over two to three times during the peak hours, the 100 stalls are estimated to be sufficient if visitors are carpooling and arriving with an average of three people per vehicle. Green vehicles such as electric vehicles that can be charged with renewable energy sources such as solar PV or vehicles that use alternative fuels and have low or no emissions are recommended to reduce the impact to air quality and consumption of fossil fuels.

# WASTEWATER

## 4.7.2 WASTEWATER

### *Existing Conditions*

Hā'ena State Park's first comfort station was built in 1979 at Kē'ē Beach by DLNR and wastewater previously emptied into a six by eight-foot diameter cesspool. In 2001, a 2,500-gallon individual wastewater system including a 2,500 gallon septic tank and 2,700 s.f. leach field was built for the comfort station to comply with EPA's large capacity cesspool closures.

In 2008, the original comfort station was demolished and replaced by a new one built in the same location. It maintains the same number of fixtures as the original – three water closets, one urinal, and two lavatories (sinks). These fixtures are estimated to generate 2,016 gpd (Kennedy/Jenks 2011). According to DOH standards for picnic parks, this equates to approximately 403 visitors per day based on an average 5 gpd per person (toilet wastes only). An outdoor shower with multiple shower heads and spigots is located to the south of the comfort station and runoff water is allowed to drain and infiltrate into the surrounding soils.

In the years 2007-2010, DLNR and members of the Hā'ena community collaborated on the design of an alternate individual wastewater system to mitigate impacts to cultural and archaeological resources beneath the existing leach field. The preferred design of a more natural system, or constructed wetland, was installed in 2011. The constructed wetland is a subsurface flow-based wastewater treatment system, or one where the constructed wetland is contained within a liner, but the wastewater flows beneath the surface of a gravel medium within the liner so there is no exposed water under normal operating conditions. Native plants such as makaloa (*Cyperus laevigatus*) and ahu'awa (*Cyperus javanicus*), two perennial sedges, are native species that were planted within the constructed wetland. Wastewater is first treated within a primary treatment tank. Then, the effluent flows to the constructed wetland where it is further treated by having the plants take up nitrogen and more importantly, create an environment where organisms that thrive in the root systems can feed on bacteria in the wastewater, further improving water quality before discharging it into the leaching chambers. The new infiltration field is located to the east of the archaeological site but west of the delineated natural wetlands of the two loko. The new comfort station and treatment facilities are sized to manage the same amount of wastewater, 2,016 gpd, or roughly 403 visitors per day, based on DOH standards (Kennedy/Jenks 2011). The existing septic tank and leach field will continue to serve as an emergency backup system in the event the constructed wetlands system is not operational.

Greywater from the outdoor shower at Kē'ē is allowed to infiltrate into the surrounding ground.

In addition to the existing comfort station wastewater system, an abandoned cesspool was found at the Montgomery House. The existing Allerton House and Caretaker's Cottage also likely have abandoned cesspools.

### ***Potential Impacts and Mitigation Measures***

Due to the remoteness of the park, Kennedy/Jenks does not propose connection to any public sanitary sewer systems and recommends that all wastewater be treated with an aerobic system with aeration to a minimum of R-2 water quality and disposed of on-site. As noted by the DOH, the project is located in a critical wastewater disposal area as determined by the Kauaʻi County Wastewater Advisory Committee and no new cesspools are permitted. All individual wastewater systems proposed for the park will be set back as required from State surface waters such as wetlands. All wastewater plans must conform to applicable provisions of the DOH Administrative Rules Chapter 11-62, “Wastewater Systems” and the DOH reserves the right to review the detailed wastewater plans for conformance to applicable rules.

The addition of the ~~Welcome Pavilion/ECC, Caretaker’s Cottage, and Hale at the Cultural Gathering Place~~ new restrooms near the Welcome Hale as well as the restoration of the Allerton Caretaker’s Cottage and Montgomery House will include additional restroom facilities. However, as noted, the actual number of people using the facilities will decrease with the recommended reduction in daily visitor counts. In addition, toilets and water fixtures are becoming more efficient, which will also contribute to the reduction of projected water use per person. Therefore the overall volume of projected wastewater generated at the park will be less than current conditions.

The availability of new restroom facilities ~~at~~ near the Welcome ~~Hale Pavilion/ECC~~ is anticipated to help reduce the use of the Kēʻē comfort stations and therefore lessen the impact to nearby cultural and archaeological sites. Due to the remoteness of the Allerton Caretaker’s Cottage and Montgomery House, they will require individual wastewater systems, which should also consider using natural systems to treat and improve water quality to minimize potential impacts and allow the effluent to be reused.

Based on strong community preference, the Master Plan proposes that any new wastewater systems include an aerobic wastewater treatment system that brings wastewater to an R-2 water quality level at a minimum and to reuse the effluent as much as possible to minimize impacts to the sensitive natural and cultural resources at the park. The following details the suite of mitigation measures under consideration to offset any impacts that could be caused by wastewater treatment and disposal:

- Treatment for wastewater should be with aerobic systems to a minimum R-2 water quality, with aeration and non-chlorine treatment such as UV disinfection to improve effluent quality. Consider using renewable energy sources to provide power.
- To minimize the footprint of wastewater facilities on ecological, cultural and archaeological resources, locate effluent absorption beds under parking lots and driveways if permitted. DOH requires the use of aerobic treatment units certified by NSF/ANSI 245 for systems that discharge directly into the groundwater.
- Add aeration to the existing constructed wetlands primary treatment tanks, powered by a PV system and replace the plants at the constructed wetlands to high-nutrient removing plants to improve water quality.
- For remote, low-use facilities, such as the Cultural Gathering Place, Montgomery House, and the Hula Complex, utilize composting toilets or ~~temporary/portable facilities as needed~~ innovative wastewater technologies.

- Use non-chemical disinfectants and cleaning products for maintenance, particularly in composting toilets, to minimize impacts to wastewater treatment processes and effluent quality. Use environmentally-safe soaps that contain plant nutrients and biocompatible cleaners.
- ~~Since the proposed wastewater facilities are currently not standard according to the DOH,~~ Include maintenance manuals and provide instruction to ensure proper upkeep of all wastewater systems at the park.
- Reuse effluent for irrigation, dust control, or toilet flushing rather than disposal.
- As an alternative, vault systems, which are fully contained and can be pumped and treated at an off-site facility are also being considered should effluent reuse not be possible onsite.

Kennedy/Jenks also provides a matrix of design alternatives in their Wastewater Preliminary Engineering Report (Appendix H), which will assist State Parks in selecting the appropriate wastewater treatment system at the time of building design. Beyond recommending that secondary treatment be provided at a minimum, the Master Plan does not prescribe the specific type of systems to be employed, allowing maximum flexibility for building designers to take advantage of emerging technologies in wastewater management. If defunct cesspools are located during the construction process, they will be abandoned in accordance with current regulations.

#### ***2.5.3.1 Integrated Water/Wastewater/Drainage System***

The proposed Master Plan recommends installing an integrated water/wastewater/drainage system to maximize the efficiency and use of on-site water resources. It includes collecting rainwater and using treated wastewater for nonpotable water uses to minimize demand for potable water, as well as restoring the ‘auwai wherever possible and improving the drainage of surface runoff to irrigate surrounding garden areas or the lo‘i if it can be appropriately filtered.

Specific design considerations for the integrated water/wastewater/drainage systems include:

- Using treated wastewater effluent and collected rainwater for irrigating the landscaping around the facilities such as the ~~ECC, picnic area, Caretaker’s Cottage and baseyard~~ Montgomery House, Allerton Caretaker’s Cottage, Welcome Hale, parking lot, and new restrooms. There are three levels of treated wastewater recognized by the State Department of Health (DOH) as recycled water. R-1 has the highest level of treatment and R-3 the lowest (Kennedy/Jenks 2010). The Master Plan recommends aerobic wastewater treatment to at least R-2. If the treated water quality is R-2, irrigation systems must be subsurface with no over-ground sprays. If the effluent is treated to R-1, over-ground spray and drip systems can be installed.
- Using recycled water and collected rainwater for toilet flushing at the ~~ECC, Caretaker’s Cottage~~ new restrooms, Allerton Caretaker’s Cottage, and Montgomery House to conserve potable water.
- Reducing the need for stream diversions by restoring the ‘auwai and collecting, storing and using rainwater.
- Using non-potable water for fire protection. Collected rainwater or even ocean water can be used for fire protection in emergencies.

- Directing rainwater runoff from the main parking to landscaped areas and rain gardens. Where possible, collecting and storing rainwater for reuse such as irrigation and possibly toilet flushing.
- Redesigning Kūhiō Highway culverts so that rainwater that passes beneath it flows more naturally and can be filtered and used in the ‘auwai system.

Control measures to prevent the spread of apple snails from the park’s lo‘i to Limahuli Stream should be included in any design or implementation of the ‘auwai and irrigation systems for the Agricultural Complex. Some suggestions include but are not limited to:

- Elevating and extending the outfall pipes from the Limahuli Stream diversions above the receiving ‘auwai so that the snails cannot crawl directly into the stream. The snails are known to dislike cold, fast-moving water, which is what flows from Limahuli Stream, and so the risk is minimized.
- Grading the ‘auwai to flow makai and away from Limahuli Stream.

For items specific to wastewater treatment:

- Treatment for wastewater should be with aerobic systems to a minimum R-2 water quality, with aeration and non-chlorine treatment such as ultraviolet (UV) disinfection to improve effluent quality. Consider using renewable energy sources to provide power.
- Locate effluent absorption beds under parking lots and driveways if permitted. DOH requires the use of aerobic treatment units certified by NSF/ANSI 245 for systems that discharge directly into the groundwater.
- Provide aeration to the existing constructed wetlands primary treatment tanks, powered by a PV system and replace the plants at the constructed wetlands to high-nutrient removing plants to improve water quality.
- For remote, low use facilities, consider composting toilets or ~~temporary/portable facilities as needed~~ innovative wastewater technologies.
- Use non-chemical disinfectants and cleaning products for maintenance, particularly in composting toilets, to minimize impacts to wastewater treatment processes and effluent quality. Use environmentally-safe soaps that contain plant nutrients and biocompatible cleaners.
- Since the proposed wastewater facilities are currently not standard according to the State Department of Health (DOH), include maintenance manuals and provide instruction to ensure proper upkeep of all wastewater systems at the park.
- As an alternative, vault systems, which are fully contained and can be pumped and treated at an off-site facility are also being considered should effluent reuse not be possible onsite.

## SOLID WASTE

### 4.7.5 SOLID WASTE DISPOSAL

#### *Existing Conditions*

Trash receptacles and recycle bins are stationed throughout the Kēʻē Beach area. State Parks staff provides trash removal on a daily basis.

#### *Potential Impacts and Mitigation Measures*

Although fewer users to the park will likely result in less trash generated at the park, State Parks will also recommend that all visitors carry in what they carry out. In addition, new trash receptacles will be provided at the Welcome Pavilion/ECC-Hale, picnic areas, ~~Caretaker's Cottage~~, Montgomery House, and Allerton Caretaker's Cottage so that waste disposal is convenient to park users. Recycle bins are recommended to be installed along with trash receptacles and all receptacles are proposed to have animal-proof lids to minimize foraging by feral cats, dogs, rats and chickens and reduce the potential for windblown debris. Daily maintenance and removal of trash and recyclables is recommended to be continued at the park to minimize the amount of solid waste at the park that may be windblown or washed into the ocean, stream, and other sensitive natural and cultural environments. There may be hazardous substances, pollutants, or contaminants to be present in the soils in the areas where there were abandoned vehicles. However, no work is anticipated in these areas at this time. State Parks will work with the State HEER Office to determine the appropriate actions to comply with the relevant environmental laws if applicable should any work occur in those areas.

# ENDANGERED SPECIES ACT

## 5.1.2 ENDANGERED SPECIES ACT

The Endangered Species Act of 1973 provides a program for the conservation of threatened and endangered plants and animals and their habitats. The lead federal agencies for implementing the Act are the USFWS and the NOAA Fisheries Service.

**Discussion:** Hā'ena's biological resources, along with mitigation measures are discussed in greater detail later in this report, in Sections 3.5-3.9. The USFWS provided a Technical Assistance letter in response to the pre-consultation process (see Section 11.0). The letter confirms that there is no federally-designated critical habitat within the park. However, endangered and threatened species are known to either frequent or to exist within the park. USFWS confirmed this in their subsequent comment letter on the EISPN (see Section 12.0). The letter provides additional recommendations to minimize impacts to protected species which have been incorporated into this DEIS and discussed further in Chapter 3.0. 'Īlio-holo-i-ka-uaua, the Hawaiian monk seal (*Monachus schauinslandi*), 'ōpe'ape'a or Hawaiian hoary bat (*Lasiurus cinereus semotus*), honu or native green sea turtle (*Chelonia mydas*), and honu 'ea or hawksbill turtle (*Eretmochelys imbricata*), along with a number of native Hawaiian waterbirds are listed by the Endangered Species Act as "Threatened" or "Endangered" and are among those that may frequent the park. In August 2015, the National Marine Fisheries Service (NMFS) issued a final rule revising the critical habitat for the Hawaiian monk seals to include the marine habitat fronting Hā'ena State Park from the 200-meter depth contour line, including the seafloor, through the water's edge and 5 meters into the terrestrial environment from the shoreline (50 Code of Federal Regulations Part 226). Therefore, any changes in these areas will require consultation with the NMFS. Also, if habitats are created within the park specifically for endangered or threatened wildlife, additional permits and approvals may be required such as a Habitat Conservation Plan. USFWS recognizes that the proposed Master Plan is a programmatic project and recommends that State Parks contact them for technical assistance should any proposed actions be determined to affect federally-listed species.

# KAUA‘I GENERAL PLAN

## 5.4.1 KAUA‘I GENERAL PLAN

The General Plan (GP) of the County of Kaua‘i is a policy document that fulfills legal mandates of State law and the Charter of the County of Kaua‘i. It is intended to help guide long-range development for the enhancement and improvement of life on Kaua‘i, advancement of the County’s vision for Kaua‘i, and the establishment of strategies to help achieve that vision including recommended land uses. The most recent GP ~~is currently undergoing another update~~ was adopted in March 2018. ~~However, it was last adopted in 2000 and~~ It designates the park as “Parks and Recreation” on the North Shore Land Use Map (Figure 32). The GP North Shore Planning District Heritage Resources Map identifies the park as a ~~conservation area~~ “State & County Park” and notes that ~~heiau~~ cultural sites ~~and traditional cultivation areas~~ are located within the park ~~and a regulated fishing area and coral reefs are located offshore fronting the park~~ (Figure 33).

~~Various policies in the GP cover parks, some with specific reference to Hā‘ena State Park.~~

~~The GP identifies “sharing of recreation resources with visitors” as an issue and opportunity:  
Many visitors travel to the North Shore to enjoy its beaches and unique natural areas. The impact is especially great in the Hanalei-Hā‘ena region which has a large share of visitor attractions. Heavy visitor use can displace residents or significantly change the quality of the experience, especially at beaches and parks. Residents need to work with business people and parks agencies to identify: (1) parks and natural areas where visitors will be welcomed and accommodated, with levels of use based on parking or other easily managed limits; and (2) parks and natural areas where it is important to more strictly limit access in order to preserve the resources and/or the quality of the recreation experience (Sec. 6.1.3).~~

~~GP policies related to Kaua‘i’s parks and natural areas (both County and State) include:~~

~~Encourage the development of public-private partnerships involving the County and the Department of Land and Natural Resources in order to manage and improve Kaua‘i’s valuable parks and open spaces (4.2.8.3(a)).~~

~~Manage beach parks, resource parks, rivers, beaches and other natural areas according to the following policies in order of priority: (1) Conserve resources. (2) Provide for use by the general public—i.e., individuals, families, ohana. (3) Allow for group use (including commercial tours and equipment rentals) within conservation limits (4.2.8.3(e)).~~

~~To enhance the visitor’s experience of Kaua‘i and to provide meaningful jobs and income to Kaua‘i residents, the County shall develop or support development of the following programs by Federal, State or private agencies: (1) Regional visitor centers. (2) First person interpretation of natural areas, historic and archaeological sites, traditional agricultural and cultural practices, towns and communities. (3) Study and~~

~~practice of Native Hawaiian and other ethnic cultural traditions and languages, including the development of cultural learning centers (4.2.8.3(d)).~~

~~Improve facilities, maintenance, and management of activities at State and County parks. Specific actions include: (1) Commit the necessary resources to ensure adequate levels of park maintenance, repair and hygiene and to improve signage and interpretation of natural and cultural features. (2) In resource parks that receive heavy visitation, such as... Hā'ena, ... plan and improve specific areas to support larger numbers of visitors; manage other areas for moderate or low use, based on conservation objectives. Prepare and update Master Plans for major parks. ... (4.2.8.3(e)).~~

Relevant sections of the GP involve discussions related to improving transportation to the park and support of the State's effort to implement the master plan for the park and provide adequate funding for maintenance and staffing.

Section 2.4.6 of the GP notes the following policy opportunity for the North Shore:

*Integrating Transit: The integration of consolidated parking and transit facilities was a common discussion thread throughout the North Shore communities. Participants considered ways that pools of public parking and transit stops could be integrated into town centers, establishing "park-once" facilities and providing convenient transfer points for tourists accessing Kīlauea Lighthouse and Hā'ena State Park, with the goal of mitigating the impact of tourist traffic on the Kūhiō Highway and parking facilities at existing visitor destinations. (SSFM 2018)*

Section 3.IV focuses on the economy and actions to support key industries. Under the "Tourism" Subsection, "1.3 Improving the Visitor Experience and Impacts on Communities," the GP states, "Managing visitor impacts also includes improving visitor facilities and parking at both County and State parks, and ocean safety at beaches. Given that impacts disproportionally affect certain areas of the island, particularly the North Shore and South Kāua'i districts, shuttle efforts, parking improvements, and other solutions should be focused there." (SSFM 2018)

Section 3.V.4 summarizes the actions for Kauai's State Parks and recognizes this master plan effort for Hā'ena State Park. It also notes:

*In addition to traffic and parking issues, Hā'ena State Park, Kōke'e State Park, and Waimea Canyon State Park are underfunded relative to the demands placed on them. For example, limited parking at Hā'ena State Park has led to illegal parking and frustration for visitors and residents seeking to visit the many attractions nearby. An unmanaged parking situation has contributed to high rates of theft and vandalism at the parking lot. (SSFM 2018)*

It also identifies the following relevant "Partnership Needs:"

1. *Implement the Waimea Canyon, Kōke'e, and Hā'ena State Park Master Plans.*

3. Support adequate funding and staffing for capital improvements, including maintenance and enforcement for public parks, trails, and recreation areas.
4. Improve and coordinate infrastructure and transportation to reduce visitor impacts.

The GP also identifies the North Shore Shuttle running from Kilauea Lighthouse to Kēʻē Beach as a "Priority Transit Capacity Project" in its Table 5-2 and Figure 5.37.

**Discussion:** The master planning of parks, such as Hāʻena State Park, and the appropriate management, maintenance, staffing, funding, and enforcement of the parks including ~~"limit[ing] access in order to preserve the resources and/or the quality of the recreation experience"~~ (Sec. 6.1.3) ~~is prioritizing parking and transportation improvements for the North Shore are~~ clearly supported by the County's GP. The GP recognizes the need for management measures to balance visitor demand and conservation needs. ~~It identifies the conservation of resources as the first priority in the management of beach parks (Sec. 4.2.8.3(e)).~~ Further, the Plan identifies the need for adequate funding to implement management, interpretation, and maintenance of park facilities.

The proposed Master Plan seeks to address the issues and opportunities relating to the visitor experience on Kauaʻi's North Shore. Community sentiment throughout the Master Planning process has been that the park's cultural and ecological resources are overwhelmed by visitor volume and use. The purpose of the Master Plan is to help temper the volume of visitors and encourage interaction with the resources without being a detriment to them. As such, the proposed Master Plan is consistent with the GP policies to improve park facilities, conserve natural and cultural resources, protect public safety and improve hygiene to find a balance with public use. It also supports the development of the North Shore Shuttle to help mitigate traffic to the park.

# NORTH SHORE DEVELOPMENT PLAN

## 5.4.2 NORTH SHORE DEVELOPMENT PLAN

The North Shore Development Plan (DP) designates Hā'ena State Park and surrounding lands as "Open" (Figure 34). The DP provides a framework for guidelines to direct the physical locations and relationships of major improvements, buildings and landscape within the North Shore Special Planning Area. Relevant North Shore Planning Area goals include:

- *Goal A: To preserve the unique natural beauty of the North Shore Planning Area.*
- *Goal E: To preserve the wildlife and flora of the North Shore, recognizing man's dependence upon this preservation for his own health and welfare.*
- *Goal F: To insure the preservation of the historic-archaeological sites in the North Shore Planning Area.*
- *Goal H: To provide for recreational opportunities that are compatible with the unique qualities and natural features of the North Shore.*

More specific DP recommendations that relate to natural resources and outdoor recreation and are applicable to the Master Plan are as follows:

*Only basic supportive facilities should be provided at outdoor recreation areas selected for widespread public use in order to enhance the experience.*

*Multiple activity recreation areas must be managed to avoid hazardous conflicts between recreators and allow maximum use of resources.*

*Although public access is obtained to recreational resource areas, publicity should be minimized unless the appropriate agency can assure adequate management and security measures. In this manner, local residents would be allowed to continue traditional patterns of resource use.*

**Discussion:** The Master Plan and supporting management actions address the recommendations of this County planning document. As one of the most popular visitor destinations on the island, Hā'ena State Park had become a victim of its success, becoming overcrowded and experiencing conflicts between the varied recreational and cultural uses of the park. The new facilities, educational and interpretive materials and programs, and changes in management and maintenance will improve the conditions at the park, better protecting and caring for the natural, cultural, historic, and scenic resources. The orientation session all visitors must attend will help educate visitors on the unique and sensitive resources at the park and appropriate behavior, protocols, and activities which will in turn engender a greater sense of respect and aloha visitors have while at the park. The proposed educational programs and interpretive materials will also enrich the visitor experience as they learn about the varied and multilayered resources of this storied place.

The proposed Master Plan also encourages the development of a shuttle system to serve visitor access to the park and reduce congestion and traffic on the existing highway. Due to the potential for rockfalls and to increase safety, general through traffic will be terminated at entry turnaround and a separate pedestrian ~~and bicycle~~ path has been designated makai of the highway ~~via the Interpretive Path~~.

# DRAFT EIS PUBLIC MEETING

## 8.3.3 DRAFT EIS PUBLIC MEETING

A public meeting to incorporate community concerns in the EIS ~~will be~~ was held on August 19, 2015 during the Draft EIS public comment period. Oral comments and questions were fielded during the meeting. Comment cards were distributed to the attendees who were given the option to fill them out and turn them in that evening or mail them to PBR Hawaii. Attendees were also encouraged to distribute the comment cards to those who were not able to attend the meeting and submit them to PBR Hawaii. Email addresses where attendees could submit comments were also shared at the end of the PowerPoint presentation. Substantive written and oral comments received during the meeting ~~will be incorporated into the EIS~~ are summarized below. Written comments that included a mailing address were sent written responses and both are included in Section 13.0 of the EIS. Written comments that did not include a mailing address were also responded to but not mailed and are included in Section 13.0.

The following summarizes the oral and written comments received and collected during the August 19, 2015 public meeting. They are organized by topic and are individually responded to in Section 13.0.

### **Facilities:**

- The large visitor center is not desired. Seems to cater to tourists and not for locals.
- Like the education center/build a community education "building" to inform people about the land
- No gates blocking the view down the highway.
- No commercial vendors or gift shops.
- No caretaker's cottage. No types of building at Kē'ē (no permanent structures, no pavement at all, no new bathrooms). No fences. No boardwalk. No gates. No bridges.
- Like the integration of natural hazard avoidance, reduced threats by locating boardwalk outside of rockfall area; cultural practices; preservation of important historic and cultural sites; encouraging revitalization of sites; outdoor recreation; education; local advisory committee; scaled-down outdoor recreation impacts and footprint
- Supports the cultural and rehabilitation/restoration of lo'i aspects
- Move the entrance further down the road, do not make the stream the entrance so that locals can still use Cold Pond and stream
- Hope it doesn't desecrate loved one's grave sites
- Limahuli Gardens has a visitor center that explains local history/culture

### **Park Access and Proposed Visitor Limits:**

- Concern regarding limiting access to only 900 people per day. What happens if the 900<sup>th</sup> guest is reached but splits a family or group of friends? Can the limit apply to tourists and not locals?/limit should be set at 500 tourists per day/no limit for locals
- Concern over the limited parking at the park and having the traffic and cars spill over into the County park, along the highway, and down to Makua

- Perhaps one day a week can be closed to non-residences, or provide privileges for Hawaiian organizations
- Concern over limited access during early morning or late afternoons
- Would like to see online ticketing, permit, entry access with set number for visitors and set number for residents
- Require limited permits for tourists/unlimited access for locals and guests
- Do not count walkers and bikers in the daily count (should be free)
- There is fishing at night/allow beach access to walk on at all hours of day for all the people
- Limiting local access is not helping the problem is the number of people visiting Kaua'i
- Keep the white people out
- Applaud the proposed exemption of fishermen and hunters from the visitor limit
- No priority to hunters and fisherman
- No access fees for locals/residents
- No gate guard
- State parks are to be enjoyed by the people, especially residents. Do not discriminate against taxpaying residents to the benefit of cultural practitioners, hunters, and fisherman
- Visitors should have to apply for a day pass to visit the park, but residents should be able to obtain passes valid for one year or longer
- Allow foot and bike access
- Put gates at the start of the actual park to regulate the 500 limit; but allow volunteers/locals with permits (sticker) to enter; second gate at Kumu road, limiting the traffic to all of the land past Hanalei to 1,500 per day, plus local residents
- Threatens access rights by closing areas
- The plan smacks of localism/ detests the twisting of the definition of volunteer to accommodate Hā'ena locals; park belongs to ALL, not just North Shore residents/shame on you for blaming tourists

### **Parking and Shuttle:**

- Is there way to discriminate against rental cars?
- Limit parking and force paid shuttle rides/parking by permit only (with a fee)/50 parking stalls with permits, 50 without
- Force tourists to use the shuttle and get permits, not kama'aina
- Much planning should go into the shuttle aspect of the plan- communication and networking with resorts is critical
- Provide pamphlets for those riding the shuttle explaining cultural significance and environmental sensitivities
- Subsidize shuttle
- Require hotels and time share hotels to provide shuttle service; shuttles paid for by businesses/tourists; require Hawai'i Visitors Bureau to contribute funds to finance shuttle and shuttle infrastructure
- Concerns about parking and whether people, and/or cars will be limited

- All permanent residents get a resident car sticker for access
- Bring back the shuttle
- All North Shore beaches roadside parking need to be policed and ticketed accordingly.
- Stop all traffic in Princeville and supply regular shuttles from before sunrise until after sunset is a better plan and only allow Hawaii residents to drive over Hanalei River Bridge
- Shuttles are a good idea but should incorporate Hanalei into the scheduled service so tourists can stop for food and shopping/shuttles should start at Princeville
- Limit truck/car traffic to 500 per day
- Have shuttles run every 15 minutes, from 8 am- 5 pm; charge parking fees of \$20-30 to park (Hawai'i residents exempt); would result in 90% of current traffic to opt to take shuttle, even residents would
- State or federal money should fund the shuttle system to get people past Hanalei. Tourists staying in Princeville should be shuttled to Kē'ē, Tunnels, Lumahai, and Hanalei; North Shore hotels and condos should provide transportation from airport to North Shore, then shuttles should move tourists around North Shore

#### **Park Management and Visitor Education:**

- Explore specifics of organizations to manage plan.
- Address how monies should be used.
- Information about issues of Kē'ē should be given to visitors in a non-aggressive way before they arrive/educate tourists before they reach Lumahai
- Proposes a day or half day of rest for the park
- Note: you have defined the limits of acceptable change (do not use the term carrying capacity)
- No halau own Kē'ē, all kumu must respect Hā'ena tradition
- Do not allow any plants to be touched
- Waiakapala'e is for women
- No new age practitioners should be considered as cultural religious practitioners
- Overly controlled by the State, removes the natural joy of the area
- Community should be informed before plan is implemented
- Continue community advisory committee permanently

#### **Natural Resources:**

- Above and beyond parking concerns are the conservation considerations (i.e. a struggling, environmentally compromised coral reef area)
- Threatens wildlife, burial sites, and deface mountain/goes against all conservation purposes
- Bad area for tsunami zone

#### **General Comments:**

- Do not support/approve the plan.
- In support of the plan/For the most part like the plan/in total support of the plan.

- Master plan for the whole region is needed/EIS needed for whole region
- Anti-government sentiment/consult lawful Hawaiian government/no federal government involvement
- Interested in volunteering/think volunteer provision is really important
- Restore the damage that has already occurred
- Unsure if the plan will work
- Proposes more police activity/patrolling
- Get with all Hā'ena families and get responses and ideas in the plan
- There were both positives and negatives with this plan
- Maintain an area that is truly allowed to run wild (Aldo Leopold-style)
- Request more time to respond
- Stop rampant promoting and advertising of the area/capping the visitor count through HTA and Kaua'i Visitor Bureau should be considered, even at the risk of diminished tourism revenue
- Something has to be done-see the extreme number of cars and people and damage to the trail and ocean; plan can be fine-tuned later
- Likes that there are options and that the plan is adaptive
- Mahalo for helping protect this beautiful island/ appreciate the hard work that has gone into planning

SUBJECT: Hā'ena State Park Master Plan Community Open House –  
October 24 & 25, 2008

The purpose of this open house was to re-engage with the Hā'ena community to begin the process of updating the Community Preferred Master Plan that was initiated in the 1990's.

A. Limahuli Garden: Friday, October 24, 4:00 PM – 7:00 PM & Saturday, October 25, 9:00 AM – 12:00 Noon

1. In general, attendees knew of the former Community Preferred Master Plan, but wanted to spend more time with it to refresh their memory and see if it is still relevant. A number of people's first question was whether or not a gate at the entrance was still part of the plan. People were also interested in knowing if there would be more meetings, so that they could participate in the decision-making process. Questions were also asked as to how State Parks intended to fund any improvements to the park.
2. Auntie Louise – Organizing an All Soul's Day (Nov. 1) walk from Naue to Kē'e to get a feeling from Hā'ena people what they want for their land.
3. Melinda Sandler – Suggested that a better way to inform Hā'ena and Hanalei people is to do a PO Box drop to announce future community meetings.
4. Alison Chaung – Requested a hard copy of the highlighted 1999 Community Preferred Master Plan.
5. Andrew Cabebe – Expressed concerns about the Wainiha Stream diversion. Wealthy land owners had promised to release water, but have not.

MEETING NOTES  
Community Open House  
October 24 & 25  
Page 2

6. Barbara Robeson
  - a. Indicated that the Kuhio Highway was on the National Register to the ten mile marker. She indicated that this should be documented on register nomination forms. Dawn Duesing worked with Barbara on the register forms and Barbara could get PBR HAWAII Dawn's contact information if we would like it, however, Dawn is out of the country for an extended period of time.
  - b. Indicated that the Lihue Library, Hawaiiiana section had a number of old maps that may be of use. Barbara would be willing to accompany PBR HAWAII staff or sub-consultants if we would like to view maps.
  - c. Kauai Historical Society contains a number of oral histories.
  - d. Taylor Camp archaeology article from a Mainland journal or newspaper was recently written, but she could not remember the publication.
7. Kawika Winter – requested an aerial and an electronic version of the Community Preferred Master Plan.
8. Sailor DeCamp –
  - a. Concerned about private homeowners diverting water from Limahuli Stream.
  - b. Did not feel that the 1990's Community Preferred Master Plan had complete community buy-in.
  - c. Felt that those tourists that want and deserve to have a natural experience at Hā'ena will be willing to walk and explore the park, which is preferred to constructing facilities to improve capacity.
  - d. Development at Princeville is fueling large visitor numbers at Hā'ena State Park. A shuttle at Princeville, operated privately, with appropriate fees should be provided.
- B. Lihue, Saturday, October 25, 2:00 PM – 5:00 PM. The Saturday afternoon open house was sparsely attended, and primarily consisted of a discussion between State Parks Staff, PBR HAWAII Staff and Randy Wichman, a member of the Kaua'i Historic Preservation Review Commission.
  1. Randy Wichman shared a number of thoughts and observations:
    - a. Multidisciplinary approach to planning and managing the park. He suggested that there are many facets to the park, and the various disciplines should have decision-making power over those facets. Examples include rules for fishery, Hui Maka'ainana o Makana with the curatorship of the taro lo'i. In addition, disciplines need to manage the hula platform, other cultural sites, land-based natural resources, etc. Suggested looking for public/private and educational partnerships.
    - b. Must have knowledge of key features before planning walking trails and the trail should parallel the dunes, closer to loko where the land is less environmentally sensitive than the dunes. The following sites must be considered in how the path will meander:
      - i. Archaeology
      - ii. Tree and rockfall hazards
      - iii. House sites/kuleana lots
      - iv. 'Auwai – mentioned flow charts that Alan Carpenter worked on
      - v. Poi mill site

MEETING NOTES  
Community Open House  
October 24 & 25  
Page 3

- vi. Loihau's House
- vii. Hula Platform
- viii. Heiau

- c. Cultural Viewplanes should be considered in park layout.
  - d. Buffer around cultural resources such as Lohi'au's house, poi mill, grave sites.
  - e. Regarding fees, Randy inquired if the Governor would be making a decision to charge fees at Hā'ena and Kōke'e State Parks.
  - f. Suggested that what is labeled as Allerton's caretaker's cottage could be a staging area for Halau, cautioned that there will be challenges with re-constructing historic structure.
  - g. Regarding water, Wayne Souza explained that State Parks built the water system and gave it to the County.
  - h. Megan Juran inquired as to a landscape plan for the comfort station because the plant that looks like false taro or "elephant ears" is colonizing the disturbed areas quickly.
2. The group discussed management models such as Hanauma Bay, which includes collection of a fee, limits the number of visitors at any one time and has a mandatory educational component. Another alternative model is that of the CCC camp being taken over by hui laka as a management entity, with visitors restricted to researchers with the occasional tour group visiting and paying a fee to generate revenue. The group also discussed the possibility of making park reservations on line, similar to that of a campground.

## ***Hā'ena State Park Master Plan***

---

Public Meeting  
July 10, 2010  
1:00 – 4:00 PM

## ***Welcome!***

---

- Pule
- Welcome
- Project Team Introductions
  - State Parks
  - Master Plan Advisory Committee
  - Kennedy Jenks
  - PBR Hawai'i

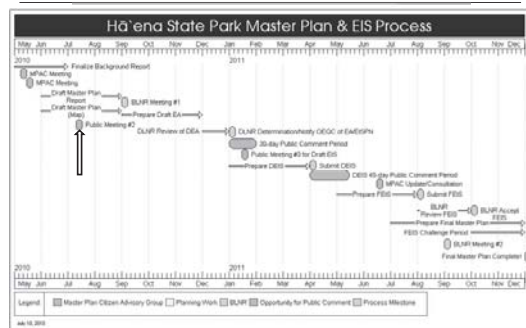

## Overview of Planning Process

- In the 1990's, a community-based plan was developed but not completed. The 1999 Community Preferred Master Plan is our starting point.
- Convened a Master Plan Advisory Committee (MPAC) for current effort to finish the master plan and EIS.
- Three MPAC meetings and a site visit held to evaluate, refine and ground-truth recommendations.
- Here today to present the proposed revisions to the Community Preferred Master Plan and proposed management strategies developed by the MPAC.

## Priorities and Vision

- ALL of the park is culturally significant.
- The park should be a living place... cleanse, restore, and make useful again.
- Involve the families who are originally from Hā'ena... reconnect the people to the place.
- Uphold State Parks' responsibilities... public safety and welfare, public access, and outdoor recreational opportunities.

## Process Overview

## Proposed Revisions to the 1999 Community Preferred Master Plan

***Proposed  
Management Strategies***

**OVERALL PARK MANAGEMENT**

- Advisory Committee preference: community-based hui manages the entire park.
- Other options discussed:
  - State/community partnership
  - State continues to manage park with available resources
- Advisory Committee preference is to have funds generated by entrance or parking fees support park management, facilities and programs.
- Cultural Advisory Group provides guidance to State Parks and community-based management hui.
  - Hula complex & sacred sites
  - Protocol
  - Any improvements, including safety & maintenance

***Proposed  
Management Strategies***

**PARK ACCESS AND PARKING GOALS**

- Ensure access for local community while managing volume of visitors.
- Access management should not discourage or diminish the experience for the local community.
- Keep it simple.
- Adjust over time as needed.

***Proposed  
Management Strategies***

**HULA COMPLEX**

- Management of the hula complex is a priority.
- Include education and enforcement of protocols.
- Management of complex must be included in management hui's responsibilities.
- Requires formal agreement between State Parks and County of Kaua'i (parcel's owner) to allow it to be managed as part of the larger park.
- Cultural Advisory Group should be consulted if interpretive displays are provided.

***Proposed  
Management Strategies***

**VEHICULAR ACCESS AND PARKING**

- Vehicular access along interpretive corridor for special access only - ADA, emergency vehicles, maintenance, lifeguards, cultural practices.
- Limit main visitor parking lot to 108 stalls.
- Consider having shuttles as an alternate means of access.
- Use parking fees and permits to control visitor numbers and turnover.
- Inform the public when parking lots are full.
- Provide options for kama'aina rates and annual passes.

***Proposed  
Management Strategies***

**PEDESTRIAN AND BICYCLE ACCESS**

- Interpretive Corridor primarily for pedestrians and non-motorized bikes.
- Delete public pedestrian and bicycle path that is shown on the 1999 Community Preferred Plan within agricultural complex and along sand dunes.
- Manage public access to ag complex, other sites through educational/interpretive programs such as educational tours, community work days.

***Proposed  
Management Strategies***

**PARK HOURS OF OPERATION**

- Vehicle gates open from dawn to dusk. Pedestrians and bicycles, cultural practitioners allowed.
- Close park to the general public at least one day a week.
  - Allow park to rest and resources to replenish themselves.
  - Closure day(s) could be used for park maintenance, community educational/work days.
- Hikers who park overnight must see Caretaker to unlock gate.

***Proposed  
Management Strategies***

**NĀPALI TRAILHEAD MANAGEMENT**

- Hiker check-in at orientation center.
- Consider dedicating a certain number of parking stalls for overnight hikers; charge a different rate for overnight parking permit.
- Guided tours could be organized by management hui, or if provided by a third party, reviewed by Cultural Advisory Group.

***Proposed  
Management Strategies***

**ORIENTATION/EDUCATION/INTERPRETATION**

- Provide orientation program for everyone entering. If sat through one time and sign in, don't need to go through it again for one year.
- Include interpretive displays to convey cultural importance, history, environmental information.
- Install interpretive displays at significant sites and throughout Interpretive Corridor, as appropriate.
- If shuttle service provided, there is an opportunity for orientation/education during transport.
- Locate signs with park rules/public safety information at the beginning of the Interpretive Corridor, Parking Lot and near Kē'e Beach.

***Proposed  
Management Strategies***

**NATURAL RESOURCES**

- Stabilize and restore dune system – mālama ‘iwi kupuna is first priority.
- Continue restoration of agricultural complex.
- Restore native forest – a healthy forest system supports all aspects of a natural ecosystem including water resources, soil stabilization, even ocean resources... deep connection to hula.
- Source construction materials, fill and compost locally to prevent import of invasive seed banks.
- Prevent spread of apple snails to Limahuli Stream.

***Proposed  
Management Strategies***

**FEDERAL LAND AND WATER CONSERVATION  
FUND (LWCF)**

- Outdoor recreation must be maintained within the park since land acquired by the State with federal LWCF funds.
- Develop and promote opportunities for public outdoor recreation that do not significantly impact natural and cultural resources.
- Proposed master plan will need to be reviewed by National Park Service to ensure compliance with LWCF requirements and original intent of park's acquisition.

***Proposed  
Management Strategies***

**RECREATION MANAGEMENT**

- MPAC recommended swimmers and snorkelers be located in areas visible to lifeguards.
- No suntan lotion on before entering water.
- Do not bother lawai'a.
- What you bring in, you carry out of the park.
- Picnic areas are needed within park but should not be located on dunes.
- Park master plan will defer fishing issues to Hā'ena Community-Based Subsistence Fishery Rules (nearing completion).

***Proposed  
Management Strategies***

**UTILITY MANAGEMENT**

- **Water System:**
  - Replace deteriorating pipes
  - Supplement with water catchment systems
  - Keep options open for restoring 'auwai, lo'i irrigation
  - Review and manage stream diversion for lo'i

## ***Proposed Management Strategies***

### **UTILITY MANAGEMENT**

- Wastewater System:
  - R-2 treatment system for new Orientation/Cultural Center and Caretaker's Cottage/Baseyard, use parking lot for leach field.
  - Evaluate different low-impact options for Cultural Gathering Area.
  - Reuse treated wastewater for landscape irrigation (non-edible plants).
  - Require regular maintenance at least once a year if not more.

## ***Proposed Management Strategies***

### **UTILITY MANAGEMENT**

- Electrical System:
  - Provide power to Orientation/Cultural Center and Caretaker's Cottage/Baseyard
  - Use photovoltaic to maximum use
  - Consider hydropower

## ***Proposed Management Strategies***

### **UTILITY MANAGEMENT**

- Drainage System:
  - Reinstate 'auwai, where applicable. This will help mitigate flooding.
  - Restore a more natural look to existing drainage facilities (drain outlets and inlets).
  - Use bioswales and other low impact designs to fullest extent possible.

## ***Proposed Revisions to the 1999 Community Preferred Master Plan***

### ***Discussion***

- Any questions or comments on the proposed...
  - Revisions to the 1999 Community Preferred Master Plan Map
  - Management Strategies

### ***Mahalo Nui Loa!***

- If you wish to submit comments or be added to our mailing list, please contact...
  - Lauren Tanaka, State Parks, 587-0293  
Lauren.A.Tanaka@hawaii.gov
  - Catie Fernandez, PBR Hawaii, 521-5631  
cfernandez@pbrhawaii.com
- Please submit comments by July 31, 2010.

***Mahalo!***

### ***Next Steps***

- Draft Master Plan Report
- Board of Land and Natural Resources (BLNR) Meeting
- Environmental Impact Statement (EIS) Process
- Finalize Master Plan Report & Map
- BLNR Approval
- Implementation...!

**MINUTES FOR THE  
MEETING OF THE  
BOARD OF LAND AND NATURAL RESOURCES**

DATE: THURSDAY, OCTOBER 14, 2010  
TIME: 9:00 A.M.  
PLACE: KALANIMOKU BUILDING  
LAND BOARD CONFERENCE ROOM 132  
1151 PUNCHBOWL STREET  
HONOLULU, HI 96813

Board Member Agor called the meeting of the Board of Land and Natural Resources to order at 9:05 a.m. The following were in attendance:

**MEMBERS**

Ron Agor  
Jerry Edlao  
Dr. Sam Gon

Rob Pacheco  
John Morgan  
David Goode

**STAFF**

Dan Quinn/PARKS  
Charlene Unoki/LAND

Michael Constantinides/DOFAW  
Randolph Lee/SHPD

**OTHERS**

Pam Matsukawa, Deputy Attorney General  
Cynthia Rezentes, E-2  
Bobby Titcomb, E-2  
Hans Sin, C-1  
Chipper Wichman, E-3  
Douglas Halbert, D-19  
Greg Kugle, D-16

William Aila, E-2  
Josh Horowitz, E-2  
Summer Nemeth, E-2  
John Morton, E-1  
Kimi Yuen, E-3  
Zachary Helm, D-19

{Note: language for deletion is [bracketed], new/added is underlined}

**Item A-1 September 9, 2010 Minutes – TO BE DISTRIBUTED.**

**Approved as submitted (Pacheco, Gon)**

Mr. Quinn pointed out to the Board that the recommendation as to the approval of the design is also to delegate to the Chair should there be required approval of components of the design.

This item was moved to approve by Member Morgan and seconded by Member Gon.

**Unanimously approved as submitted (Morgan, Gon)**

Member Goode noted this relates to the Chair having discretionary down the road here. That is fairly broad. They still have some permit processes to go through where there could be a fair number of changes. It's hard to say what is significant. He thought the Board and the Chair should have full authority to handle those. He is not sure how those issues are worded, but there will be changes and the Chair should be able to handle that. Member Gon said he would be happy to leave it to the discretion of the Chair and staff to decide whether it is significant and whether it should come back to the Board or not.

**Item E-3 Request the Board of Land and Natural Resources to Accept the Recommendations Proposed in the Draft Master Plan and Endorse the Preparation of an EIS for Haena State Park, Haena, Kauai**

Mr. Quinn reported that in the Board package there is some additional information for the Board members one of which was in a different format - easier to follow objectives and management strategies as well as a plan view of the park at Haena. He described where Haena is referring to the map. Over the past decades it has been subject to overuse where there are way more vehicles than the area can accommodate. The impacts are significant. Mr. Quinn orientated the Board members pointing out landmarks. There is a DOT highway that ends at the Ke'e Beach. There is a graded area used for parking that fills up completely where people will park along another area and along the highway. This area is rich in cultural and archaeological sites -- taro lo'i, house sites and heiau where there is a heiau deeded to the County of Kauai. Also, caves and rock fall hazards. He related some history where about a decade ago the State undertook a master planning process that was never effectively wrapped up. Unfortunately, the consultant left the State and they never got a plan everyone was happy with. Staff has moved to a new master planning process which will take us to the EIS, but the biggest problem is how to deal with the vehicles. This is one of the recommendations in the plan which calls for limiting vehicular penetration to a certain point other than allowing special access for ADA or cultural access to the hula heiau. The limit is calling for a 108 parking stalls which are about a third of the vehicles in there now. One concept was to have people park outside and have them shuttled in citing the example of Pirates of the Caribbean movie who had to park out in Hanalei and ran a shuttle system for the park visitors all day long that worked well and showed it can work. The issue is finding a parking lot which still needs to be addressed. There are a number of recommendations where one of the considerations is to have a gate to charge for parking or access to the area. The community would like to manage that themselves and retain the funding to help operate the park. That is not impossible, but it is on a scale staff has not done yet. They do have non-profit organizations managing parks. There certainly is some capacity building that needs to happen before that can occur. Also, there are proposals regarding limiting

access to the hula platform. From staff's perspective whether they can tell people if they can go into a place or not or have particular groups go to it is potentially problematic, but through an educational process and requesting people to have consideration for the site – this is something that could be done. Mr. Quinn related the concept of the plan pointing it out on the map where people will park in the colored area with an orientation center for visitors to be educated. Where the caretaker's facility is there will be an interpretive corridor with signage. Right now, there is a restroom and there is a project for constructive wetlands for disposal of the effluent and water that comes up from the ground. This area serves as the trail head for the Na Pali Coast where many of the cars parked there are going beyond the park itself. There are hundreds of people a day who park there to hike to Hanakapiai which is 2 miles in which is substantial. And being this is the end of the road people want to park and explore. There is almost nothing you can do physically on the site without impacting an archaeological or cultural resource which makes it a challenge to accommodate people on the site. Mr. Quinn said he would like the Board to review and approve the draft master plan and they will be moving through the EIS process noting some folks in the community would like this to move along. He thanked Chipper Wichman for taking the lead in community discussions.

Member Agor inquired about driving in and dropping people off. Mr. Quinn confirmed that pointing out the ADA parking area. Staff needs to maintain emergency access. There is a plan to move the lifeguard tower away from the road. There will be some discussion with DOT in managing the road since it ends right on the beach. Also, there will be some discussions with the County since they have no active management program at the heiau which staff considers a resource part of the park.

Member Gon acknowledged the importance and richness of this area with the highest density of important sites in any State park. It's a huge challenge since it's at the end of a road. He apologized that he will have to leave for another meeting at 11:00am and hope to come to a decision on this item. Mr. Quinn noted that they have an active community group out there restoring the taro lo'i making the park come alive and are passionate to do so.

It was asked by Member Agor who makes the decision on the funds and Mr. Quinn said it would be up to the Board.

Chipper Wichman testified and acknowledged that in this process he is serving as a community member. He is a 5<sup>th</sup> generation Haena resident and it's his family's kuleana (responsibility) to malama (care) that place. He is personally involved in efforts to bring forward a Master Plan which he has 30 years of records and he wants to see the process finish. Mr. Wichman related that this place is the piko of the most famous ahupua'a on Kauai made famous throughout the archipelago because of the relationship of Pele and Lohiau. The entire property is a wahi pana. There are iwi kupuna in the dune system there and archaeologists have noted the earliest dates recorded are from this area. This area was used intensively as a cultural site as any in the pai aina. As a cultural resource it doesn't get more intense and more responsible.

Mr. Wichman said there has been no management of the area by the State and so it has been over run. In recent years they were successful in getting the State to put up a gate to stop vehicles from driving on the dune system. The State has assisted their non-profit organization, Hui Maka'ainana O Makana who is the curators of the lo'i system. They took out an alien forest and now have kalo growing. The State Park's archaeologist assisted with mapping.

Mr. Wichman said there is a question with who gets the funding from the gate access. The community has been proposing a gate for 15 years because it's about managing people. There are too many people in the State. There are problems with rage parties at night where a gate would secure the park. It is a great idea to limit the vehicle penetration into the park – the area that is already disturbed. This planning process started with the community preferred master plan in the 1990s with many stakeholder meetings. What is before the Board is a good compromise. The community feels in the end the ability for the State to properly care for this area is best achieved through a formal partnership with the community through a non-profit lease or something where the community becomes the stewards of this park. The key to proper resource management is money and the community has said they want 100% of the gate revenue. They want enough to do the job properly because this park demands it. There was a proposal to completely close the park 1 day out of the week. The aina needs to rest since it is overtaxed. This park is an end of road destination, has a safe place to swim, but there is so much more than just that.

Member Agor commented that families bring almost everything with them and this area warrants this type of plan which he agrees with. Mr. Wichman said he learned a phrase "the 1 cooler rule" - separating the parking from the resource that the community thinks that is a reasonable place for the parking.

Member Agor asked whether the community asked to set a number of people there. Mr. Wichman said determining a proper carrying capacity is a dangerous road to go down citing Hanauma Bay as an example. At the end it was determined Hanauma Bay's carrying capacity a day is 3000 people which is a scary number for the Haena community. It was difficult to determine and the best way was through parking stalls. At anytime there could be 100 to 150 people – it's dense, but not overly dense. The community has struggled with the shuttle concept in Haena, but they are overrun because there is illegal parking. Having a shuttle could dump hundreds of people and the community would have to define the carrying capacity. People could still be dropped off at the perimeter and walk in. They need to look at the carrying capacity for the island and the north shore. The community is looking at this process to retake their park because most of them are not willing to take their ohana down there because it's so overrun with visitors. The community is concerned with all the illegal parking along the highway beyond the DLNR's control, but it will have to be dealt with. Member Agor noted that at Hanalei if there is no parking vehicles are turned away, but people walk in.

Member Pacheco said that on the Big Island at Manini State Park the community group had the same idea of a limited number of parking, but it doesn't work because people will

park all over the place and he encouraged Mr. Wichman to find another way. Mr. Wichman agreed it is the toughest issue and the community's feeling is no matter how big you build the parking lot it will never be big enough. They've had up to 2000 people down there. If people park further away they are less likely to stay longer or bring all their accoutrements. It won't end unless a carrying capacity is set.

Member Morgan asked how they came up with the number of parking stalls because he had a concern with planning for a parking problem. He has hiked there and to come far away and not be able to hike is a downer. Mr. Quinn explained that is the number of cars that can fit in the already disturbed area. That was the same number the earlier community preferred plan had dealt with which he pointed out on the map. He agreed that 10 or 20 more isn't going to solve the issue and closing the gates when 108 cars come in is going to have an impact that has to be addressed which is an issue.

Mr. Wichman said that in the 1990s with the Community Preferred Master Plan had 3 scenarios and it was the one with the smallest number of parking stalls. The other scenarios had greatly increased parking capacity. The issue the community is wrestling with is how many of those stalls are dedicated to people hiking to Na Pali or vice-a-versa people swimming at Ke'e? It was suggested dedicating a certain number of stalls for people wanting to use the trail. They were looking at increased fees for leaving your car overnight like \$150 rather than \$10 as an example. The overflow parking will have to be addressed in the EIS process. This is for the Board to endorse to move to the next step. The viability of a shuttle system and community entrepreneurship appeared this past summer. Part of it is education for visitors to use the shuttle at Hanalei.

Kimi Yuen representing PBR Hawaii testified the key is education agreeing the place is overrun suggested having a permit system on-line for parking. A designated parking stall reserved for you for a certain day and a lot of tourists plan it in advance. At the same time these tourists are educated about the place from the State Parks website. Set this up ahead of time and then you can have a 108 parking stalls work. Or an island wide shuttle system permit for all the hotels that State Parks could charge. Have a visitors center there where people go for orientation and control numbers there.

**Unanimously approved as submitted (Gon, Morgan)**

**Item D-18 Issuance of Right-of-Entry Permit to Monsanto Company on Lands Encumbered by Governor's Executive Order 3140 and Revocable Permit S-7582, Pulehunui, Kula, Maui, Tax Map Key: (2) 2-5-001:010.**

Charlene Unoki, Assistant Land Administrator at Land Division conveyed that Monsanto Company plans to do some testing during an 8 month period at the site. There is an existing well that has been capped. In the First Phase, they plan to install a submersible pump and pump testing. In the Second Phase, they are going in to measure the water level in the State well. Staff is asking this permit be gratis for a period of 8 months. Any information from Monsanto will be turned in to Engineering as well as the Water Commission.

**KAUA'I COUNTY HISTORIC PRESERVATION REVIEW COMMISSION**  
Lihu'e Civic Center, Mo'ikeha Building, Meeting Room 2A/2B

**MINUTES**

A regular meeting of the Kaua'i County Historic Preservation Commission (KHPRC) was held on August 6, 2015 in the Lihu'e Civic Center, Mo'ikeha Building, Meeting Room 2A/2B.

The following Commissioners were present: Chairperson Pat Griffin, Anne Schneider, Stephen Long, David Helder (*left at 4:58 p.m.*), Charlotte Hoomanawanui, Victoria Wichman, Larry Chaffin Jr., and Kuuleialoha Santos (*3:27 p.m.-5:15 p.m.*).

The following Commissioner was absent: Althea Arinaga

The following staff members were present: Planning Department – Kaaina Hull, Shanlee Jimenez; Deputy County Attorneys Jodi Higuchi-Sayegusa (*3:02 p.m.-4:33 p.m.*) and Andrea Suzuki (*entered at 4:33 p.m.*); Office of Boards and Commissions: Administrator Jay Furfaro (*left at 4:00 p.m.*), Support Clerk Darcie Agaran.

Prior to the start of the meeting, Council Administrative Assistant Eddie Topenio gave the Oath of Office to new Commission Member Larry Chaffin Jr.

**CALL TO ORDER**

The meeting was called to order at 3:01 p.m.

**SWEARING IN OF NEW COMMISSION MEMBER**

Ms. Griffin: We appreciate Larry joining us. Last month when Honey Girl was sworn in, she told us a little bit about herself and we introduced ourselves. If you all haven't done that, we'd love to hear that.

Mr. Chaffin Jr.: Thank you. I'm Larry Chaffin. I am a fellow of the American Institute of Architects; retired now. I've lived on Kaua'i for twenty-two (22) years. I came from Los Angeles, California where our firm worked in the seven (7) western states. And I enjoy life here. Thank you.

Ms. Griffin: Thank you. Victoria, do you want to introduce yourself as we go around?

Ms. Wichman: My name is Victoria Wichman. I work for State Parks.

Ms. Griffin: Thank you.

Mr. Long: I'm Stephen Long, Architect.

Ms. Schneider: Anne Schneider. I worked as a Planner here.

Ms. Griffin: Pat Griffin.

Deputy County Attorney Higuchi-Sayegusa entered the meeting at 3:02 p.m.

Deputy County Attorney Higuchi-Sayegusa: And Jodi Higuchi-Sayegusa.

Ms. Griffin: Our attorney.

Mr. Helder: David Helder, (inaudible).

Ms. Hoomanawanui: Thank you for coming and being here for this.

Ms. Griffin: Honey Girl Hoomanawanui.

Ms. Hoomanawanui: Honey Girl.

#### **APPROVAL OF THE AGENDA**

Ms. Griffin: With the approval of the agenda, if there are no objections, I'd like to switch items D and C, so that we take up New Business first and then Unfinished Business. With that, do I have a motion to approve the agenda?

Ms. Schneider: I make a motion.

Mr. Chaffin Jr.: I have a question on the agenda.

Ms. Griffin: Okay.

Mr. Chaffin Jr.: On Page 15, 6<sup>th</sup> paragraph, 7<sup>th</sup> word, what is the word?

Ms. Griffin: Let's see. Let's wait until the minutes on that because that's part of the minutes.

So you moved to approve the agenda.

Ms. Wichman: Second.

Ms. Griffin: Thank you. It's been moved and seconded to approve the agenda. All in favor? (Unanimous voice vote) Opposed? No, motion carries 7:0. Thank you.

#### **APPROVAL OF THE JULY 2, 2015 MEETING MINUTES**

Ms. Griffin: Now the meeting minutes. Page 15?

Mr. Chaffin Jr.: Yes. The 6<sup>th</sup> paragraph, the 7<sup>th</sup> word.

Ms. Griffin: Read it for us.

Ms. Wichman: Oh, that's my statement.

Mr. Chaffin Jr.: "But he was very..."

Ms. Wichman: No, I actually want to correct that because that's not exactly what I said. "It was very productive..." It was on Page 18 (sic), right? "But it was very productive to know the people from across the State", so that's how it should word on that page.

Mr. Chaffin Jr.: Thank you.

Ms. Wichman: And I also have a correction on Page 18 near the bottom. Where I'm speaking, near the bottom, it's the 8<sup>th</sup> paragraph. It says "we had Susan" and then it says "inaudible", its Susan Lebo, L-E-B-O.

Ms. Griffin: Thank you. Were there other changes?

Hearing none. May I have a motion to approve with changes?

Mr. Helder: So moved.

Mr. Chaffin Jr.: Second.

Ms. Griffin: Thank you. All in favor? (Unanimous voice vote) Opposed? Hearing none. Motion carries 7:0.

#### **ANNOUNCEMENTS AND GENERAL BUSINESS MATTERS (None)**

Ms. Griffin: Announcements and General Business Matters.

#### **COMMUNICATIONS**

Ms. Griffin: Communications. We got the one (1) that was at your place, and thank you for that as always, Staff. We appreciate that.

Other communications?

## NEW BUSINESS

**Re: Letter (6/26/15) from Ronald Sato, Senior Associate, HHF Planners regarding Environmental Reviews for Federally-Subsidized Public Hearing Projects Statewide, Section 106 Consultation – Preliminary No Adverse Effect Determination – ‘Ele‘ele Homes, TMK: 2-1-01:13 & 42; Hui o Hanamā‘ulu, TMK: 3-8-12:30; Kalāheo, TMK: 2-3-12:30; Kapa‘a, TMK: 4-5-15:07.**

Ms. Griffin: Then let's go on to Part D, New Business. D.1. is a letter from Ronald Sato, from HHF Planners, regarding the Environmental Reviews for Federally-Subsidized Public Housing Projects Statewide. This is part of the Section 106 Consultation. Their preliminary finding, you will have read, was that there is no adverse effect; not because these aren't quite fifty (50) years old because they will be in another five (5) months essentially. But on Page 3 of the letter, they state that Fung Associates has shown that there have been enough changes so that they don't have historical integrity at this point.

Are there any comments that you want to bring up for us to give a response to HHF? Has anybody been able to see any of these project sites?

Ms. Schneider: No.

Ms. Griffin: I'm wondering if we can ask HHF for Fung's response on where Fung Associates felt the loss of integrity had occurred and what has happened. I think that would help all of us to see what these character defining aspects of properties in general are of this era.

Ms. Schneider: Can we request a letter?

Ms. Griffin: Sure.

Ms. Schneider: Asking them to define what they think has loss integrity.

Ms. Griffin: Would you like to make a motion, Anne?

Ms. Schneider: I'd like to make a motion that we send a letter asking them to define what they mean by losing integrity and how many changes have been made.

Ms. Wichman: I second.

Ms. Griffin: Thank you. It's been moved and seconded that we send HHF a letter requesting more information on how they've defined the loss of integrity and what changes have been made.

Is there further discussion? Thank you. Hearing none. All in favor? (Unanimous voice vote) Opposed? (None) Motion carries 7:0. Thank you very much, and thanks to Staff.

Mr. Chaffin Jr.: Shouldn't it be attention to a certain person rather than just the firm?

Ms. Griffin: I'm sure that it would go back to Ronald Sato, the Senior Associate, who sent us the letter, too. Thank you.

**Re: Letter (7/17/15) from Kimi Yuen, Senior Associate, PBR Hawai'i & Associates, Inc. informing the KHPRC of the Draft Environmental Impact Statement (EIS) for the Hā'ena State Park Master Plan that has been prepared pursuant to Chapter 343 of the Hawai'i Revised Statutes and Administrative Rules, Title 11, Chapter 200.**

Ms. Griffin: Item D.2. The letter from Kimi Yuen, Senior Associate, of PBR Hawai'i and Associates informing KHPRC of the draft Environmental Impact Statement for Hā'ena State Park Master Plan.

I know Ms. Yuen is here.

Ms. Wichman: I need to say that I have to recuse from any statements on this because I work for State Parks.

Ms. Griffin: Thank you.

Please come up, and if you could introduce yourself for our hardworking transcriber.

Kimi Yuen: Aloha, Commission Chair Griffin and fellow Commissioners. Thank you for having us today. My name is Kimi Yuen from PBR Hawai'i and Associates. With me today is Alan Carpenter, State Parks Archaeologist. Actually I was going to ask, before we get started, we have a slideshow presentation to give you an overview of the project. I also have large prints of the maps that if maybe Kaaina can help us put up, I can use it in my presentation.

Thank you, again, for having us. I'll jump in while they get that up. I don't think the beginning slides are anything ground-breaking or earth-shattering.

Just an overview of our presentation, we will go over the meeting purpose, what we are presenting today, project background, the planning process and EIS process that we're going through right now, and then answer any questions that you may have for us.

So just briefly, again, we're here to provide an overview of the draft Hā'ena State Park Master Plan. We initially came before this body in 2008 when we kicked this project off. I would just like to say that it's been a long process, but I think it's been very meaningful and we've had very good conversations. I'll have a list up later about an advisory committee of community members, kupuna, local families that have been involved, including business and other community leaders. It's an extensive list of folks that have been involved, and participation has been great. I feel like the plan has come to a state where everybody is comfortable with it, and so we've moved forward with the EIS process. We are also going to follow-up on the pre-consultation comments this body had for us back in 2008, and then again, to answer any questions you may have on the process and the EIS moving forward.

Just some brief information. I'm sure all of you are familiar with Hā'ena State Park. It's the State Park that is located at Kē'ē, on the north shore. It is at the end of the State Highway and comprises of 65.7 acres. The majority of the site is State land, but the County does own a small outparcel of 0.68 acres where Ka Ulu A Paoa Heiau and Ke Ahu A Laka are located. The State primarily used Federal Land and Water Conservation Funds to acquire the property in 1977. What that means is that as the State moves forward and some of the management issues that have come up, they will still be required to abide by certain regulations and guidelines. It impacts things like entrance fees and that sort of thing, so there's a certain set of rules specific to the Federal Land and Water Conservation Funds that State Parks will have to abide by moving forward. Right now, the main reason we're here is that there's currently no adopted State Master Plan for the park or an accepted EIS, and State Parks basically needs that to move forward with any kind of major capital improvements at the park, which I think all of us know the park could definitely use some care and attention.

Just briefly highlighting some of the significant sites at the park. Of course, there's the heiau again and the hula platform. Lohi'au's house platform is also located at the State park, and an extensive agricultural complex containing lo'i and 'auwai, as well as a couple of loko that may have been, or thought to have been, agriculturally used, too. You have the two (2) wet caves; Wai a Kanaloa and Waikapala'e. Kē'ē Beach and Lagoon, which is a very popular visitor destination with roughly three hundred (300) people on the beach at any one time. Na Pali o Makana, which is a prominent peak that you can see from portions of the park, and then, of course, the trailhead to Kalalau Trail and the Nāpali Coast State Wilderness Park. Much of the park is included in the Hā'ena Archaeological Complex, which is a registered historic place on both the State and National Registers. It was placed there in 1984. The Nāpali Coast Archaeological District is primarily the area mauka of the highway, and that, too, was placed on both the State and National Registers in 1984. The highway itself, the north shore section of the Kaua'i Belt Road was put on the National Register in 2004.

Here's a picture of the existing site. You can see the extensive lo'i complex on the eastern portion of the State Park. The existing unpaved parking lot is here. The State highway runs along this edge at the base of the pali, and terminates at Kē'ē Beach. The heiau is located here and this is where the County property is located; the 0.68 acres. So you can see that it's actually landlocked within the State property. The two (2) loko are roughly in these areas. The site is heavily overgrown, but it used to be cleared, open, if you can imagine, expanse of coastal dunes along the shoreline. The two (2) loko were not covered over like they are currently, and of course the agricultural complex was actively farmed until the 1960's.

Alan, feel free to jump in if there's anything.

So the 'auwai are these little dotted lines that you see running throughout the lo'i. Back in 2008 when we were here, actually it was just me that was here before you seeking any input or thoughts that this body had as we kicked off the project. There were basically six (6) main issues that were brought up, and one was the National and State Registers, which I just went over earlier that much of the site is actually already on both registers. A comment came up about the relationship of proposed trails to the cultural resources and the cultural practices that occur at the park. Fishing

zones, an interpretive program, maintenance and management of the overlapping State and County jurisdictions, and then mapping of buffers of specific resource preserves within the overall complex.

I'll let Alan talk about this slide, but basically we asked Alan because State Parks has archaeologists on staff, they did the archaeological overview, survey, and mapping for us. This is one of the graphics in both the Master Plan and the EIS.

Alan Carpenter: Alright, thank you Kimi. Thank you, Commissioners, for having me here today. So this essentially is an outline of the park property. As Kimi mentioned, as most of you probably know, Hā'ena is an extremely important historical place; a very storied place associated with import persons and legends, and that manifests itself on the ground, in terms of physical remnants. When I was asked to put this map together to sort of outline where the significant resources are, you can see that each of the colors represent a different site type. Effectively, the entire park is covered by sensitive archaeological sites. Most notably in the dark green, in the white outlines are the actual mapped lo'i bank walls; that's a very large and extensive irrigated agricultural system of lo'i. As Kimi mentioned, it was farmed up until the 1960's and has more recently since the 1990's been revitalized by the Hui Maka'aina o Makana, a curated group we have out there, and they have, again, begun planting and restoring a section of the lo'i system. And that's a prominent part of the park landscape today.

The two (2) loko; Loko Naia, Loko Kē'ē. Loko Kē'ē still functions somewhat as a pond. It has standing water at most times, though it is infilled. Loko Naia is dry. It no longer has a pond element to it, but it was there historically; most likely a combination of a lo'i and a fishpond.

The yellow areas are the beach dune system. That area is noted of course as an area where people were buried. There have been a number of burials that have come up to natural reasons and one, due to park development in the last few decades. There are historic cemeteries as well. They are hard to see, but right here is one (1) with historic grave stones and right here is another one (1) that may or may not be. It appears to have grave markers, but we're not 100% sure. But the entire dune is considered sensitive as a potential area of burials. So we consider that as one (1) of the more sensitive places. It has conflicting uses because that's also the shoreline where most people want to go and visit. The yellow areas on the mauka side of the road are legendary sites. The wet caves, Wai a Kanaloa and Waikapala'e, are these two (2) areas here. This is Lohi'au's house site, which is a very large platform with unique architecture. A pretty stunning feature, but again, kind of hidden away in the bushes.

Ms. Santos entered the meeting at 3:20 p.m.

The area in blue, that's mostly the highway, but also at the end of the road, this is the historic Allerton house complex and gardens. It's actually quite modified. It had two (2) homes; previously owned by Francis 'I'i Brown, I believe, who may have built the homes. One (1) of them burnt down around 1990. We still have the Caretaker's Cottage, which is a 1920's structure. We hope to restore that as part of the park landscape and also adaptively reuse it for park purposes.

And the last area to discuss is...I'm sorry, this is other blue one. This is another historic homestead area where people lived in the early 1900's.

The area in red is effectively all the area that has modern disturbance, so that is essentially the only disturbed areas, and that really shows how constrained we are with being able to do any kind of park developments without disturbing historic features. So the main area where the current parking lot is, this is going to be the focus of all future development. This area here represents disturbance from the Taylor Camp days in the 1960's, but there are still remnants of the lo'i despite that disturbance. This is simply a road that accessed another historic house which is still there; the Montgomery House, again, built in the 1930's, and another one that we intend to hopefully restore and preserve. This is the area most recently developed by State Parks in the 1970's. That did impact some subsurface cultural features, mostly habitational features, but also one (1) burial. In a nutshell, this is a very challenging place to propose development and manage herds of people.

Ms. Yuen: Just to add to Alan's wonderful overview, this central area is right in the middle of where the Hui is actually...this is the area that they've restored and are currently farming. But this area, Alan if you can correct me, they would not restore this as lo'i because there were a lot of abandoned cars, and it just would not do well as restored lo'i. So that's why this small area of the lo'i is called out as "red" because they wouldn't ever restore it.

Mr. Carpenter: Yes exactly. Due to the nature of irrigated agriculture and pond fields, especially for kalo, if you fill those with water to cultivate, down below the surface there is a lot of glass and metal and other things it that are extremely difficult to remove, so that will probably remain as some kind of use area or perhaps dryland, but it's not going to be restored as far as a lo'i system.

Ms. Yuen: So this is a list of our Community Advisory Committee members.

Mr. Carpenter: Which you've seen four (4) to five (5) times already. (Laughter in background)

Ms. Yuen: Like I had mentioned earlier, it includes a wide variety of kupuna and Hā'ena 'Ohana members. We have cultural practitioners, such as Kumu Hula Kehaulani Kekua, on our advisory committee, as well as many of the local businesses and community leaders on the north shore involved in the process. We can leave a copy of this for you folks. This is also in our Master Plan Report as Appendix A. I think some of their titles might actually be outdated since it's been such a long process; we probably have to add like two (2) or three (3) for some of them.

So this is the view of the current draft Master Plan. Again, we brought larger prints that are up on the board. So I'll just kind of go over a lot of the highlights of the plan. Maybe it'll help if I can walk up to the printed one and point as I...

Again, to give you some orientation, of course, the shoreline is on the top side of the image. The pali is on the bottom of the image. The highway running at the base of the pali; the heiau. So the thought is that traffic and access will come from the highway primarily. At the main entrance...because this is technically the end of the highway, we included a turnaround so that cars that aren't actually going to the park, but actually want to drive to the end of the road can do

that without backing up traffic as it currently happens. We divert the traffic into a parking lot, and I'll explain in a little bit why its bent in this fashion, but the main reason is that as we had go along in the plan and it's probably a big reason why our finalization of the draft Master Plan got delayed a bit, was that State Parks and DLNR had undergone a Rockfall Hazard Study for this stretch and found that actually the highway lies in a pretty significant rockfall hazard zone. So what that ended up doing was we had to reconfigure this entry portion of the Master Plan because we were putting some of the main visitor facilities right within that zone. I have a map coming up and it's actually on this, but we'll show the different rockfall hazards. But on this plan, it's the little dotted line. What we did was locate all of the visitor facilities outside of that, and this is a modeled rockfall hazard, kind of, predictor of where the rocks are likely to fall. So this was the point of 0% chance of rockfalls, so we tried to locate everything outside of that and outside of that rockfall zone. The advisory committee actually came up with that concept. What that does is, the highway no longer becomes the main access for people to get to Kē'ē Beach. We are recommending an elevated boardwalk that actually goes over the lo'i and cuts up towards this hau thicket, and then out to Kē'ē Beach that way to get them out of the rockfall hazard zone. The highway, we've talked to State DOT and they are perfectly happy turning it over to State Parks to maintain, but the process for that has not quite been done. The reason for that is that we want to basically limit the amount of traffic that is falling in this area. So what this becomes then is a special access or very limited access roadway. We have a small thirteen (13) stall parking lot at the end of it that we'll maintain, including two (2) ADA stalls. So that would be the primary access for the ADA access to the beach, as well as for cultural practitioners and any kind of hālau groups that may be going to the heiau; that becomes their special access to get there. I think we're also talking about fishermen and fisherwomen; they will be able to still use that as a special access. For the most part, the main bulk of your visitor traffic will be diverted to the main parking lot here. We sized it in this plan to be one hundred (100) stalls, which is what was shown in a previous Master Plan that State Parks had developed with a different consultant, back in the 90's. That plan and draft EIS was never finalized, so we came in back in 2008 to try to finish out. Basically, the base of this plan was based off of what was termed a community preferred master plan, but there were issues that people were still uncomfortable with, such as...actually that plan had dispersed visitors all along the coast line, thinking that would minimize impacts, as opposed to being concentrated in one (1) place. But that concept you know, this is not exactly the safest place to swim, you don't have any lifeguards, so that idea got taken off the table. They had actually located picnic tables along the coastal dune, which we didn't think was appropriate, so that is all gone. Now we are proposing restoration of the coastal dune. The advisory committee had made a good point that not only would they be taking care of the environment, but they would also be taking care of the kupuna that are there.

The previous plan had bike paths where the 'auwai was throughout the complex; we took that out. Really what we're doing is trying to focus the visitor traffic to the main entry parking lot. We have a visitor, kind of, welcome center right at the entry point, so we are focusing the visitor traffic along the elevated and it would have rails along this boardwalk to the hau thicket, and then from there a path directing folks to the beach. What this does is it provides a view, actually, of the lo'i that currently people don't get to experience, and it also opens up views of makana, which is...I don't think it's up here, but it's the peak is on this side, so there's a little viewing platform here that they could actually see makana now, where they can't see it from the highway. It helps bring out opportunities to interpret the sites that currently may not exist.

We worked really closely with the Hui that is restoring the lo'i. The discussion points were that because this section of the lo'i is at the base of the pali, it actually is some of the least productive areas of the lo'i. The concept is to then, you know, maybe this becomes places where visitors can actually experience lo'i firsthand; maybe they get in there themselves and can have hands-on kind of experiences within the park. The Hui would actually start to work on the later phases. Phase I actually continues here. These phase numbers relate to a restoration plan that Alan had worked on, I'm not sure how long ago, but the idea is to basically, eventually restore all of the lo'i at the park. What that does is allow the Hui to continue their work on the later phases of the restoration, but then also open up opportunities where visitors to the park can experience it as well.

This entire portion that is dashed out around the heiau, we've designated as a hula complex. That in and of itself would require its own, kind of, planning, probably an advisory committee to decide what and how that is, but the idea is that this becomes a place for hula practitioners.

In this middle part, we have what we've called a cultural gathering place where we would be proposing an open hale style learning center; Hālau Wa'a, for canoes since it's right along one of the bigger 'auwai that goes out into the channel. If you can see these little dotted lines throughout the lo'i, those would be limited to pedestrians only, and then things like guided tours might be able to access and have a connection back to the main visitor center there.

We've left the historic cemeteries as is and kept this historic road; that's what you see here dashed out. We haven't done anything to the comfort station and constructed wetlands that are currently there and completed, but the thought was because this is such a sensitive site, at the entry point we would be providing a second set of comfort stations. Hopefully what that does is it minimizes the use that actually happens out there because people would be using this as well, so the amount of runoff occurring at Kē'e would be lessened.

This little structure here is a caretaker's cottage that was envisioned in the previous Master Plan and a 24-hour presence; somebody actually hired by State Parks to oversee the park twenty-four (24) hours a day was a recommendation from that plan that's carried over to the current plan. You'll see things like this little dashed box. The Montgomery House is another one, but those are archaeological or historic sites recommended for restoration.

At the turnaround, we've identified it as a potential shuttle stop as well, and I'll go over some of the transportation plans and alternatives that came up through the meetings as well. For the most part, the primary focus becomes restoration and protection of the natural cultural historic resources throughout the park. The parking lot, actually Alan, if you could advance the slide, we're showing another plan of the entry area. If you can see, the turnaround is very similar, the parking layout is the same. There's a much more modest welcome pavilion at the park entry, and then the boardwalk carried over. But the concept here is to start small because State funding can be quite tight, and so State Parks asked us to come up with a near-term plan that could be, maybe you know, take a smaller bite of the big nut of the full Master Plan and what could be done to implement some of the concepts, such as the visitor limit which I'll go into a little bit as well. Graphically, we tried to show that one (1) of the main concepts of getting people to the park talked about a remote entry at Princeville. Putting a lot of the parking outside of the park.

Ms. Schneider: Can I ask where that's going to take place in Princeville?

Ms. Yuen: Where? I mean there are a few sites we identified in a Transportation Plan that's in our Master Plan.

Ms. Schneider: Because there's no parking in Princeville now.

Ms. Yuen: Right, right, exactly. But there is a site, there is a landowner that has offered up a site, so there's a community group that is working on that. It's one of those things that we'll need a lot of funding. It might require County, State, and Federal entities to partner on that, but there is a site that's identified in Princeville. It's a potential site that would hold probably 200-300 parking stalls, I think is what they estimated at. In any case, what we're showing here at least, if there was parking to be on-site, there's a roughly one hundred (100) stall parking lot.

The major management recommendation that came out of the group was to limit the visitors in the first place. You've got over 2,000 people coming at the peak on days; just one (1) day alone; 2,000 people coming to this park and it's just too much. Back in '93, the estimate of visitors, I think when you first started that earlier round of master planning efforts, it was only 350 people a day. So you can see, over a very short period of time, the number of visitors that are coming to Hā'ena State Park is quite significant. The first issue would be to reduce the number of visitors that come to the park on a daily basis; that would include folks going on the Kalalau Trail. But the idea is that you would have a flexibly sized parking lot, depending on what kind of transportation alternatives could get worked out. The County has been working on a north shore shuttle that they've been trying to get off the ground as well.

Ms. Schneider: That's already failed.

Ms. Yuen: Well, yeah I mean, the entity is still there, but I don't think the energy and the interest has yet, so I don't want to give up on that either. I think it's still a potential and I know the County is planning to do a study on a north shore and south shore shuttle. We're kind of keeping those options loose at this point, but the idea is that we won't overbuild a parking lot if some of these other solutions can work. If it doesn't, at least State Parks has, in their Master Plan, a one hundred (100) stall parking lot identified. The preference was to pave it with a permeable surface, which is why it's colored the way it is. Initially, it could start off with Phase I that lighter tan area, and you could keep the part in green as kind of an open lawn or grand lawn that you could have events or hold educational events or even community events in this space.

You have a more modest welcome pavilion, but again, the boardwalk would be an integral part of implementing this near-term plan.

If you look near the highway, you'll see a red line and a green line. Again, those are the rockfall hazard zones. The red line was where a 5% chance of a rockfall event might happen, and the green line is the 0% chance. Everybody just decided that rather than try to come up with some engineering solutions along the cliff, the advisory committee's priority was to preserve the cliff

and not impact the cliff with any kind of engineered solution; let's just move everybody outside of that zone. Even members of the Hui felt that that was a better way to go.

Again, to go over some of the key management recommendations that came out of the plan as well, these four (4) were seen as critical to being implemented no matter what the park ends up doing. I think when they are looking at transportation, entry fees, all that kind of stuff, that's still up for debate, but these were the four (4) that everyone agreed needs to happen, regardless of what other management decisions are made. The first one is to create a cultural advisory group and a broader community advisory group. It would be something similar to the advisory group that we had for the Master Plan effort. I think we would open it up to them to participate as well, but that's not to say that they will be the ones on this community advisory group. The cultural advisory group would be much more specific and require people with actual expertise in the different cultural, you know, there's fishing, there's hula, there's agriculture, that sort of thing, so very specific cultural advisor for State Park. The second item, again, is the initial daily visitor limit of nine hundred (900) people per day; that would include everybody going to the park or day hikers on the Kalalau Trail. This does not include the sixty (60) camping permits for the overnight further down on the Kalalau Trail, it would not include the thirty (30) hunter permits that are allowed, it would not include cultural practitioners, it would not include any kind of special hālau or lo'i work groups, school or educational groups, fishermen, or the cemetery caretakers. The discussion was to see what the impact would be over time; let's set a number at this outset and see what the impacts are to the park. If it continues to be a problem, they could adjust it down, as well as if it seems like there might be an ability to increase it that is still on the table as well. The idea is to at least set an initial daily visitor limit, which is less than the current number, but again, it is still higher than what was happening in the early 90's. But the idea is to see what the impacts would be to the park.

Mr. Helder: Would local residents have to apply for a permit to go?

Ms. Yuen: No, you wouldn't apply for a permit, but you would have to, basically, plan your trips. There will be tickets, and whether they charge a fee for it or not, and whether residents get charged or not, I think that's still open.

Mr. Carpenter: Actually, we've already gone out to the community, so residents are not going to pay entry or parking fees under a previously vetted agreement between us when we went out for fees statewide a couple of years ago. We're actually in the process of codifying our existing and proposed fees in our administrative rules; that's going to happen, actually, in the next couple of weeks. So any fee will apply to out-of-state visitors, but not to locals. But if we set a limit, there has to be a way to have a control point or a system for adhering to that limit.

Mr. Helder: So if you lived in Wainiha, for instance, and you wanted to drive out there.

Mr. Carpenter: Yes, that's one of the challenges and there are other things that could come into play. For example, the peak times, you may limit the peak times, but guys who need to go out and fish early in the morning or people who want to go at night when there's really not a capacity issue, everyone is already gone, those may be totally open and available. At least that's one (1) of the

things that I think would be imperative to the local community because you can't plan the nice days or the days when the akule are there, that kind of thing right, so it will be a challenge. There was an overwhelming desire by the advisory committee to set a limit, essentially because visitor experience is being impacted and particularly, local visitor experience is being impacted by the absolute crush of people heading to the end of the road.

Mr. Helder: I understand that, but when you live out there that makes up a large portion of where you have to go. You're basically limiting accessibility for people that live there.

Ms. Hoomanawanui: That's true.

Mr. Helder: That's a problem.

Ms. Hoomanawanui: You're right.

Mr. Helder: That constitutes a taking, really, of what we have out there.

Mr. Carpenter: If you're fishing or you're practicing culture, you're not beholding to these limits. So that may be a challenge to prove or I mean, you figure, just considering how it would actually operate. It's probably going to be a bunch of people familiar with the area and locals or a community group, possibly even, running this under some kind of agreement. They are going to know the difference between someone from Minnesota and someone from Wainiha.

Ms. Schneider: I think that's part of the problem here now. The beaches, everywhere is so crowded that there's no place for the local people to go anymore.

Mr. Helder: Yeah, and it's what it sounds like, it's another...

Ms. Schneider: And we keep catering to the tourist experience, rather than to the local experience.

Mr. Helder: Yeah.

Administrator Jay Furfaro: Excuse me, Madam Chair. May I recommend that you finish the presentation and then go into a recognized Q&A afterwards?

Ms. Griffin: Thank you.

Mr. Carpenter: Okay, thanks.

Mr. Yuen: The third key management recommendation was to require a visitor orientation prior to park entry. That is simply to educate anyone who comes to the park about the sensitive natural and cultural resources there. Especially if you are a local resident, you would only have to do it once, and after that you would be cleared of having to do it again. So there's different types of ways to implement that, but the idea is that, you know, because of the conditions that can turn on a dime in this environment, it's imperative that anyone who goes there knows the potential range

of hazards that are out there and be aware of them. It could also include things like daily weather reports; whether there's potential flash flood warnings or that kind of thing. Basically the idea is to help educate anyone who goes out there because it's not only the tourist, but there may be Kaua'i folks that aren't familiar with the conditions out there, too, that may require some education. And then the fourth one is to require Staff and Volunteer education since they are at the front lines of any kind of visitor interaction; whether they are local or out-of-state.

To just quickly go back over the issues that were raised by this body back in 2008, we did go over the National and State Registers. Again, the relationship with the trails to cultural resources and practices, the idea is to focus visitor traffic on that boardwalk and get them safely to Kē'ē outside of that rockfall hazard zone and open up the views of the lo'i and makana. And again, it will not preclude cultural practitioners' access to the sites because we will have the highway remain as that limited access corridor. Even the hunters, we were talking about being able to park at the parking lot at Kē'ē. Fishing zones, the Master Plan basically defers to the Hā'ena Community-Based Subsistence Fishing Area rules that were just adopted by the Board of Land and Natural Resources in October of 2014 and recently signed by the Governor; I think that was just Tuesday. So rather than having an overlapping set of rules or concepts, the group just decided to defer to those area rules that are now signed into law. Interpretive program. The entire Chapter 5 of our Master Plan report goes over a proposed interpretive program. And with Victoria Wichman now on staff as an Interpretive Specialist here on Kaua'i, that would probably fall under her purview for implementation. Maintenance and management of the overlapping State and County jurisdictions. It had gone back and forth in a lot of different discussion and concepts, but currently, the County actually has a stewardship agreement with the Hui to manage that site. I don't know if Alan wants to elaborate on any of that.

Mr. Carpenter: Actually, they have two (2) agreements. The Hui has an agreement for the lo'i, and they more recently have an agreement, since we started this process and you ask actually, the County has started their own program with the great support of the Mayor and they have, how many? Three (3)? Or just two (2)?

Ms. Wichman: What? (Inaudible) agreements?

Mr. Carpenter: (Inaudible) agreements under the County.

Ms. Wichman: Right now, officially, one (1).

Mr. Carpenter: Just one (1)?

Ms. Wichman: Yes.

Mr. Carpenter: Plus this one?

Ms. Wichman: Yes, they are working on this one. Kaneiolouma is the first one.

Mr. Carpenter: Right.

Ms. Yuen: This one actually hasn't been signed.

Ms. Wichman: I really couldn't answer that. I don't know.

Administrator Furfaro: This one hasn't been executed yet.

Mr. Carpenter: It has not yet? Okay, so still in the works.

Mr. Yuen: But that's what the County...

Administrator Furfaro: That's No. 2.

Mr. Carpenter: That's No. 2, alright. The last one, the mapping and buffers of specific resource preserves in the overall complex, that is included in the plan, but I just want to add from my perspective. The issue of buffers around archaeological sites is a development driven rule within the Chapter 6E, Historic Preservation Law. I prefer to flip that back to the opposite where what we like to do within parks is preserve everything, and instead our buffers should constrain the amount of construction that goes on, so that in fact we put a buffer around where construction activities can occur, everything outside of it is actually preserved. But the buffers, in this case, will be barriers to roadways, trails, vegetation, and things like that. It's not the same concept as you see when someone develops a hotel complex and they put buffers around the burial sites and the heiau because that's all they are required to preserve. We try to preserve everything, so we're kind of doing the opposite.

Ms. Yuen: So if you remember the map that Alan had shown where we had those red areas of disturbed areas, we really tried to keep anything we are proposing to those disturbed areas that could never really be restored.

Quickly, the EIS process, and I think some of you may be familiar with this, but an Environmental Impact Statement is a significantly more intense document than a standard Environmental Assessment. Really, with this project, there are so many triggers that we just decided that an EIS is probably more appropriate for this project because besides the use of State and County lands, you have area within a shoreline, historic sites, it's a conservation district, and there's actually an existing helicopter facility within a conservation district, shoreline area, and registered historic site that we are actually relocating, just a tad, in the plan from its existing site. Again, the EIS is not the actual permit. State Parks will still have to come back for their actual development permits, should they move forward on any of the construction projects, and this is just a list of them. I won't go over them in any detail, but again, the EIS is the disclosure document and where potential impacts are vetted and mitigation is proposed as part of what is being proposed in the Master Plan. So when they actually implement it, a lot of the mitigation concepts that come out that are brought up by community members and the public are rolled into the EIS. With that document, State Parks now has a good basis to really make sure that when they do move forward with implementation, they are taking into consideration all of these mitigation measures.

This is just a quick overview of the EIS process. The EIS prep notice was completed back in February and March of this year. We are currently in the draft EIS stage with the public review and comment period open right now. It closes on September 8<sup>th</sup>. After that, we will move forward with revising the EIS and incorporating all of the comments that are received. Then, the final EIS is accepted by the Governor, unless he so decides to delegate that authority.

So if you had a chance to look at our document, this is just a kind of quick overview of the organization of the document itself. If you decide to delve deeply into it, or if you don't have the time to really delve deeply into it, the first two (2) sections, the project overview and Section 1 include the Master Plan summary, as well as the summary of all of the impacts that are discussed in the later chapters. Chapter 3 is a description and more detailed assessment of the potential impacts and mitigation measures to the natural environment. Chapter 4 is those impacts to the human environment. Section 5 is conformance with the regulatory laws and guidelines and policies. Section 6 describes the alternatives we looked at as we went through this process. (7) is the contextual issues, and much of this is the requirements of doing an EIS document, so it gets more technical as you get further into it. The 8<sup>th</sup> is just the list of agencies and individuals we consulted with. (9) is the list of preparers, references. And then the actual comment letters we received during the pre-consultation period and the EIS prep notice period are actually attached in the last two (2) chapters with our responses to those written comments.

So just a quick overview, we've distributed the draft EIS to quite a few public agencies, as well as individuals and community groups. Copies were also provided to the media and the public libraries, including Princeville Library, the Lihue Regional Library, and Kauai CC Library. Technical studies that were done for the EIS are also attached as appendixes, which is why the document gets really long and voluminous, but these are attached as appendixes to the draft EIS. And then the remaining project timeline. We're hoping to get through the draft EIS with the September 8<sup>th</sup> comment period deadline, revise it, and submit to the Governor and OEQC for review by October. Then, it actually goes to the Board of Land and Natural Resources for their review of the final EIS, and then again, it has to go back to the Governor for final acceptance, and then OEQC actually publishes it. After that, we will be finalizing the Master Plan itself, which would also require Board of Land and Natural Resources approval.

With that, do you have any questions for us?

Administrator Furfaro: Madam Chair, before you open the questions to the members, may I have a moment as I'm leaving to go to visit with the Mayor for another meeting?

Ms. Griffin: Of course you may.

Administrator Furfaro: Thank you. First of all, I'm delighted to see the presentation, but I wanted to just give some clarity here. On the Princeville shuttle bus, that issue is not dead. I do want you to know the Mayor launched a new committee of which George Costa and myself both got anointed to be on the committee, probably because of our visitor industry experience. So we've launched the original meeting with the resort operations at the Princeville site. And Lee from Planning and

Public Works is really our transportation guy, so just to answer that question, it is trying to be reestablished; just for general information.

I also want to say that our committee is also looking at options with landowners for the acquisition of property. We've been in touch with both the Federal and the State offices. That is in reference to your comments about the alternative parking location up on the north shore. That's being coordinated with the fact that we're still trying to get information as to what will happen with the Kilauea Lighthouse and those visitor centers, so there are things going on. What we're hoping to hear from the Planners also is there is a component of this land that's missing, and obviously they touched on it, on the financial aspect; fees and costs associated with general operation, stewardship, and so forth. So I just wanted to give you that piece of information, so that Chairwoman, you knew that (inaudible) going on along that way. And again, to remind you that your task is really to focus on the historical aspects of the plan and that stewardship. I'm sorry I have to leave, but thank you.

Ms. Griffin: That's alright, and thank you. And it's good to get an overview of the transportation, but I did want to remind this Committee (sic) that our kuleana is the historic preservation aspect. So transportation, who the Caretaker is going to be, where the engineering is, is outside our purview, unless it relates directly to historic preservation. What I'm going to do is ask you all to have questions, if you do, to Ms. Yuen or Mr. Carpenter. Then, I'm going to open it if there's public comment, and then we'll have further discussion, and make a decision on how to proceed. Thank you, again.

Mr. Furfaro: Again, I want to apologize for interrupting, but the discussion without a rules of following makes it very difficult for the Staff to record the meeting, so that's an apology from me for reminding. It's better to have speakers recognized when Q&A is proposed.

Ms. Griffin: Thank you.

Administrator Furfaro: Thank you, Madam Chair.

Administrator Furfaro left the meeting at 4:00 p.m.

Ms. Griffin: Are there questions of Kimi or Alan regarding the presentation?

Mr. Helder: I'm still having trouble with this, the restriction of use and...

Ms. Griffin: Excuse me, David, unless you can specifically say why that is affecting the historic preservation.

Mr. Helder: Cultural access. Cultural access has been historic for people here to be able to go out there and have whatever, whether they're a practitioner that is recognized by doing hula or standing out there and playing a 'ukulele. I don't care what it is, when you describe the accelerated use of the park that's causing an environmental impact that you're trying to mitigate, that accelerated use is not by the people who live here. It's by increased tourism that's promoted here. When you start

saying, if I'm standing out there and I want to go out and play my 'ukulele and I'm not allowed to because the limit has been reached of tourists, it means that my access to that park is restricted because you've promoted the use of tourists over the people that have been here and have traditionally been able to go out there, and practice whatever it is that they want to practice, in preference to tourism. So I understand; I live near there. It's a place that I go regularly and under the plan that you've just described, I would not be able to. There would be no spontaneity in what I would want to do as a resident here. And that representing from where I live, that represents probably 25% of what's available to me near where I live. So what I am really seeing here is it constitutes a preference by the State Parks system, under which you've designed here, for accepting tourism at the expense of the residents of Hawai'i and Kaua'i, right here in particular. I don't find that acceptable, to tell you the honest truth. I don't know what you want from this particular body, an acknowledgement so that you can go forward and check this off, but I don't agree with what I see.

Mr. Carpenter: Okay. I appreciate that. If I may, it's certainly not the intent to limit any local or cultural access of this. I'll back up and say that this plan represents a tremendous collaboration between the State and the community, particularly as expressed through the community advisory group, and both the limits on the number of people and the limits on parking were not anything proposed by our side. Those came 100% from the local community. In fact, we had many long discussions and debates, and I think we would have been very disingenuous inviting the community to give their input and then ignore it. This isn't completely vetted yet, nor is the solution as to how to implement it clear, but we gave the community their say and we accepted their recommendations, and that became embedded in this plan. The big public meeting where it goes out to everybody else is coming up, and that's going to be a time when I'm sure we are going to hear plenty, but I think the public is also going to hear from those in the community and their reasons behind the decisions they made to put that in.

Ms. Griffin: Hang on because if there are other questions, specifically on the presentation, we can take them, but then I want to open it to anybody in the public who wants to speak, and then we can come back and discuss. So are there other questions?

Ms. Schneider: Could I ask where it is in relation to the plans for Koke'e? Is this going to come first? Or is Koke'e going to come first? Because you have a master plan for Koke'e.

Mr. Carpenter: I don't know which is going to come first. Depends on where the funding comes from and the priorities of the Division. I can't say for sure which one is going to come first. They are both, kind of, proceeding concurrently. We don't have a whole lot of extra money for either.

Ms. Schneider: I would just like to say, as a business person in Hanalei for 25 years that I really object to this plan.

Ms. Griffin: Okay.

Ms. Yuen: I do want to add to Alan's comment about the visitor limit. I made the point that because the State acquired the lands with Federal monies, I mean, we wrestled with that like can

we let the local guys go unlimited and just limit visitors only to the park? But because it was acquired with Federal monies, we cannot discriminate somebody who lives in Hawai'i even, much less somebody from Kaua'i, from somebody who is from the mainland. So that is something we are wrestling with in figuring out how to implement this visitor limit, but the idea was that this would just be a first cut, we would let local practitioners continue to use the park, and see what happens then. I don't think we've defined it necessarily, and that may have been on purpose that we weren't overly specific about who can go, who cannot, but the idea was that we are trying to keep it loose enough to respect the local community that still wants to go, and like Alan said, maybe in the mornings and evenings there's no visitor limit; it's only from the peak hours that that number counter starts. But there are a lot of different ways that State Parks can actually implement this and that's why it's a management strategy. It's not something that's set in stone. It's something State Parks can adjust if it's not working. If the local community says like after a month, I still cannot get to the park, this is not working, and State Parks takes a look, well the environment, the experience at the park has changed with even that initial reduction, you know, hey maybe that gets adjusted. But the idea is to creatively come up with a way to, I mean, like I said we cannot discriminate between locals and non-locals, so how can we reduce that but still respect those who live in the community who still want to go to the park whenever they want without clearly saying the 900 only applies to out-of-state people or something to that effect. State Parks has to be very creative on how this gets implemented, but the idea is and like Alan said, the intent was never to reduce the number of local visitors. In fact, the whole point of why it was instituted, according to the advisory committee, was that local people don't even go now because it's not someplace they want to go; it's just overrun, they just don't want to be there. So the first thing that needs to happen is the period of ho'oma'a; let the park rest, let nobody in for a week. They're talking about just trying to get everything back under control, start at some point, you know 900 came up because it was less than half, it seemed like a reasonable number based on historic counts, and then adjust it from there. If we're finding out that local residents are being precluded from using the park, these guys are not going to keep taking those phone calls, they are going to make adjustments, and that was the idea. It's a management call, it's something that's adjustable over time, but the community just felt the park just needed a break; it is just way too overrun, it's been way too overrun for way too long, and everybody just...

Mr. Helder: I don't disagree with you, but it sounds like it's de facto become a Federal Park.

Ms. Griffin: Is there anybody from the public that wants to speak at all?

Okay.

Deputy Director Kaaina Hull: If I could...

Ms. Griffin: Yes, Kaaina.

Mr. Hull: Was there somebody that wanted to speak? Sorry.

Ms. Griffin: No.

Mr. Hull: If I could interject here, too. Kimi folks have had a bit of a yeoman's effort. I actually attended a few of the meetings in the beginning, and they are extremely contentious meetings that they've held out in Hā'ena. Essentially, the big issue was moving the visitors away from the rockfall because they didn't want to have to, essentially, strip away that rock area.

I think this Commission is focusing on what is one (1) of the primary issues of the park and that's access, which is not going to fall on deaf ears because that's the big controversy right now going on with them. And that's where they will be focusing on for the next several years as they push through the EIS and they actually push through the permit process. What I would urge this Commission to realize is that don't let that issue, necessarily, be your sole focus in the sense that there is some cultural practitioner access issues, as Commissioner Helder is getting into, but there may be other historical issues at hand that will get lost if you solely focus on this big controversial side, be it the recognition of the Caretaker's site or the restoration of that cottage in particular or the historical district that's in that vicinity. You may want to take this time to address these historical issues because it's not only the purview of this Commission, that's really where a lot of the authority and a lot of the potential changes or where the State, through this EIS process, will be really listening to what needs to be said about the historical, be it cultural practitioner, be it structures, be it archaeological sites. If this Commission misses that opportunity because it's going to focus on the real controversial issue, which is going to get a lot of focus and that will probably be the bulk of the focus that they have to handle with, but don't let the other historical elements fall by the wayside in exchange for that. So I kind of urge this Commission to kind of focus on some of those other issues that might not be as controversial or sexy as access, but it really deserves as much weight, if not more sometimes.

Ms. Griffin: Thank you. And I do have a question. In the maps in your presentation, you showed the elevated boardwalk over the lo'i and I know that some of those walls have been carbon dated to 1,000 years. I was wondering if the Hui Maka'aina o Makana agrees with that route.

Ms. Yuen: That was actually recommended by them.

Ms. Griffin: Okay.

Ms. Yuen: So, and Alan you should jump in, where we've located it, Alan right, there's actually no stone walls.

Mr. Carpenter: Right.

Ms. Yuen: It's earth berm.

Mr. Carpenter: There are earth berms in between, probably what are older stone walls, and these are later additions that subdivided the lo'i. We thought about it, specifically in a way to impact as little as possible and from an Archaeologist standpoint, which is my background, we have plenty of places if we need to do more research, but we did a full inventory survey of this prior and actually our dates were actually 700 years old for this particular site, with a later phase about 300 years ago. But we did consider banking that research potential, or whatever, as well for the future,

and this is a route that was as close to the rockfall zone as we could get and still be safe. The boardwalk breaks the continuity of that system a little bit, so you want to have it as close to the highway or as close to the edge of the lo'i system as you possibly could so that you have an unbroken system from there all the way to the ocean. It was definitely considered.

The secondary thing, of course, is that we hear that people aren't learning or appreciating enough about things, other than the beach and the trail, and this is an opportunity to send people to let them really appreciate it from above without standing in it and impacting it, and give them interpretive stories along the way, safely. It enriches the experience for everybody.

Ms. Schneider: Were you going to rebuild the Allerton Cottage?

Mr. Carpenter: The Allerton Cottage is still in fair condition.

Ms. Schneider: No, the one that burnt down.

Mr. Carpenter: We have no intent to rebuild the Allerton House, the main house, no. The potential is there for perhaps a staging area, maybe even a roof pavilion, or something like that that can be associated with prep for hula practitioners as they head to the actual traditional site. But no, we are not going to try to replicate the old house.

Ms. Yuen: I think part of the discussion we had, and we on purpose kind of left very little recommended for that area because we feel the hula community should really be the ones to say what happens in that space, so that's why we just kind of designated the area as a hula complex. In initial discussions with Kumu Hula Kehaulani Kekua, she actually thought well, you know, maybe it's not too bad to have it as an open staging area, or whatever it is, for them. I think those ideas will come up later and what they want to actually do in that space, but that's why that area we don't really have too much recommended. It's for a future planning phase that should involve the hula community.

Ms. Griffin: I was impressed with the plan. I know it was a result of a lot of hard work and a lot of years and some fault starts. One of the things that I, and we got this document of 1,018 pages fairly recently, it's been less than 24 hours, so while I've seen parts of it, I haven't seen the whole thing, but the idea of having a cultural advisory committee sounds really good. But you know and I know that places like the 1977 Līhu'e Development Plan recommended a community advisory committee, and I was wondering with our kahu relationship with Kaneiōlōuma and the other private-public partnerships that are starting, is that the way you see it? Or are you recommending to reserve a certain amount of funds to have that happen? How is the Master Plan going to assist making the advisory committees actually happen?

Ms. Yuen: If you want to read another voluminous document, the Master Plan report itself is attached as a CD because it was just way too much paper to print, but in the appendix of that, the advisory committee probably vetted every possible thing on this, so there was a whole meeting set aside even to discuss that and what that would be like. NTBG has a similar committee, so they kind of framed out some existing rules that would be on it, how often they would meet, and that

kind of thing, so that was attached as an appendix as kind of a groundwork for State Parks to look at and use possibly in doing this. I think the great thing about this project and our current advisory committee is that there is still a lot of energy. Like they want to see this through and they were the ones that said hey, what about a broader community advisory group, so I mean the fact that they would still want to keep on it, and the concept there was that they just meet maybe once a year with State Parks to see where they're at, implementation. If there's any kind of projects to come to, I mean State Parks, this is a wonderful resource for State Parks to have, too, because now they have a body that they can vet things off before they have to go in front of the larger public, so I think both ways I mean, it's in State Parks interest to keep that going. I don't think this community will let them not have one, so this is a pretty vocal, active community group. I think State Parks will be hearing from them whether they like it or not, honestly.

Mr. Carpenter: We like it actually.

Ms. Yuen: Yeah, no I think it's been great, the relationship. And even over the, it's been 7 years, I've seen it change and evolve, and I think it's a good thing, so hopefully it can continue.

Ms. Griffin: As to the houses and even the orientation center and all, we would expect as a body, the Historic Preservation Review Commission, to be involved as you all look to rehabilitate those.

Any other questions?

Mr. Long: Yes, I have a question.

Ms. Griffin: Yes.

Mr. Long: Is the area mauka of the old highway then off limits to the public; the caves?

Ms. Yuen: That's a good question.

Mr. Carpenter: Well most of the area mauka of the highway is cliff, but there are the two (2) caves; one (1) immediately adjacent to the road and one (1) with a walkway, old asphalt roadway, up to it. There's a third site, there's a rock shelter, and then there is Lohi'au's house site right at the end. They aren't going to be developed to attract people, and of course this plays very heavily into the fact that they are all within the rockfall zone. So traffic will be diverted away from the caves, and in fact what was originally envisioned as the pedestrian pathway was the highway corridor. That all got changed due to the rockfall assessment, and the desire by the community, and us, to not deface makana, the cliff. So everything got pushed into a safety zone. There will be viewing opportunities of the cave, presumably from the same pathway, the elevated pathway. Whether we will allow people at their own risk and with adequate warning to go and approach the caves, I mean I think, personally, it's kind of an eye sore right now with the number of signs and warning signs we have, probably. I think we don't physically have the ability to keep people out, but they will not be invited there or it won't be developed.

Ms. Yuen: The primary reason for that is that according to the rockwall engineers, those are actual the most hazardous areas because of the shear face of it. If a rock fell off of it, it would fall on you. It's not going to bounce, it's not going to go anywhere else; it is going straight down where people would be. So that is what we were wrestling with.

Mr. Long: Has anyone ever been hurt by a falling rock?

Ms. Yuen: There's been stories. I mean, even a member of our advisory committee had said there was one (1) instance when they have gone out, drove the length of Kē'ē. In that short time that they turned around to come back, there was maybe a 7 or 8 foot boulder that had fallen on the highway. And this was many years ago, but it's happened not in too distant history. Even when we heard the initial findings from the rockwall engineers, they had identified, was it four (4)? That you guys actually ended up removing that could have imminently fallen within that time, so State parks went ahead and dealt with those rocks that were about to fall down. It's not something that State Parks wants to just kind of say, well you know, people still want to go there; it's a huge liability for them.

Mr. Long: It has to find balance.

Ms. Yuen: That's exactly it.

Mr. Long: From protecting the public and...

Ms. Yuen: If nobody sued State Parks, right, if nobody sued State Parks, took everything under their own, or followed the signs, or whatever, but anyway...

Mr. Carpenter: It's a liability issue, but nobody wants anybody to get hurt or killed either, right, so.

Mr. Long: It would be nice if, in your plan, those cultural areas, the caves, you know, some people like to go to, and particularly the one up above local people like to go to, not encourage, but maybe at your own risk. I'd like that.

Ms. Yuen: Yes, exactly. And I think...

Mr. Carpenter: It would have to be.

Ms. Yuen: Yes, it would have to be. And the other way we could address those key sites that we know people still want to go to, maybe it becomes a guided tour, maybe something that's a little more controlled where it's not just a free for all, but people are informed of the risks and you do this knowingly. But those things kind of need to fall into place now that State Parks knows the potential hazards that are there.

Ms. Griffin: Anne.

Ms. Schneider: How does this impact the road that's on the register?

Ms. Yuen: So actually, the impact is going to be less because you won't have so many people or cars on it.

Ms. Schneider: Right, but will you change anything about the road?

Ms. Yuen: No. No. If anything, what had come up was if there was a potential way to make that surface more pervious, meaning water can actually filter through it a little bit better, that was kind of discussed, but there was some debate about actually changing the paving material and whether that would jeopardize its integrity. So that kind of discussion, I think, was on the table for now because I don't think it would maintain the integrity that got it on the register, but otherwise there's nothing else.

Ms. Griffin: Okay.

Mr. Long: You know, if lot coverage is an issue, there are new materials out for paving that are semi-permeable; just in the last few years.

Ms. Yuen: That's definitely what we're proposing; even for the pathways. Of course the boardwalk would have an open structure, I would think, so that wouldn't be an issue, but you know, even the pathways around the parking lot, all of that is discussed as having permeable material.

Mr. Long: Is the boardwalk ADA?

Ms. Yuen: It would be. It would be recommended to be ADA.

Mr. Long: How wide?

Ms. Yuen: We've estimated between 8 and 10 feet. It depends whether State Parks is going to allow bikes or not on it. I think if we're going to do bikes, then 10 feet would likely be the minimum width. But we also don't want to impact the lo'i either so it's that delicate balance of something that's too intrusive to the lo'i versus appropriate access, but yes, at the minimum it's ADA accessible.

Ms. Griffin: Commissioners, we have some choices here. We can accept as presented, we can make comments today, or we can take the documentation back, study it more, and there's time for us to make comments at our September meeting. So what is your pleasure?

Ms. Schneider: I think it would be better if we all had a chance to read the document before we make any comments. Has everybody had a chance to read it? (Laughter in background)

Ms. Griffin: And the 137 page CIA, Cultural Impact Assessment.

That will put some pressure on our Staff to be able to take comments at our September 3<sup>rd</sup> meeting and get it to the Master Plan folks by the 8<sup>th</sup> before the comments close.

Mr. Hull: Kimi, the comments period closes September 8<sup>th</sup>?

Ms. Yuen: Yes.

Mr. Hull: Well, that depends because I know we talked with the Chair earlier about possible change because of staffing for the September meeting. In order for the comments to go to OEQC for the comment process from this body, it has to be acted upon by this body; it has to be officially voted upon by this body.

Ms. Griffin: So if there's other important business, perhaps we can have two (2) meetings next month.

Mr. Hull: Yeah, it's just that the meeting will have to be held prior to September 8<sup>th</sup>, right?

Mr. Helder left the meeting at 4:27 p.m.

Ms. Griffin: Right, that would be what's on the agenda now; as the 3<sup>rd</sup>.

Mr. Hull: Oh, I see where you're going Pat.

Ms. Schneider: We have a meeting scheduled for the 3<sup>rd</sup>.

Mr. Hull: That's correct, yes.

Ms. Schneider: So would you have time if we?

Mr. Hull: I think what would be, probably, best in order to facilitate somewhat of an efficient meeting, would be if Commissioners had particular comments that they wanted to float during the Commission hearing that you forward it to Staff and we can craft it in a manner that would be most appropriate for a motion and discussion.

Ms. Griffin: That's an excellent suggestion. Thank you.

Is everyone willing to do that? Take a stronger look at, or a longer look I guess, at this document. Come back next month, and in the meantime, before the one (1) week sunshine rule, get comments to Staff, so that the discussion at the September 3<sup>rd</sup> meeting can be directed and easier to translate into a memorandum.

Mr. Hull: You can email those directly to me. If we have any questions or discussion the comments that are emailed, then I can discuss with you how exactly you want that. And just to be clear, as I watch Jodi possibly hesitate, as long as the comments aren't shared with other Commission members, right? (Laughter in background)

Ms. Schneider: Just with you.

Mr. Hull: Just directly with Staff to help with the crafting.

Ms. Griffin: Of course. We wouldn't dream of doing anything.

May I have a motion to defer?

Ms. Schneider: I make a motion that we defer all comments until the next meeting on September 3<sup>rd</sup>.

Mr. Helder returned to the meeting at 4:29 p.m.

Ms. Griffin: Is there a second?

With no second, the motion dies. So may I have another motion on how to respond to the Hā'ena State Master Plan?

Ms. Higuchi-Sayegusa: Did you folks have any comments now? There are a couple of options here; you can defer it to the next meeting, make comments at that point, make comments today, receive it at this point.

Ms. Schneider: I think it was such a long document that it was too much to absorb in a couple of hours to make comments.

Ms. Griffin: This body is charged with the responsibility to protect, preserve, and maintain the historic resources of the County. It is incumbent on us to respond to documents of this level of importance, so I'd like to get some comment or the deferral to next month.

Yes, Stephen.

Mr. Long: I'd like to make a motion that we defer our comments on this plan until our next meeting, but in preparation for the next meeting that all of our comments, after we have read the text, be forwarded to Myles or Kaaina before the meeting, so they are concise and to the point.

Ms. Schneider: I second the motion.

Ms. Griffin: It's been moved and seconded that we defer any official comments until our September 3<sup>rd</sup> meeting, and that the comments that each of us individually have about the plan, having reviewed it more thoroughly, be forwarded...what's the Friday before September 3<sup>rd</sup>?

Mr. Hull: August 28<sup>th</sup>.

Ms. Griffin: Before August 28<sup>th</sup>, so that there will be the opportunity to have a concise report that the Commission then can respond to.

Any discussion? (None) All in favor? (6 ayes) Opposed?

Ms. Santos: Me.

Ms. Griffin: So it's six (6) in favor, one (1) opposed. Motion carries 6:1. Thank you so much. We appreciate the time that you've spent with us today.

Ms. Yuen: Thank you for having us.

Mr. Carpenter: Thank you.

Ms. Higuchi-Sayegusa left the meeting at 4:33 p.m.

Deputy County Attorney Andrea Suzuki entered the meeting at 4:33 p.m.

**Re: Letter (7/27/15) from Donald L. Smith, P.E., Acting District Engineer, State of Hawai'i, Department of Transportation, Highways Division requesting to discuss the bridges that are currently planned for rehabilitation or replacement.**

Ms. Griffin: So Item D.3., under New Business, is the letter from Donald L. Smith, P.E., Acting District Engineer from the Department of Transportation to discuss the bridges that are currently planned for rehabilitation or replacement.

Mr. Smith, it's always a pleasure.

Donald Smith: Hello. Donald Smith, Hawai'i Department of Transportation, Kaua'i District.

Ms. Griffin: We got your letter, so let us know what you're thinking. It looks like today you're going to talk about Kapaia.

Mr. Smith: Actually, at the last meeting for Ōma'o Bridge Park Project, the Commission requested that the Hawai'i Department of Transportation produce a list of bridges that we might or would be working on in the future. So I would like to address that.

Ms. Griffin: Okay.

Mr. Smith: I did bring...did everybody get the handout? If you look at the handout, the bridges that are highlighted are bridges that we are currently working on either a design contract or working on a design for. There are two (2) lists; one (1) list is the functionally obsolete State bridges list. Functionally obsolete is, essentially, means that when it was designed, it will no longer meet the purposes of the current roadway system; whether it be for types of vehicles or size of vehicles, weights of vehicles that type of thing. Then the structurally deficient list, which is the smaller list, is actually a list that's generated from our Federally Mandated Bridge Inspection Program. Once a bridge receives a rating of a certain number, it becomes or is on the structurally deficient list, I will say this carefully because it doesn't necessarily mean it's going to fall down, but it does mean that it needs attention. It helps us to generate a list of what to work on next, so you can see on that

# Hā'ena State Park Master Plan Draft Environmental Impact Statement (EIS)

---

COMMUNITY MEETING | August 19, 2015

## Tonight's Meeting

- Present an overview of the draft master plan and key management recommendations.
- Share public feedback received to-date.
- Collect additional comments for the Draft EIS.
- Share important dates and contact information for the Draft EIS.
- This is *NOT* a meeting on the Hā'ena Community-Based Subsistence Fishery Area Rules.

# Project Overview

## Hā'ena State Park- Existing Site

## Hā'ena State Park

- 65.7 Acres
  - Majority of the Park is State land.
  - County owns 0.68 acres, which contains Ka Ulu A Paoa Heiau and Ke Ahu A Laka.
- State used Federal Land and Water Conservation Funds to acquire the land in 1977.
- There is no adopted master plan or accepted EIS for the Park. State Parks needs them to make capital improvements at the Park.

## Hā'ena State Park

- Significant Sites:
  - Storied Kē'ē known for the Pele, Lohiau, and Hi'iaka legend
  - Ka Ulu A Paoa Heiau and Ke Ahu A Laka
  - Lohi'au's house platform
  - Lo'i and 'auwai complex
  - Wai a Kanaloa and Waikapala'e (wet caves)
  - Kē'ē Beach and Lagoon
  - Na Pali o Makana
  - Trailhead to Kalalau Trail and Nāpali Coast State Wilderness Park
- Registered Historic Places:
  - Hā'ena Archaeological Complex (State & National, 1984)
  - Nāpali Coast Archaeological District (State & National, 1984)
  - Kaua'i Belt Road (National, 2004)

## Hā'ena State Park – Issues

- Extreme increase in visitors
    - Visitor counts in August 1993: 350 per day
    - By 1997: 1,700 per day
    - Today: over 2,000 per day
  - Rockfall Hazard
    - Recent study found areas along the highway are within a potentially high hazard rockfall zone
- Need to protect the natural, cultural, and historic resources at the park while balancing recreational use and public safety.

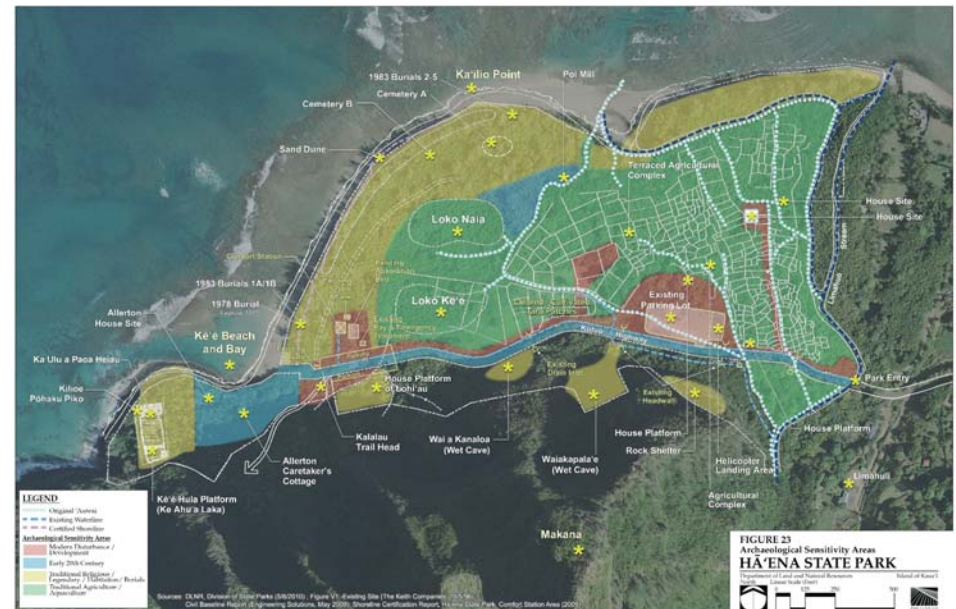

## Master Plan Advisory Committee (MPAC)

|                                                                 |                                                                                 |

## Hā'ena State Park – Goals and Vision

- Recognize that the entire park is culturally significant.
- Restore Hā'ena State Park as a living place—cleanse, restore and revive cultural practices again.
- Involve the original families and reconnect the local community to the place.
- Uphold State Park's responsibility for the public's safety, access, and welfare.
- Balance the provision of recreational opportunities with the preservation of the significant natural and cultural resources.

## Hā'ena State Park- Archeological Sensitivity Areas

## Hā'ena State Park-Draft Master Plan

## Features of the Draft Master Plan:

- New Welcome Pavilion/Education and Cultural Center
- Interpretive Path with boardwalk access to Kē'ē, makai of the highway and outside of potential rockfall hazard
- Caretaker's Cottage and Baseyards
- Hula Complex
- Cultural Gathering Place
- Restoration of the Dune Complex, Agricultural Complex, loko, and varied historic, cultural, and natural resources throughout the park.

- New Welcome Pavilion/Education and Cultural Center
- Interpretive Path with boardwalk access to Kē'ē, makai of the highway and outside of potential rockfall hazard
- Caretaker's Cottage and Baseyards
- Hula Complex
- Cultural Gathering Place
- Restoration of the Dune Complex, Agricultural Complex, loko, and varied historic, cultural, and natural resources throughout the park.

## Features of the Draft Master Plan:

- Transportation/Park Access:
  - Highway closed to through traffic
  - Small special access only parking lot at Kē'ē for cultural practitioners, lawai'a, hunters, and ADA access at Kē'ē
  - Shuttle Alternatives
  - Pedestrian/Bicycle Access
  - MPAC preferred scenario: remote park entry and parking in Princeville, with a shuttle to the park
- Main Parking Lot:
  - Onsite visitor parking lot that can be sized appropriately with permeable surface

## Features of the Draft Master Plan:

- Green Design and Green Infrastructure:
  - Energy efficient design
  - Integrated water/wastewater/drainage plan
    - Rainwater catchment
    - Treatment of wastewater and reuse where appropriate
    - Restore 'auwai wherever possible and the natural drainage flows
    - Landscaped bioswales and raingardens
  - Renewable energy
  - Permeable surfaces

## Hā'ena State Park- Near-Term Plan

FIGURE 28  
Near-Term Plan for the Entry Complex  
HĀ'ENA STATE PARK  
Conservation of Land and Natural Resources  
Based on Known

Disclaimer: This graphic has been prepared for general planning purposes only and should not be used for boundary interpretations or other spatial analysis.

## Key Management Recommendations:

- Create a Cultural Advisory Group and a broader Community Advisory Group.
- Set an initial daily visitor limit at 900 visitors per day.
  - Includes park visitors and day hikers.
  - Does not include cultural practitioners, hikers and hunters with valid permits, volunteers and special hālau or lo'i workgroups, school/educational groups, lawai'a, cemetery caretakers.
  - Will be adjusted over time depending on the impacts.
- Require visitor orientation prior to park entry.
- Require staff and volunteer education.

## Comments Received To-Date:

- Concern over 900-person daily visitor limit
  - How will it be enforced?
  - Can you limit non-residents but allow residents access?
  - Can it be changed over time?
- Concern over the boardwalk
- Concern over putting “buildings” within the park
- Concern about parking within the park
  - Too little, too much
  - Don’t pave over the park
- Can we get the visitor industry to help since they caused the problem?
  - Example: Hotels shuttle their guests to the park, such as the Hanalei Colony

## *Kuleana...*

- *Defined as both a “right” and “responsibility”*
- One idea is to join a volunteer group who helps take care of the park.
  - Then you will not be subject to the daily visitor limits, and
  - You can help mālama the park!

# Environmental Impact Statement (EIS)

## Process      Key Dates

### Why is the Draft EIS so long?

- An EIS has been prepared rather than a less extensive EA due to the many triggers that require environmental review for this project:
  - Use of State lands or funds
  - Use of County lands
  - Use within a shoreline area
  - Use within a Historic site as designated on the Hawai'i and National Registers of Historic Places
  - Land uses within the Conservation District
  - Modification of existing helicopter facility within the State that may affect lands within a Conservation District, shoreline area, and registered historic site

## Draft EIS Organization

- Project Overview
- Section 1.0: Draft EIS Summary
- Section 2.0: Project Description
- Section 3.0: Description and Assessment of the Natural Environment
- Section 4.0: Description and Assessment of the Human Environment
- Section 5.0: Conformance with Federal, State, and County Regulations
- Section 6.0: Alternatives
- Section 7.0: Contextual Issues
- Section 8.0: Consultation
- Section 9.0: List of Preparers
- Section 10.0: References
- Section 11.0: Pre-Consultation Comments and Responses
- Section 12.0: EISPN Comments and Responses

## Technical Studies (Appendices)

- Rockfall Hazard Assessment
- Biological Survey
- Marine Natural Resources and Recreation Assessment
- Cultural Impact Assessment
- Traffic Impact Assessment Report
- Civil Engineering Baseline Report
- Wastewater Preliminary Engineering Report

## Anticipated Permits Required for Implementation

- An EIS is not a permit – after the EIS separate actions will be required, as noted below:
  - Final Master Plan Approval by the BLNR
  - Compliance with Chapter 6E, HRS (Historic Preservation)
  - SMA Permit
  - Shoreline Setback Determination
  - Wetland Delineation Study and Determination
  - National Pollution Discharge Elimination System (NPDES) Permit
  - Development permits for specific uses, and
  - Depending on the instream activities pursued, Stream Channel Alteration Permit; Stream Diversion Works; and/or Petition to Amend Instream Flow Standard

## EIS Process

## Draft EIS Distribution:

- Federal Agencies (12)
- State Agencies (31)
- County Agencies (10)
- Elected Officials (13)
- Community Groups & Individuals (33)
- Hard copy available at Princeville Library
- Digital copies at Līhu'e Regional Library and Kaua'i CC Library
- Download from OEQC Website:  
[http://oeqc.doh.hawaii.gov/Shared%20Documents/EA\\_and\\_EIS\\_Online\\_Library/Kauai/2010s/2015-07-23-KA-5B-DEIS-Haena-State-Park\\_Master-Plan.pdf](http://oeqc.doh.hawaii.gov/Shared%20Documents/EA_and_EIS_Online_Library/Kauai/2010s/2015-07-23-KA-5B-DEIS-Haena-State-Park_Master-Plan.pdf)

## Mahalo Nui Loa!

**Break Out Groups**

**MAHALO**

The map shows the Kalamazoo River watershed, with the river flowing from the north towards the south. Key locations labeled include Kalamazoo, Holland, Spring Lake, and Holland. The map also shows the Kalamazoo River, Kalamazoo Lake, and Kalamazoo Bay. A legend in the bottom left corner identifies symbols for the river, lakes, and towns. A scale bar in the bottom right corner indicates distances in miles. The map is titled 'Kalamazoo River Watershed' and is part of a larger project titled 'Kalamazoo River Watershed'.

[illegible]

## July 2016

1. The education center and caretaker's cottage have been deleted. A smaller welcome hale is all that will be located at the entrance and is envisioned as a thatched open traditional Hawaiian hale.
2. New restrooms for men and women (located to the right of the welcome hale, but separate).
3. The interpretive path is now a pedestrian-only path and its alignment is shifted mauka near Kēle to better direct people towards the beach areas overseen by the lifeguards. The loop path through the lō'i back to the entrance has also been deleted.
4. The main parking area is separated into a fee-paying lot and a non-fee paying lot that can be adjusted in size as needed.

- Entry turnaround with shuttle stop
- Formalized parking lot with kiosk
- Welcome hale
- Pedestrian path
- Parking area bathrooms
- Cultural gathering area with hālau wa'a and traditional hale

For more information, please check the Hawai'i State Parks website:  
<http://dlnr.hawaii.gov/dsp/>

**Summary of Community Advisory Committee's Draft of  
Proposed Revisions to Hā'ena State Park (HSP) Master Plan  
July 2016**

**Access Summary**

1. HSP will establish **Controlled Access Hours** (CAH) as a way to manage overuse of the park by the public and to help restore a balance to this culturally significant area.
2. **Controlled Access Hours** (CAH) are proposed to be 7:30 am - 5:30 pm, but are subject to change if park use before 7:30 am or after 5:30 pm is excessive.
3. HSP will be adaptively managed by the community and the Division of State Parks to achieve the goal of reducing use to approximately **900 persons per day during CAH**. This will be averaged over a month so adjustments can be made for park closure days and is therefore a "soft" limit.
4. DLNR rules allow state parks to manage impacts by establishing two types of park users. These are: 1) Fee-Paying Park Users (FPPU) and 2) Fee-Exempt Park Users (FEPU). All residents of Hawaii qualify to be Fee-Exempt Park Users.
5. Entry fees are established by Hawai'i Administrative Rules (HAR) 13-146-6 at the rate of \$5/car or \$1/person. HAR 13-146-6 also states that Hawaii residents are exempt from paying park entry fees if they can show a valid Hawai'i ID. Other categories of FEPU may be established such as registered volunteers.
6. Access to HSP will be limited to a single entry point, at Kūhiō Highway near the present parking lot/helipad site. This single entry point will be used to control access during CAH.
7. Vehicles will be allowed into one of two designated parking areas – one for Fee-Paying Park Users (FPPU) and one for Fee-Exempt Park Users (FEPU).
8. Outside of CAH: anyone may enter the park, by vehicle, on foot, or by bicycle; but they must leave the park before the start of CAH unless they meet the requirements for park access during CAH. (See two items immediately below.)
9. During CAH: FPPU (non-residents) will be allowed to enter the Park only if they possess a pre-paid entry receipt. This applies to all FPPU, regardless of whether they arrive by car, by shuttle, by bicycle, or on foot.
10. During CAH: adaptive management of the size of the FEPU parking area and adaptive management of the number of park entry slots held back for daily use will be used to meet the typical access needs of FEPUs, enabling them to enter the park by car (using the FEPU parking area), by shuttle, by bicycle or on foot.
11. Native Hawaiian cultural practitioners visiting the park to undertake their traditional and customary cultural practices will be exempt from park visitor limits.

**Parking Summary**

1. The approximately 100 space parking area shown in the Master Plan will be adaptively managed to accommodate both FPPUs and FEPUs.

2. The area shown in the Master Plan as a "Staging Area" (just north of the primary parking area) can be used for volunteer and cultural groups that access the park via a special use permit.
3. A small, approximately 15 stall parking area near the existing restroom at the end of the road will be strictly managed only for handicapped park visitors and for cultural practitioners who have an authentic need to use that parking area.
4. Overnight campers at NPCSWP will not be allowed to use the parking areas. (This will also be a specific condition of their NPCSWP camping permits.)
5. Unauthorized parking anywhere in the park will be subject to tow-away. It is intended that parking restrictions and tow-away zones will be strictly enforced.
6. State Parks and the CAC will advocate for DOT to establish tow-away zones between Limahuli Stream and the eastern boundary of Hā'ena ahupua'a (close to the Hā'ena Place cul de sac). We propose that parking will be allowed only for residents who obtain residential parking stickers for their vehicles.
7. The HSP CAC will work with the HI DOT and the County to implement and enforce this plan so that parking along Kūhiō Highway does not negatively impact the larger community.

---

**Shuttle Transportation Summary**

1. The HSP CAC is working with county, federal and state agencies to promote the creation of a north shore shuttle system that will enable HSP and NPCSWP visitors to park in Princeville and/or other locations and take shuttle buses to and from HSP. The shuttle bus would be capable of accommodating day-use gear by Kē'ē Beach users and camping gear by NPCSWP overnight campers.
2. Until such a shuttle exists, the HSP fee-based parking area will be managed to maximize the capability of the parking area to accommodate park visitors and minimize traffic impacts.

---

**Facilities Summary**

1. For safety reasons (rockfall hazard), the existing road (Route 560) will be closed from the park entry point (near the present parking lot/helipad site) to the parking area at Kē'ē, and replaced with an ADA-compliant pedestrian path, makai of the projected rockfall zone.
2. Limited use of the existing road will be allowed for authorized personnel (staff, lifeguards, and emergency vehicles) and qualified park visitors (ADA access, cultural practitioners who require access to Kē'ē, authorized retrievals of distressed kayakers, etc.).
3. The existing visitor parking area at Kē'ē will be closed. Visitor parking will take place at the ~100 space parking area near the park entry point. A small, ~15 space parking area will remain near Kē'ē for use for ADA access and cultural practitioners with special needs.
4. The park entry area will include a turnaround, shuttle bus stop, small 20'x30' welcome pavilion/hale (much smaller than that proposed in the Draft EIS/Master Plan) and comfort stations.

## Appendix B

# Rockfall Hazard Assessment Haena State Park Kauai, Hawaii

Prepared for

State of Hawaii  
Department of Land and Natural Resources  
Division of State Parks  
1151 Punchbowl Street, Room 310  
Honolulu, Hawaii 96813

Prepared by

AECOM  
1001 Bishop Street, Suite 1600  
Honolulu, Hawaii 96813

June 2013

## OVERVIEW

---

AECOM Technical Services, Inc. (AECOM) has prepared this rockfall assessment for the State property within Haena State Park along the mauka side of Kuhio Highway in accordance with Federal Highway Administration (FHWA) publications and construction industry standards. The purpose of the assessment is to evaluate rockfall potentials and hazards and to recommend rockfall mitigation methods best suited for this site. It is AECOM's opinion that it is impossible to speculate with great certainty as to when any of the rockfall areas referenced in this report could result in an actual rockfall event; however, it is possible to identify the areas that show a potential for rockfall hazard.

This rockfall study was performed in two consecutive phases: a) geological survey of the site and rockfall hazard identification, and b) engineering planning study of the rockfall condition and development of preliminary rockfall protection design alternatives and cost estimates. During the geological survey phase, areas with potential for rockfall or landslide were identified and sitespecific descriptions were obtained. The geological conditions of the site and the key rockfall features are presented in a report format including color photographs. The engineering planning phase identifies engineering solutions in terms of alternative designs for reducing potentials of rockfall hazards. A preliminary construction cost estimate is provided for each alternative design. All work is based on the research data and the recommended procedures by FHWA, United States Department of Transportation, and the engineering and construction standards accepted by the industry.

Many rockfall features and many recent rockfall activities were found during field investigation. Some of the recent rockfalls occurred right next to and ended on the Kuhio Highway close to the Wet Cave (Wai a Kanaloa). The area around the Wet Cave (Wai a Kanaloa) is the most hazardous rockfall area because: 1) many rockfall features exist there; 2) very high probability for rockfalls to reach the roadway or Wet Cave (Wai a Kanaloa); and 3) almost constant presence of visitors in this area. The Wet Cave (Wai a Kanaloa) area is rated rockfall hazard Class A entailing a high hazard rating. Rockfalls are less likely to reach the roadway or beach at other places.

The annual probability of loss of life from rockfall along Kuhio Highway and the beach within Haena Park is estimated at  $6.4 \times 10^{-4}$ , higher than the recommended tolerable level of  $10^{-5}$  for general public. Therefore rockfall mitigation is recommended for Haena Park to reduce rockfall risk to park users.

The recommended permanent engineering mitigation design alternative for Haena Park is a combination of rockfall impact fence and anchored wire mesh system due to its effectiveness, and least disturbance to environment, with a cost of 9.8 million dollars and a construction period of eight months.

For temporary rockfall mitigation design, scaling is recommended due to its ease of construction, least disturbance to environment, and cost-effectiveness in rockfall hazard reduction, with a cost of \$750,000 and a construction period of four months to scale the high hazard area around the two Wet Caves and all the identified boulder sites in this report. An additional 1.5 million dollars and a construction period of six months are needed to scale other areas. Only rocks that are likely to reach the roadway or other protected structures need to be scaled.

However, it has been noted that the North Shore and Haena communities would not support any disturbance and potential devastation to the sacred mountains at Haena caused by rockfall mitigation and construction. Consequently, there are two other plans at work addressing the long term and short term concerns. The long term plan is to divert the public traffic away from the high rockfall zones. This would be accomplished by closing the highway to both vehicular and on-foot public travelers while redirecting them through walkways that are built in the safe rockfall zones. This is part of a master planning process that the State is currently working on with the public. For the short term mitigation solution and in the interim, AECOM has proposed demolition and stabilization of some of the larger rocks (a total of 4 to 6 rocks) along the base of the mountain near the areas of the Wet caves. This work will be implemented using basic tools such as rock scaling bars and

airbags. Once these rocks are dislodged, they would be brought to rest in a stable location along the foothills. All dislodged rocks are planned to be left at the site. The cost of this effort has been estimated at about \$400,000 and a construction period of about three weeks.

## Section 1.0

## Introduction

## 1.0 INTRODUCTION

Faced with potential for rockfalls on the mauka side of Kuhio Highway at Haena State Park, the Department of Land and Natural Resources, State of Hawaii, tasked AECOM Technical Services, Inc. (AECOM) to perform a study of the present rockfall condition for the site (Figure 1-1). AECOM geotechnical engineers and geologists performed the field investigation using visual means and methods. Rockfall locations identified in this report are based on coordinates shown on a hand-held global positioning system (GPS) unit with +/- 30 ft accuracy under normal condition. These identified sites are representative samples of potentially hazardous rocks. Similar types of rocks may exist along the project site which were not identified and documented in this report. Topographic surveying and sub-surface investigation were not a part of the scope of this study. The specific conditions described in this report pertain to those present at the time of field investigation.

### 1.1 SCOPE OF SERVICES

The scope of services included the following tasks: (1) conduct field reconnaissance; (2) assess and delineate the falling rock hazards; (3) identify and articulate options to mitigate the potential hazard; (4) identify and articulate the risks associated with each option; (5) identify products required for each option; (6) identify locations (in Hawaii if applicable) where the options have been implemented; (7) provide budgetary cost estimates for work required under each option; and (8) identify experienced contractors qualified to perform the work.

### 1.2 IMPLEMENTATION PLAN

The project was implemented in two phases, as follows:

#### 1. Geological survey of the site and rockfall hazard identification:

AECOM performed a visual assessment of the geological formation and rock outcroppings along accessible areas of the mountain slope.

A geological report was prepared to identify the key features of the site geology and to locate rock outcroppings including GPS readings and color photography. The study methodology is based on applying suitable methods recognized by the Federal Highway Administration (FHWA), United States Department of Transportation (USDOT), and the prevailing construction standards used in the industry.

#### 2. Engineering planning study of the rockfall condition and development of preliminary rockfall protection design and cost estimates:

The AECOM team performed an engineering study for identifying alternative mitigation procedures which ultimately led to prescribing of a recommended methodology based on accepted engineering practice and sound economics to reduce rockfall hazards.

A budgetary cost estimate was provided for each design option.

Figure 1-1: Site plan of Haena State Park rockfall assessment project.

## Section 2.0

# Geological Survey of the Site and Rockfall Hazard Identification

## 2.0 GEOLOGICAL SURVEY OF THE SITE AND ROCKFALL HAZARD IDENTIFICATION

### 2.1 ROCK FORMATIONS—FOUNDATION OF ROCKFALL

Knowing local geology knowledge is essential to understanding the potential hazards of rockfall events and the associated mitigation methods.

The island of Kauai consists of a single shield volcano, which is deeply eroded and partly veneered with much later volcanics. The rock formation exposed at Haena State Park belongs to the Napali Formation (or Napali Member), the oldest exposed shield volcano formation above ocean water (Stearns 1985; MacDonald et al. 1983). Talus, formed by fallen rocks piled against the high cliffs, is another major rock formation exposed at the project site.

The Napali Formation consists of mainly basaltic lava flows with two morphology types: 'a'a and pahoehoe. 'A'a flows are formed by dense (low volatile content) and viscous lava. As the viscous lava flows, it constantly shears apart its top crust formed by cooling to produce the top rough and jagged clinkers. At the front of a'a flows, the top clinkers—carried along by the flowing lava like on a conveyor belt—tumble down and are buried by the advancing lava over them, forming the bottom clinkers. A typical 'a'a flow unit, therefore, consists of three layers: the top and bottom clinker layers and the middle interior. Vesicles in the middle interior are commonly stretched or of irregular shapes. Due to differential erosions—the fast erosion of the weak, very vesicular, and poorly cemented clinkers and the slow erosion of the dense interior, a'a interiors are of ten overhang and prone to rockfall.

Pahoehoe flows are formed by fluidal lava (low viscosity) with high volatile content. Consequently, pahoehoe flows commonly are thin characterized by smooth, billowy, hummocky, orropy surfaces and contain large amount of spherical vesicles. Pahoehoe flows are essentially tunnel or tube lava flows: once crusted over on the surface due to cooling, the fluidal lava is less likely to shear apart its crust and thenceforth flows within a tunnel or tube of its own making. A main feeding channel or lava tube, usually thick, is typically associated with a pahoehoe flow unit.

### 2.2 WEATHERING AND EROSION PROCESSES—CAUSE OF ROCKFALL

Weathering and erosion are chiefly responsible in creating rockfall.

Several natural mechanisms contribute to the alteration and breakdown of rocks. Mechanical weathering represents breaking up of rocks by physical disintegration without changing their chemical composition. Chemical weathering involves an alteration in chemical composition and the formation of new minerals. Examples of mechanical or physical weathering are stream and wave erosion, the wedging action of growing plant roots and stems, or the fragmentation of rock faces caused by enlargement of fractures due mainly to gravity. Clay minerals and hydrated iron oxides are typical products of chemical weathering. Due to high temperature and rainfall and abundant vegetation, conditions for chemical weathering are nearly optimum at the Haena State Park site.

Breaking up of the rock by mechanical weathering greatly aids chemical weathering because it increases the area of rock surface exposed to chemical action. Chemical weathering, in return, reinforces mechanical weathering. For example, chemical weathering normally increases the volume of weathered rocks as compared to the original volume of the unweathered rock, setting up stress between the outer more weathered and inner less weathered portions and causing the rock to break apart. The mutual reinforcement of chemical and physical weathering effects is an ongoing process, the degree and rate of which will largely determine the stability of rock in the area.

'A'a flows are especially prone to boulder rockfall due to their differential erosion. The thick and dense interiors of 'a'a flows are relatively resistant to weathering due to their large thickness and low permeability (low porosity). The clinkers, on the other hand, are rapidly eroded away by both

chemical and mechanical weathering. Consequently, overhangs of thick 'a'a interiors are seen almost at every 'a'a flow outcrop. These overhangs are unstable because: (1) the top and bottom supporting layers of the overhangs are poorly cemented and often deeply weathered clinkers; (2) the dense interiors have columnar joints formed naturally by the thermal contraction of lava during cooling; (3) overhangs exert extra stresses on vertical joints and fractures that may increase over time, enlarging the fracture and/or joint spaces. Because it is unlikely for the interior and the clinkers to have similar weathering rates, the only natural way to eliminate a'a interior overhangs is through rock falls or slides. Once dislodged, boulders of the dense interior could roll far due to their large potential energy (large size) and the focus of the energy (without breaking up into small pieces of rocks).

Massive pahoehoe flows (main feeding channels) embedded in thin pahoehoe flows behave similarly as 'a'a interiors. Massive pahoehoe flows are relatively resistant to weathering due to the lack of internal bedding, low permeability, and large thickness. Thin pahoehoe flows, on the other hand, are prone to weathering due to their thin bedding and large amount of vesicles. The piling style of thin pahoehoe in which small oval toes stacked together with little welding-in-between creates adverse geologic structure. Although thin pahoehoe layers themselves are much less prone to boulder rockfall as they easily splinter into small and often flat pieces, their fast differential erosion, however, leads to the overhang of their main feeding channel that could create spectacular rockfall events.

Both a'a and pahoehoe flows are subject to jointing and fracturing where focused weathering occurs. Fracturing and jointing in basalt flows are most commonly initiated as contraction cracks during cooling of lavas. Joints and fractures are enlarged by weathering and gravitational stresses.

Spheroidal weathering is a common form of weathering in which concentric shells of progressively weathered material form around a core of less weathered basalt. Because edges and corners of fractured basalt are exposed to weathering through two or more surfaces, the increased weathering there results in rounding of blocks. Spheroidal weathering produces spherical rocks that could roll easily on a slope.

Over-steepened talus slopes consisting of soil and boulders are prone to rockfall. Rainfalls induce the erosion of soil materials, leaving behind loose and overhanging boulders. During exceptionally heavy rains when the quantity and speed of surface runoff reach certain limits under which the cohesion and gravity of the soil material can be overcome, great quantities of material can be eroded away in relatively a short period of time.

### 2.3 PRECIPITATION—TIMING OF ROCKFALL

Water does not only promote weathering but also a determinant factor in the timing of rockfall events. Due to hydraulic pressure and erosion, rockfall events tend to occur more frequently during or after heavy rains in Hawaii.

The average yearly rainfall for Haena State Park is quite high at about 122 inches per year according to data at rainfall station PH Wainiha 1115 about 1.7 miles away with similar elevation. The precipitation data were taken from the Hawaii State Climate Office at website: <http://umahai.soest.hawaii.edu/Hsco/ppt.htm> The weather station information was taken from the National Climatic Data Center at website: <http://www.ncdc.noaa.gov/ba/climate/surfaceinventories.html#A>

### 2.4 ROCKFALL HAZARD RATING SYSTEM

A rockfall mitigation procedure begins with an understanding of the structural geology and relative orientation of the discontinuities of a slope, the water runoff condition, and the site geometry. To assess potential rockfall hazards, the FHWA and the DOT have sponsored extensive research to develop a series of rockfall mitigation methods and a systematic procedure for rating rockfall

conditions. The results of this research were presented in a series of publications and guidelines *Rockfall Hazard Mitigation Methods* (Publication No. FHWA SA-93-085, March 1994) and *Rockfall Hazard Rating System* (Publication No. FHWA SA-93-057, November 1993). These manuals introduce a multitude of up-to-date techniques and materials to mitigate each condition, hence providing a sense of uniformity during assessment, design, and maintenance. The basic concept behind the DOT/FHWA Rockfall Hazard Rating System is summarized below.

Rockfall rating groups the hazard conditions into three classes, as described below:

- Class A — High estimated potential for rockfall on adjacent property(ies) with high historical rockfall activity. A Class A rating means that the chances of rock falling in a site is moderate to high, and that when the rockfall occurs, it will certainly reach adjacent property(ies). An example of a Class A condition is where rocks on the cut slope overhang the adjacent property(ies) and in areas, between the rockfall property and adjacent property(ies) where little or no rock catchment ditch is present.
- Class B — Moderate estimated potential for a rock to fall on adjacent property(ies) with moderate historical rockfall activity. As the rockfall risk is reduced, a Class B rating indicates that although a rockfall is probable, the chances of it reaching the adjacent properties are low to moderate. A possible scenario for Class B is a condition where a rockfall from the slope is clearly possible, and the catchment ditch is large enough to prevent most of the rocks from reaching the adjacent property(ies).
- Class C — Low estimated potential for rockfall on adjacent property(ies) with low historical rockfall activity. Class C rating pertains to a condition in which there is a low chance for a rockfall event, but should one occur, there is low to no chance for the rocks to reach other properties.

To evaluate a rockfall condition for a given property, certain criteria must be evaluated. These criteria are identified below:

- Slope height
- Ditch or catchment effectiveness
- Structural condition, Case One slopes (movement along discontinuities)
- Rock friction
- Structural condition, Case Two slopes (differential erosion or oversteepening leads to rockfall)
- Difference in erosion rates
- Volume of rockfall event
- Climate and the presence of water on slope
- Rockfall history
- Slope topography

**Slope Height** evaluates the risk associated with the vertical height of a slope. Slope height represents the highest elevation from which a rock could roll down the slope. This value is reasonably estimated from existing topographic maps, through use of a GPS unit, or from trigonometric relationships. High slopes are associated with high rockfall hazard because they have more materials available for rockfall and higher potential energy for rock acceleration. A larger rockfall potential energy is associated with an increased hazard.

The slopes at Haena State Park are high, at places over 1000 ft.

**Ditch Effectiveness** estimates the effectiveness of a catchment ditch or zone in restricting falling rocks from reaching adjacent property(ies). The risk related to a rockfall situation varies based on how effectively a catchment ditch or zone can avert the rocks from reaching the adjacent property(ies). The risk of rocks reaching other property(ies) is lower where a good catchment is in place, regardless of the volume of rock that has fallen. Conversely, the risk heightens where there is limited or no catchment available to stop the falling rocks.

Rockfall catchment varies along the project site. Portions of the mauka side of the Kuhio Highway at Haena State Park have relatively wide flat area with dense trees, providing almost adequate rockfall catchment. Other portions, however, have narrow or no flat area, providing little rockfall catchment.

**Structural Condition.** For the purpose of the rockfall assessment, the geologic conditions of slopes are evaluated based on two distinct cases. Where both rockfall cases are present, the condition that is more severe should be considered.

Case 1. Structural Condition represents slopes for which discontinuities, bedding planes, and joints are the dominant features. Movement within the discontinuities of the slope is the major cause of rockfall for the Case 1 category. "Movement occurs along these joints where the resistance to movement is significantly less than the intact strength of the rock itself. When the joints are oriented adversely to the slope, the potential for rockfall is greater. Adverse joints are those that singularly or in combination with other joints make planar, circular, block, wedge or topping failures kinematically possible" (Pierson and van Vickie 1993, p. 49).

Rockfall movement along structural joints is controlled by the roughness of the joint planes. The degree of roughness ranges from rough and irregular to slickensided. "Friction along a joint, bedding plane, or other discontinuity is governed by the macro and micro roughness of surfaces. Macro roughness is the degree of undulation of the joint relative to the direction of possible movement. Micro roughness is the texture of the surface. On slopes where the joints contain hydrothermally altered or weathered material, movement has occurred causing slickensides or fault gouge to form, or the joints are open or filled with water, the rockfall potential is greater" (Pierson and van Vickie 1993, p. 52).

Case 2. This case represents slope conditions in which differentially eroded rock units and over-steepened slopes are dominant features. Over-steepening of slopes and unsupported rock overhangs increase the risk of rockfall. As described in the RHRS manual, "Rockfall is commonly caused by erosion that leads to a loss of support either locally or throughout a slope. The types of slopes that may be susceptible to this condition are layered units containing more easily erodible units that undermine more durable rock; talus slopes; highly variable units, such as conglomerates, and mudflows, that weather differentially, allowing resistant rocks and blocks to fall; and rock/soil slopes that weather allowing rocks to fall as the soil matrix material is eroded" (Pierson and van Vickie 1993, p. 55).

Where the slope is composed of different rock/soil materials, which exhibit significant differences in composition and characteristics, the rate of erosion may vary within different layers and zones. Progress of soil erosion under these conditions could result in loss of support of portions of the slope, increasing the risk for rockfall.

**Block Size or Volume of Rockfall Event** is evaluated based on individual blocks of rock or a volume of rocks of various sizes. "Larger blocks or volumes of falling rock produce more total kinetic energy and greater impact force than smaller events... the larger the blocks or volume the greater the hazard created..." (Pierson and van Vickie 1993, p.62).

During field investigations, both large and small boulders were identified within this property posing potential hazard.

**Climate and Presence of Water on Slope.** This category evaluates the effects of climate including precipitation, and the presence of water on the slope surface. "Water ... contributes to the weathering and movement of rock materials and a reduction in overall slope stability. This category evaluates the amounts of precipitation ..." (Pierson and van Vickie 1993, p. 65).

Generally a rainfall of 122 inches per year at the site is considered high.

**Rockfall History** at a site is an important indicator of future rockfall activities. Sites with a history of frequent rockfall are more likely to experience future rockfall events. The magnitude of historical rockfalls is also an indicator of future rockfall behavior at a site.

During site investigation, recent rockfall activities were apparent, some of them occurred right adjacent to Kuhio Highway.

Based on the above rating criteria, the rockfall section at the mauka side of Kuhio Highway at Haena State Park consists of both Class A and Class B rockfall ratings.

## 2.5 ROCKFALL COMPUTER SIMULATION

Rockfall is initiated by unbalanced forces as a result of gravity, weathering, erosion, excavation, fracture development, hydraulic pressure, plant or ice wedging, seismic or blasting vibration, or impact by moving objects. After initiation, the fate of rockfall depends on initial momentum, elevation, steepness and roughness of slope, slope material, and the shape and size of the falling rocks. The elevation and size determine potential energy and the shape, slope, and slope material determine the potential acceleration of rockfall.

The Colorado Rockfall Simulation Program (CRSP) version 4.0 (Jones et al. 2000), jointly developed by Colorado School of Mines, Colorado Department of Transportation, and Colorado Geological Survey, simulates rocks tumbling down a slope. The program is based on mathematical models, probability factors, and many rockfall experiments. CRSP can predict the statistical distribution of speed and bouncing height and is a guide and reference for recommending and designing rockfall mitigation. The model takes into account slope profile, rebound and friction characteristics of the slope, and rotational energy of the rocks. The program, together with its values for normal coefficient of restitution ( $R_n$ ) and the tangential coefficient of frictional resistance ( $R_t$ ), has been calibrated by many rockfall events here in Kauai. The model is one of the most widely used and is the recommended tool for the geologist and engineer in analyzing and mitigating rockfall hazards.

CRSP simulations are used to approximate the bouncing height, velocity, kinetic energy, and traveling distance of possible rockfalls. The simulation profiles (cross sections) are based on field measurements taken during investigation. The shape of each boulder is assumed spherical with a 4-foot (ft.) diameter, similar to the large boulders found on the slope. Because CRSP does not include the effect of trees, slope roughness was increased to simulate the effect of tree trunks in stopping falling rocks as dense trees exist at the project site. For each assumed slope profile and boulder, the program mathematically rolls the same boulder down the same slope profile one thousand times and each time it mathematically produces a new slope roughness resulting in a new traveled path by that boulder. It would then issue a percentage for the number of times the hypothetical boulder reaches the end of the run and the jumping height and speed of the boulder at each location of the profile.

Rockfall simulations were performed for five slope profiles on the mauka side of Kuhio Highways at Haena State Park (Figure 1-1). Due to the high elevation and difficulty in access, the top slope profiles were obtained from Google Earth Pro. The bottom of the slope profiles were measured using a measuring tape and a clinometer.

Figure 2-1 shows the simulation results for profile P1 from the gate of the secondary parking lot to the mountain peak (Figure 1-1). A high rock cliff is about 140 feet away from the paved road of Kuhio

Highway, and a relatively flat catchment area exists between the cliff and the road (Figure 1-1 and Figure 2-1). Based on results of this mathematical simulation, about 3% rockfalls reach the road, with a maximum bouncing height of 0.4 foot at the road position (See Appendix A for detailed simulation information). This rockfall section represented by profile P1 would entail Class B rockfall rating.

Figure 2-2 shows the simulation results for profile P2. Unlike profile P1, profile P2 has a long and steep talus slope leading to a high rock cliff (Figure 1-1 and Figure 2-1). About 63% of simulated rockfalls originated from the top of the mountain are anticipated to reach the road, with a maximum bouncing height of 9 feet at the road position (See Appendix A for detailed simulation information). This rockfall section represented by profile P2 would entail Class A rockfall rating.

Figure 2-3 shows the simulation results for profile P3 at the start of the beaching parking lot (Figure 1-1). Profile P3 has a relatively flat catchment area and a steep talus slope before a high rock cliff (Figure 1-1 and Figure 2-3). About 4% of simulated rockfalls originated from the top of the mountain are anticipated to reach the road, with a maximum bouncing height of 1.6 feet at the road position (See Appendix A for detailed simulation information). This rockfall section represented by profile P3 would entail Class B rockfall rating.

The Wet Cave (Wai a Kanaloa) exists between profiles P2 and P3, in between locations of boulders B21 and B20 shown in Figure 1-1. Here high rock cliff is right next to the paved road. Most, if not all, rockfalls would reach the road. This rockfall section including the Wet Cave (Wai a Kanaloa) is considered Class A rockfall rating.

Figure 2-4 shows the simulation results for profile P4 at the start of the Kalalau trail (Figure 1-1). Profile P4 has a relatively flat catchment area and then a short steep talus slope before a ridge (Figure 1-1 and Figure 2-4). About 0.5% of simulated rockfalls originated from the top of the mountain reach the road, with little or no bouncing at the road position (See Appendix A for detailed simulation information). This rockfall section represented by profile P4 would entail Class B rockfall rating.

Figure 2-5 shows the simulation results for profile P5 starting from the most populated beach area (Figure 1-1). Profile P5 has some relatively flat catchment areas and a long talus slope before a high ridge (Figure 1-1 and Figure 2-5). Profile P5 crosses the Kalalau trail which helps to stop falling rocks due to its depression formed by erosion along the trail. No simulated rockfalls originated from the top of the mountain would reach the beach area (See Appendix A for detailed simulation information). Rockfalls started from the steep slope right next to the beach, however, could reach the beach area. This rockfall section represented by profile P5 would entail Class B rockfall rating.

Figure 2-1: Rockfall simulation results for profile P1.

Vertical axis is elevation (foot) and horizontal axis is distance from rockfall source (foot). Each small dot represents the position of a boulder during rockfall. AP1 is analysis points at road position. The numbers (1, 3, 5, ..., 23) are slope section references. Upper slope profile was obtained from Google Earth Pro and lower slope profile was measured. About 3% rockfalls reach the road, with a maximum bouncing height of 0.4 foot. See Appendix A for detailed simulation information.

Figure 2-2: Rockfall simulation results for profile P2.

Vertical axis is elevation (foot) and horizontal axis is distance from rockfall source (foot). Each small dot represents the position of a boulder during rockfall. AP1 is analysis points at road position. The numbers (1, 3, 5, ..., 17) are slope section references. Upper slope profile was obtained from Google Earth Pro and lower slope profile was measured. About 63% rockfalls reach the road, with maximum bouncing height of 9 feet. See Appendix A for detailed simulation information.

Figure 2-3: Rockfall simulation results for profile P3.

Vertical axis is elevation (foot) and horizontal axis is distance from rockfall source (foot). Each small dot represents the position of a boulder during rockfall. AP1 is analysis points at road position. The numbers (1, 3, 5, ..., 17) are slope section references. Upper slope profile was obtained from Google Earth Pro and lower slope profile was measured. About 4% rockfalls reach the road, with maximum bouncing height of 1.6 feet. See Appendix A for detailed simulation information.

**Figure 2-4: Rockfall simulation results for profile P4.**

Vertical axis is elevation (foot) and horizontal axis is distance from rockfall source (foot). Each small dot represents the position of a boulder during rockfall. AP1 is analysis points at road position. The numbers (1, 3, 5, ..., 11) are slope section references. Upper slope profile was obtained from Google Earth Pro and lower slope profile was measured. About 0.5% rockfalls reach the road, with maximum bouncing height of 0.0 foot. See Appendix A for detailed simulation information.

**Figure 2-5: Rockfall simulation results for profile P5.**

Vertical axis is elevation (foot) and horizontal axis is distance from rockfall source (foot). Each small dot represents the position of a boulder during rockfall. AP2 is analysis point at beach positions. The numbers (1, 3, 5, ..., 25) are slope section references. Upper slope profile was obtained from Google Earth Pro and lower slope profile was measured. No simulated rockfalls reach the beach position. See Appendix A for detailed simulation information.

## 2.6 ROCKFALL SITES AND POTENTIAL ROCKFALL HAZARDS AT HAENA STATE PARK

Due to the time-consuming nature of rappelling and safety issues regarding high mountains and the requirement of this planning study, the high cliffs and high ridge tops were only observed from a distance where they could be viewed from nearby vantage points.

Three factors determine the hazard level of potential rockfall outcrops: how likely they are going to fall (chance of rockfall); once they fall, how likely they are going to hit the target to be protected (chance of hitting target); and how large their size or volume (rockfall size or volume) would be.

For chance of rockfall, the following four categories are considered

- Category 1: Imminent potential for rockfall (could fall anytime). There are no visible signs of competent support and the rocks could fall any time. Observed rock characteristics include but not limited to: 1) loose boulders or completely

separated rocks lacking toe and interlocking support and sitting on planes dipping out of slope with dipping angles significantly greater than friction angles; 2) rounded loose boulders sitting on steep soil slope with little embedment and weakened soil support that is subjected to great potential for further erosion; 3) overhang with opened release joints without observed competent interlocking; 4) loose boulders or fractured rocks sitting in a position that is at or very close to toppling or losing balance; 5) failing key supporting stones.

**Category 2:** Short term potential for rockfall. There are visible signs of support that will diminish relatively quickly with time (within several to a dozen years. Time scale is used symbolically and should not be understood or interpreted as actual time length) but nonetheless most likely prevents immediate rockfall at present. Loose boulders or fractured rocks have short term rockfall potential when having one or more of the following characters: 1) supported by soil or mixture with soil that is being subjected to rapid erosion; 2) supported by old, dying, or dead vegetation; 3) supported by interlocking that is unlocking due to continuously opening fractures; 4) weakening key supporting stones that show signs of stress like sliding and fracturing; 5) in the process of making small scale adjustments through local rotating or sliding towards a position of eventual rockfall.

**Category 3:** Medium term potential for rockfall. There are visible signs of stable support that prevent rockfall at present and diminish within medium length of time period (within dozens of years). The boulders or rock outcrops are currently in a stable position but are working their way to eventual rockfall due to stress, erosion, weathering, root wedging, hydraulic pressure, and other destabilizing forces.

**Category 4:** Long term potential for rockfall. There are visible signs of solid support that will diminish within a long period of time (up to or more than a hundred years). Destabilizing forces will take many years to develop new rockfall features.

Categories in between the above four categories are also used. For example, Category 1.5 simply indicates the chance of rockfall is between Category 1 and Category 2.

Representative rock outcrops, their sizes, locations, and categories are listed in Table 2-1 and their relative locations are plotted in Figure 1-1.

Photo 2-1 shows round boulder on steep slope at B1. Photo 2-2 shows highly fractured and weathered steep slope with many loose rocks at B3, with a recent rockfall source. Photo 2-3 shows an overhanging and standing boulder with large opened back fracture at B4. Photo 2-4 shows a completely overhanging boulder with steep back fracture dipping out of slope at B5. Photo 2-5 shows loose boulders on talus slope at B7. Photo 2-6 shows root wedging that enlarged fractures at B12. Photo 2-7 shows a recent fallen boulder at B14. Photo 2-8 shows recent fallen boulders with fresh impact marks on the trees. Photo 2-9 shows old impact marks on a tree and stopped boulders. Photo 2-10 shows a rock perched on tree branches at B17. Photo 2-11 shows a recent rockfall boulder, with fresh impact marks and tree barks on it, on steep slope with potential for further fall at B18. Photo 2-12 shows an overhanging boulder partly supported by rotten tree roots at B19. Photo 2-13 shows an overhang loose boulder on steep slope at B19. Photo 2-14 shows a loose boulder on steep slope at B20 above Kuhio Highway. Photo 2-15 shows rocks stopped by a tree just above Kuhio Highway at B21. Photo 2-16 shows recent rockfall boulders and fresh impact marks on trees at B21. Photo 2-17 shows recent rockfall boulders perched on tree roots and fresh impact marks on trees at B21. Photo 2-18 shows the source of the recent rockfall at B21. Photo 2-19 shows an overhanging fractured rock with potential for wedge failure at B21. Photo 2-20 shows fractured and overhanging rocks at B21. Photo 2-21 shows an opened columnar joint of a dike at B21. Photo 2-22 shows a major fracture separating a small ridge from the main rock slope at B21. Photo 2-23 shows overhanging and fractured rocks at B23. Photo 2-24 shows a protruding rock sitting on a steep fracture dipping out of slope at B25. Photo 2-25 shows an overhanging loose rock sitting on top of a ledge at B26. Photo 2-26 shows overhanging loose boulders on a steep talus slope just above a very popular beach area at B30. Photo 2-27. Overhanging loose boulders on a steep talus slope at B30.

Photo 2-28 shows an overhanging fractured rock on a high cliff face (photo taken from vantage point V1). Photo 2-29 shows an overhanging and fractured block on top of a high cliff face (photo taken from vantage point V2). Photo 2-30 shows a major fracture separating a large block on a high rock cliff (photo taken from vantage point V2). The block dropped a little distance as indicated by the shifts of major layers across the fracture. Photo 2-31 shows a recent rockfall source and a large overhanging rock with back fractures (photo taken from vantage point V2). Photo 2-32 shows an overhanging portion of a high cliff (photo taken from vantage point V3). Photo 2-33 shows loose boulders perched on a steep ridge (photo taken from vantage point V1). Photo 2-34 shows an overhanging large boulder on the very top of a high slope (photo taken from vantage point V5). Photo 2-35 shows the thick lava flow layer on the very top of the high slopes (photo taken from vantage point V5).

Table 2-1: Representative Identified Potential Rockfall Outcrops at Haena State Park, Kauai.

| Location | Category | Size            | Number of rocks | Latitude (°) | Longitude (°) |
|----------|----------|-----------------|-----------------|--------------|---------------|
| B1       | 1.5      | 4 x 3 x 2.6     | 1               | 22.21842     | -159.58562    |

Note: Size is length x height x depth; Latitude and Longitude are in NAD 83

## 2.7 ROCKFALL RISK ESTIMATION FOR THE HAENA STATE PARK SITE

The risk estimation of rockfalls and landslides involves the integration of their frequency and consequences. Because the United States has yet to develop a guideline for rockfall and landslide risk management, the guideline developed by the Australian Geomechanics Society (AGS) that has been used by many countries is used as a reference (AGS 2000).

For loss of life, the risk can be calculated from:

$$R_{(DI)} = P_{(H)} \times P_{(S,H)} \times P_{(T,S)} \times V_{(D,T)}$$

Where  $R_{(DI)}$  is the risk (annual probability of loss of life (death));  $P_{(H)}$  is the annual probability of the hazardous events (the landslides or rockfalls);  $P_{(S,H)}$  is the probability of spatial impact by the hazard (e.g. probability of landslides impacting structures (locations) taking into account travel distance);  $P_{(T,S)}$  is the temporal probability (e.g. probability of the structure being occupied);  $V_{(D,T)}$  is the vulnerability (probability of loss of life of individuals given the impacts).

For existing slopes, the suggested tolerable risk for loss of life is  $10^{-4}$  for persons most at risk and  $10^{-5}$  for average persons; for new slopes, the suggested tolerable risk for loss of life is  $10^{-5}$  for persons most at risk and  $10^{-6}$  for average persons (AGS 2000).

For property, the risk can be calculated from:

$$R_{(Prop)} = P_{(H)} \times P_{(S,H)} \times V_{(Prop,S)} \times E$$

Where  $R_{(Prop)}$  is the risk (annual loss of property value);  $P_{(H)}$  is the annual probability of the hazardous event;  $P_{(S,H)}$  is the probability of spatial impact by the hazard (i.e. of the landslide impacting the property, taking into account the travel distance) and for vehicles, for example, the temporal probability;  $V_{(Prop,S)}$  is the vulnerability of the property to the spatial impact (proportion of property value lost);  $E$  is the element at risk (e.g. the value or net present value of the property).

A full risk analysis involves consideration of all landslide and rockfall hazards for the site and all the elements at risk. Unless extensive geotechnical testing and observations over a very long period are available, this risk calculation depends heavily on the estimator's experience and availability of data and is meant only as a first order approximation.

To estimate the rockfall risk or annual loss of life, we use  $P_{(H)} = 0.5$  (one major rockfall every two years along the 3050 ft long rockfall section);  $P_{(S,H)} = 14\% \times 15 \text{ ft} / 3050 = 0.00069$ , namely 14% rockfalls reach or pass the road (average of the five rockfall simulation profiles) and each rockfall impacts 15 ft width (car length) of the 3050 ft width;  $P_{(T,S)} = 3050 \text{ ft} / 5280 \text{ ft per mile} / 15 \text{ mph} / 24 \text{ hour} \times 1550 \text{ vehicle per day} \times 2.5 \text{ persons each vehicle} = 6.22$ , and  $V_{(D,T)} = 0.3$  as vehicles are likely not to be buried by a rockfall (AGS 2000). Therefore the annual probability of loss of life at this site of the road is  $0.5 \times 0.00069 \times 6.22 \times 0.3 = 6.4 \times 10^{-4}$ , higher than the recommended tolerable level of  $10^{-5}$  for general public. Rockfall mitigation is recommended for Haena State Park to reduce rockfall risk to park users. If the park is limited to 900 visitors per day with the visitors walking on the highway along the rockfall section (from the main parking to the beach), we have  $P_{(T,S)} = 3050 \text{ ft} / 5280 \text{ ft per mile} / 2.5 \text{ mph} / 24 \text{ hour} \times 900 = 8.66$  (assuming walking speed at 2.5 mph) and  $V_{(D,T)} = 0.35$  (increased fatality without the protection from vehicles), and the annual probability of loss of life at this site is  $0.5 \times 0.00069 \times 8.66 \times 0.35 = 1.0 \times 10^{-3}$ . Calculated rockfall risk would increase significantly if visitors spend time at the two wet caves.

Photo 2-1. Round boulder on steep slope. At B1.

Photo 2-2. Highly fractured and weathered steep slope with many loose rocks. At B3. The foreground is a recent rockfall source.

Photo 2-3. An overhanging and standing boulder with large opened back fracture At B4.

Photo 2-4. A completely overhanging boulder with steep back fracture dipping out of slope. At B5.

Photo 2-5. Loose boulders on talus slope At B7.

Photo 2-6. Root wedging enlarged fractures At B12.

Photo 2-7. A recent fallen boulder. At B14.

Photo 2-8. Recent fallen boulders. Notice the fresh impact marks on the trees.

Photo 2-9. Old impact marks on the tree and stopped boulders.

Photo 2-10. A rock perched on tree branches At B17.

Photo 2-11. A recent rockfall boulder on steep slope with potential for further fall. Notice the fresh impact marks and tree barks on the boulder. At B18.

Photo 2-12. An overhanging boulder partly supported by rotten tree roots At B19.

Photo 2-13. An overhang loose boulder on steep slope. At B19.

Photo 2-14. A loose boulder on steep slope. Notice Kuhio Highway down below At B20.

Photo 2-15. Rocks stopped by a tree. Notice the traffic on Kuhio Highway below. At B21.

Photo 2-16. Recent rockfall boulders and fresh impact marks on trees (pointed by the arrows). Notice Kuhio Highway below At B21.

Photo 2-17. Recent rockfall boulders perched on tree roots and fresh impact marks on trees (pointed by the arrows). Notice Kuhio Highway below At B21.

Photo 2-18. The source (pointed by the arrow) of the recent rockfall At B21.

Photo 2-19. An overhanging fractured rock (pointed by the arrow) with potential for wedge failure. Notice fractured rocks on the cliff face at left of the photo. At B21.

## 2.8 SUPPLEMENTAL ROCKFALL COMPUTER SIMULATION

To meet the design requirement of the master planning of Haena State Park, rockfall computer simulations were performed for six additional slope profiles (N0, N1, N2, N3, N4, and N5, see Figure 2-6) on both sides of simulation profile P2.

Contour maps with limited control points, like Google Earth Pro and regular survey maps, invariably smooth slope profiles and adversely impact rockfall simulation. For example, there are many very high and near vertical cliff faces at Haena State Park but none could be found in Google Earth Pro. Small rockfall launching benches and pads are also missing in Google Earth Pro due to its smoothing. Rockfall simulation based on contour maps with limited control points should be regarded only as a first order approximation. Site measurement has to be made for more accurate rockfall simulations. For very long slope profiles with emphasis at slope bottoms, however, it does not make much difference whether the top slopes are measured on site or obtained from contour maps.

To overcome the smoothing of contour maps for this supplemental rockfall simulation, the high and steep top slope profiles were estimated using a laser range finder and a clinometer to catch major cliff faces and launching benches and pads. Only those major cliff faces that were visible at advantageous view points at slope bottom were measured using the laser range finder. Both the direct and horizontal distances to both cliff top and bottom were measured for each major cliff face. Gentler slopes between major cliff faces were constrained by their slope angle estimated using the clinometer and the height and distances of two adjacent major cliff faces. Bottom slope profiles were directly measured using a tape and a clinometer.

Figure 2-7 shows the simulation results for profile N0 (Figure 2-6). A small launching pad existed on top of the bottom major cliff (Figure 2-7). Based on results of this mathematical simulation, about 81%, 38%, and 0.0% simulated rockfalls reach mauka edge, makai edge, and 60 ft down the makai edge of the paved road, respectively, with a maximum bouncing height of 18 ft, 1.5 ft, and 0.0 ft, respectively. 8.7% and 3.4% simulated rockfalls passed the points at 20 ft and 30 ft down the makai edge of the paved road, respectively. See Appendix A for detailed simulation information. If without the small launching pad, the maximum jumping height at the mauka edge of the paved road would be only 2.1 ft (compared to the 18.3 ft), with other results very similar to the above.

Figure 2-8 shows the simulation results for profile N1. A small launching pad existed on top of the bottom major cliff (Figure 2-8). Based on results of this mathematical simulation, about 100%, 65%, and 5.6% simulated rockfalls reach mauka edge, makai edge, and 60 ft down the makai edge of the paved road, respectively, with a maximum bouncing height of 150 ft, 116 ft, and 4.7 ft, respectively. 4.0% and 0.5% simulated rockfalls passed the points at 64 ft and 94 ft down the makai edge of the paved road, respectively. See Appendix A for detailed simulation information. If without the small launching pad, about 98%, 60%, and 4.8% simulated rockfalls reach mauka edge, makai edge, and 60 ft down the makai edge of the paved road, respectively, with a maximum bouncing height of 102 ft, 61 ft, and 1.0 ft, respectively. 1.6% simulated rockfalls passed the point at 74 ft down the makai edge of the paved road. See Appendix A for detailed simulation information.

Figure 2-9 shows the simulation results for profile N2. Profile N2 passes the upper wet cave (Waiakapalae). Based on results of this mathematical simulation, about 100%, 17%, and 0.3% simulated rockfalls reach the upper Wet Cave (Waiakapalae), the mauka edge, and the point 60 ft down the makai edge of the paved road, respectively, with a maximum bouncing height of 166 ft, 2.3 ft, and 0.3 ft, respectively. 3.4% simulated rockfalls passed the point 5 ft down the makai edge of the paved road. See Appendix A for detailed simulation information.

Figure 2-10 shows the simulation results for profile N3. Based on results of this mathematical simulation, about 100%, 100%, and 40% simulated rockfalls reach mauka edge, makai edge, and 60 ft down the makai edge of the paved road, respectively, with a maximum bouncing height of 96 ft, 77 ft, and 20 ft, respectively. 5.7% and 2.3% simulated rockfalls passed the points at 89 ft and 99 ft

2-39

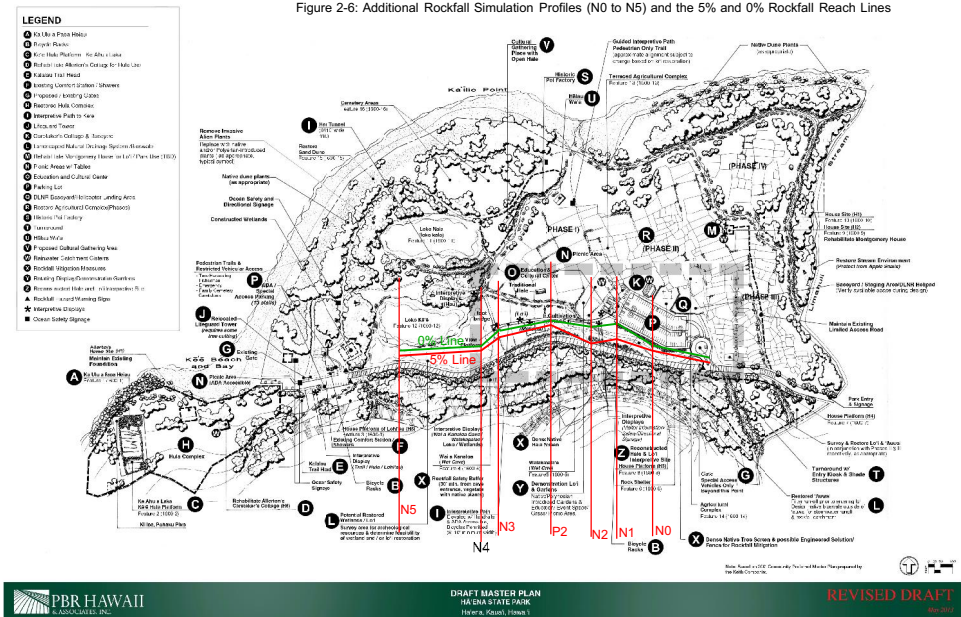

down the makai edge of the paved road, respectively. See Appendix A for detailed simulation information.

Figure 2-11 shows the simulation results for profile N4. Based on results of this mathematical simulation, about 100%, 94%, and 14% simulated rockfalls reach the lower Wet Cave (Wai a Kanaloa), mauka edge, and the point 60 ft down the makai edge of the paved road, respectively, with a maximum bouncing height of 159 ft, 106 ft, and 0.7 ft, respectively. 2.7% and 0.0% simulated rockfalls passed the points at 74 ft and 94 ft down the makai edge of the paved road, respectively. See Appendix A for detailed simulation information.

Figure 2-12 shows the simulation results for profile N5. Based on results of this mathematical simulation, about 84%, 9%, and 0% simulated rockfalls reach mauka edge, makai edge, and 60 ft down the makai edge of the paved road, respectively, with a maximum bouncing height of 5.7 ft, 0.7 ft, and 0.0 ft, respectively. 1.4% simulated rockfalls passed the point at 36 ft down the makai edge of the paved road. See Appendix A for detailed simulation information.

The results of these additional rockfall computer simulations were summarized in Figure 2-6, with the 0% line indicating no simulated rockfalls pass the location indicated by the lines, and the 5% line indicating five percent of simulated rockfalls pass the location indicated by the lines. Figure 2-13 shows rockfall simulation results with minimum mitigation measures in place. Notice the change of the 0% line and 5% line in Figure 2-13 compared to in Figure 2-6. A drainage/catchment ditch or a low wall can be designed along or down slope of the 0% line in Figure 2-13 to stop rockfalls from going any further. Figure 2-14 shows the drainage/catchment ditch mitigation option where a drainage ditch is installed along the 0% line in Figure 2-13. Figure 2-15 shows the drainage ditch and elevated path mitigation option where a drainage ditch is installed right along the roadway to stop most falling rocks and the elevated height of the path to stop the remaining falling rocks.

**Figure 2-7: Rockfall simulation results for profile N0.**

Vertical axis is elevation (foot) and horizontal axis is distance from rockfall source (foot). Each small dot represents the position of a boulder during rockfall. AP1, AP2, and AP3 are analysis points at the mauka edge, makai edge, and 60 ft down the makai edge of the paved road. The numbers (1, 3, 5, 7...) are slope section references. Upper slope profile was estimated using a laser range finder and a clinometer and lower slope profile was measured. About 81%, 38%, and 0% rockfalls reach analysis points AP1, AP2, and AP3, respectively, with a maximum bouncing height of 18.3 ft, 1.5 ft, and 0 ft, respectively. See Appendix A for detailed simulation information. If without the small launching pad indicated in the above figure, the maximum jumping height at AP1 would be 2.1 ft, with other results very similar to the above.

**Figure 2-8: Rockfall simulation results for profile N1.**

Vertical axis is elevation (foot) and horizontal axis is distance from rockfall source (foot). Each small dot represents the position of a boulder during rockfall. AP1, AP2, and AP3 are analysis points at the mauka edge, makai edge, and 60 ft down the makai edge of the paved road. The numbers (1, 3, 5, 7...) are slope section references. Upper slope profile was estimated using a laser range finder and a clinometer and lower slope profile was measured. About 100%, 65%, and 5.6% simulated rockfalls reach analysis points AP1, AP2, and AP3, respectively, with a maximum bouncing height of 150 ft, 116 ft, and 4.7 ft, respectively. If without the small launching pad, about 98%, 60%, and 4.8% simulated rockfalls reach AP1, AP2, and AP3, respectively, with a maximum bouncing height of 102 ft, 61 ft, and 1.0 ft, respectively. See Appendix A for detailed simulation information.

## Engineering Planning Study

Figure 2-15: Drainage/Catchment Ditch and Elevated Walk Path Mitigation

### 3.0 ENGINEERING PLANNING STUDY

#### 3.1 ROCKFALL ENGINEERING MITIGATION METHODS

This section provides typical narratives and schematic drawings for engineered rockfall mitigation solutions. These solutions are among the most widely used rockfall mitigation methods in the industry.

There are two general ways of approaching engineering mitigation solutions: permanent and temporary. Permanent mitigation solutions provide a high level of protection against falling rocks for the entire site with the intent to remain effective for many years (the design life of the system used). The first six mitigation methods described below, from wire mesh drape system to retaining wall, are permanent design alternatives. Temporary design alternatives usually provide emergency or cost-effective rockfall hazard reduction, usually do not provide full hazard protection coverage of a rockfall site, and may need to be re-visited or repeated periodically as new rockfall features develop. The use of temporary methods must be based strictly on the results of a risk management process initiated by the owner of the project. Temporary methods are preferred by property owners when there is a need for emergency rockfall hazard reduction, permanent mitigation is cost prohibitive, or funding for permanent mitigation is not available. Scaling of rocks described below is a temporary rockfall mitigation method.

##### 1. DESIGN ALTERNATIVE NO. 1- WIRE MESH DRAPE SYSTEM

Design Alternative No. 1 provides for the installation of wire mesh or ringnet drape system over entire slope that could send falling rocks to roadways or other protected structures. As shown in Figure 3-1, the draped wire mesh or ringnet should be anchored at the top of the slope and extend to the bottom. Falling debris are restrained behind the drape. Debris would be deposited into a small catchment area at the base.

This design alternative requires periodic inspection and maintenance. The mesh should be inspected for corrosion and damage from falling debris. Steel components may need to be repaired or replaced. Rockfall debris should be cleared from behind the mesh and from the catchment area.

The main benefit of this design alternative is that the mesh covering offers a high level of rockfall protection. This system can be installed in places where limited catchment area prevents the use of other systems like the rockfall impact fence and catchment ditch zone. This system is cost effective for small slopes with limited catchment area. The drawbacks of this design alternative are visual impact and the high initial construction cost.

Wire mesh drape system is not suitable for Haena State Park: 1) it is cost-prohibitive at a cost of 206.5 million dollars (see Appendix B for cost estimate) and a construction time of 8 months, and 2) although vegetation would grow through mesh openings, portions of the mesh covering bare rocks may become visible creating an aesthetic drawback.

##### 2. DESIGN ALTERNATIVE NO. 2- ANCHORED WIRE MESH SYSTEM

Design Alternative No. 2 provides for the installation of anchored wire mesh over the entire slope that could otherwise send falling rocks onto roadways or other protected structures. After cleaning, scaling and leveling, the terrain surface is covered by a high strength steel wire mesh and tensioned with pre-installed anchors typically spaced 8 to 10 feet apart throughout the coverage area, as shown in Figure 3-2. The anchors pull the mesh tightly against the slope. This system is designed to prevent rockfalls by restraining the loose material in place. If the slope has large scale landslide potential, the anchors can be designed to stabilize the slope.

This design alternative requires periodic inspection and some maintenance where required. As with all anchored wire mesh systems, the steel components must be inspected for signs of corrosion, fatigue, and damage. Parts may require repair or replacement if damaged.

The benefit of using this design alternative is that it stabilizes slope and restrains loose material in place. The wire mesh held tightly against the slope improves soil retention and vegetation growth for a natural green appearance making the wire mesh virtually invisible. The system can be integrated to accommodate trees and other existing slope features. Furthermore, this system requires no catchment zone, and therefore can be installed practically at any area where other mitigation systems are ineffective. The drawbacks of this alternative are high initial construction cost and that the area beneath the wire mesh becomes unusable.

Anchored wire mesh system is not suitable for Haena State Park: 1) it is cost-prohibitive at a cost of 340.4 million dollars (see Appendix B for cost estimate) and a construction time of about 12 months, and 2) although vegetation grows through mesh openings, the mesh could become visible where covering rock outcrops. This may be unacceptable for a State park that is renowned for its natural beauty.

##### 3. DESIGN ALTERNATIVE NO. 3- IMPACT FENCE SYSTEM

Impact fence system provides for the installation of a rockfall impact fence along the shoulder or toe of slope to intercept rolling rocks from upslope (see Figure 3-3). The fence provides blanket rockfall protection for large areas. The system can be designed to absorb various levels of energy and jumping heights produced from falling rocks for specific site conditions.

This design alternative requires periodic maintenance to repair the fence. Braking elements need to be checked and replaced, if necessary, after each major impact. Rocks embedded in the fence should be removed.

Large slopes can be mitigated with a single fence installed at the base thus making this design alternative beneficial. The main drawback is the catchment area required. Sites with launching features or little shoulder room may require widening or realignment to accommodate the fence. Additional drawbacks include periodic maintenance costs and some visual impact.

Impact fence system is suitable for most areas of Haena State Park with a cost of 8.6 million dollars (see Appendix B for cost estimate) and a construction time of about 6 months. The impact fence will mostly be hidden from view by trees and other vegetation so its adverse aesthetic impact is limited.

##### 4. DESIGN ALTERNATIVE NO. 4 - COMBINATION IMPACT FENCE AND DRAPE OR ANCHORED WIRE MESH SYSTEM

This alternative is a combination of Design Alternative No. 2 and No. 3. It includes installation of a rockfall impact fence in strategic locations to intercept falling rocks and a draped or anchored wire mesh system over steep slopes that are right next to protected structures with no catchment zone in between for the installation of an impact fence (see Figure 3-4). The fence would provide blanket rockfall protection intercepting rolling rocks from upslope, and the anchored wire mesh system would inhibit rockfalls just above protected structures.

This system is most beneficial for areas with limited shoulder having high continuous natural slopes. The drawback is the higher construction cost and some visual impact.

Impact fence and anchored wire mesh system is suitable for Haena State Park with a cost of 9.8 million dollars (see Appendix B for cost estimate) and construction time of about 9 months. The impact fence will mostly be hidden from view by trees and other vegetation so its adverse aesthetic

impact is limited. The anchored wire mesh system is mainly installed at the area around the Wet Cave (Wai a Kanaloa) where high steep cliffs are right next to roadway and popular visitor areas.

#### 5. DESIGN ALTERNATIVE NO. 5- CATCHMENT DITCH

Design Alternative No. 5 provides for the construction of a catchment ditch along the shoulder, as shown by Figure 3-5. The ditch should be designed based on site conditions to provide adequate catchment zone. Roads with little shoulder width will require partial cutting of the slope or realignment of the road in order to accomplish the designed effects.

This design alternative requires low maintenance. The ditch should be cleared of rockfall debris periodically.

This design alternative is beneficial because large slopes can be mitigated with a single catchment ditch along the base. Also, the ditch improves drainage capacity. The drawback is associated with the large catchment zone area and rock excavation required. Additionally, existing utilities along the shoulder may require modification or relocation.

Catchment ditch is suitable for Haena State Park with a cost of 6.8 million dollars (see Appendix B for cost estimate) and a construction time of about 8 months. An anchored wire mesh system is needed at the area around the Wet Cave (Wai a Kanaloa) where high steep cliffs are right next to roadway and popular visitor areas with no room for a catchment ditch. Impact fences may be needed in locations where a catchment ditch is not effective in intercepting falling rocks. The position and dimension of the catchment ditch should be verified by rockfall simulation at each location.

#### 6. DESIGN ALTERNATIVE NO. 6- ROADWAY REALIGNMENT

Design alternative No. 6 provides for construction of a new realigned roadway parallel to the existing road where the existing roadway is too close to the mountain. The new roadway will be constructed on the makai side of the existing road using fill material and mechanically stabilized earth (MSE) walls as necessary. The existing road will be used as a rock catchment area. An impact protection fence will be installed in areas where the new road is still in close proximity to the rockfall path. This design alternative requires some ground excavation and backfilling. With the roadway pushed away from the mountain side, the access to the caves could easily become limited for public safety and hazard control.

The construction cost to realign the roadway and installation of the necessary safety features is estimated at \$15.5 M (see Appendix B for cost estimate) with a construction time of about 12 months.

The benefits of this design alternative include low maintenance, longevity, and simplicity and effectiveness of design. The drawback is increased construction costs. This design alternative is very suitable for Haena State Park.

#### 7. DESIGN ALTERNATIVE NO. 7- ROCK SCALING (TEMPORARY FIX)

During scaling, rock outcrops that are ready to fall are removed from the slope by using hands, prying bars, and hydraulic jacks or airbags for large rocks. Scaling is most cost-effective when there are no structures to be protected at the base of the slope where the scaled rocks are allowed to run down the slope freely. The only significant structure at Haena State Park is the paved road surface which, if damaged during scaling, can be easily repaired by patching the impact holes made by scaled rocks. Alternatively, metal plates or other road covers can be used to reduce damage to the paved road at additional cost.

After a thorough scaling, the rockfall hazard is generally maintained at a low level for quite a few years because the geological processes associated with natural production of rockfalls are generally slow requiring many years to generate a rock outcrop that is ready to fall. Exceptions, however, exist. For example, if a new water channel develops on a steep soft soil slope with embedded boulders, new rockfall hazards will be created after almost every surface runoff. The slopes at Haena State Park consist of nearly horizontal lava flow layers with limited weathering and talus slopes with limited fine or soil material. The geological processes associated with natural production of rockfalls at Haena State Park are reasonably slow.

The steep slopes around the Wet Cave (Wai a Kanaloa) are the most hazardous at Haena State Park and should be scaled first. The area around Profile P2, which is close to both wet caves, has the highest percentage of potential rockfalls anticipated to reach the roadway and should be scaled first. The other areas have low percentage (less than 5%) of rockfalls reaching roadway or beach and should be scaled if additional funding is available. The cost of scaling is \$750,000 for two crews of three scalars each crew to work for 75 days (daily cost \$10,000) to scale the wet caves' area and above, and the identified boulder sites (B1 to B30). Scaling of large rocks in other areas that have a reasonable chance of reaching roadway or beach or other structures is recommended if additional funding is available, with an estimated additional cost at 1.5 million dollars.

During rock scaling operation, it is highly recommended that the contractors' scope of work is directed and validated on site by geologists or engineers experienced in rock scaling.

#### 7. OTHER MITIGATION METHODS

There are many other rockfall mitigation methods. Rock demolition, bolting, cable lashing, pedestal support, and local netting can be used independently or in combination with other mitigation methods. High-cost methods like constructing concrete canopy, or elevated roadways above rock fallout zones can also be used if specific conditions warrant the high costs.

#### 3.2 RECOMMENDED ROCKFALL MITIGATION DESIGN AT HAENA STATE PARK

Design for the mitigation alternatives are based on factors such as public safety, least impact to the environment, construction cost, and sound engineering principles. The recommendations were provided to develop preliminary construction cost data used to establish project development and funding. The final remedial design may vary from the preliminary design based on other factors including detailed rockfall protection characteristics, land acquisitions, community needs, environmental issues, cultural considerations, aesthetics, and local politics.

For permanent rockfall mitigation design, the combination of impact fence and anchored wire mesh system is recommended due to its effectiveness, and least disturbance to environment with a cost of about 9.8 million dollars and a construction period of eight months.

For temporary rockfall mitigation design, scaling is recommended due to its ease of construction, least disturbance to environment, and cost effectiveness in rockfall hazard reduction, with a cost of \$750,000 and a construction period of four months to scale the high hazard areas around both Wet Caves and the identified boulder sites. It should be noted that rock scaling is a temporary solution and should only be used to reduce rockfall potentials. For an engineered rockfall protection methodology any of the permanent mitigation methods may be considered. An additional 1.5 million dollars and a construction period of six months are needed to scale the remaining other areas. Only rocks that are likely to reach the roadway or other protected structures will be scaled.

It has been noted that the North Shore and specifically the Haena communities have been resistive to any disturbance and potential devastation to the sacred mountains at Haena brought about as the result of any rockfall mitigation and construction. Consequently, there are various other plans being

drawn up in cooperation with the community in terms of long term and short term mitigation on for rockfall protection in this area. The long term plan is to divert the public traffic away from the high rockfall zones. This would be accomplished by closing the highway to both vehicular and on-foot public travelers while redirecting them through walkways that are built in the safe rockfall zones. This is part of a master planning process that the State is currently working on with the public. The proposed facilities and pathways for the master planning of Haena State Park are outside of rockfall reach zones (Figure 2-6). To further increase rockfall protection, the proposed pathways can be elevated by 2 ft (Figure 3-6) and the proposed parking lot can be fronted at mauka side by a drainage/catchment ditch with 2 ft depth (Figure 3-7), as suggested by the simulations shown in Figure 2-13, Figure 2-14, and Figure 2-15. The cost of such improvements would vary depending on a number of factors including the topographic survey, soil condition, ground water levels, cultural interests, and so on, and is best to remain for determination during design phase.

For the short term mitigation solution and in the interim, we are proposing demolition and stabilization of some of the larger rocks (a total of 4 to 6 rocks) along the base of the mountain near the areas of the Wet caves. The way this procedure has been proposed is to remove each unstable rock using rock scaling bars or airbags only. Once these rocks are dislodged, they should be brought to rest in a stable location along the foothills. All dislodged rocks are planned to be left at the site. The cost of this effort has been estimated at about \$400,000 and a construction period of about three weeks.

### 3.3 SIMILAR ROCKFALL PROJECTS AND EXPERIENCED CONTRACTORS

A rockfall protection fence and roadway realignment method was used at Waimea Bay in June 2000 to protect Kamehameha Highway from potential rockfalls and at the Old Puunui Quarry site to protect residents from the upslope boulders. The special rockfall protection fence was designed and manufactured by GeoBrugg. Rockfall catchment ditch, rock demolition, bolting, and cable netting have been performed in various locations on Oahu including at Waimea Bay, at Makapuu during a major scaling and netting of the mountain slopes, and at Laie of Hawaii Kai. The recently completed Kailua Road project used a combination of rockfall impact fence, both draped and anchored mesh systems, rockfall catchment ditch, rock scaling, rock bolting, local netting, and cable lashing. The latest major scaling operation performed in Hawaii was the scaling of 130 bunkers at Waialeale. Tens of thousands of boulders, some of them over ten tons, were scaled from the slopes above the bunkers. A large number of boulders were scaled easily by hand, reflecting their high rockfall potential.

The following general contractors are among those who have been involved with rock scaling/demolition/bolting and/or rockfall fence/net/ditch installation in Hawaii:

- High Tech Rockfall Construction
- AIS Construction
- Prometheus Construction
- Royal Contracting Co. Ltd.
- Kiewit Pacific Co.
- Good Fellow Brothers, Inc.

## Appendix C

By Ron Terry, Ph.D. and Patrick Hart, Ph.D.  
Geometrician Associates, LLC  
February 2009

## 1. INTRODUCTION

This report describes the results of a biological survey of approximately 64 acres within the boundaries of Hā'ena State Park on the Island of Kaua'i (Figs. 1-2). The objectives of the survey were to provide:

- A one-time physical survey of the flora and fauna of the 64-acre Ha'ena State Park (including the portion of Limahuli Stream below Kūhio Highway) documenting all plants, birds, reptiles, amphibians, mammals, freshwater fish, and marine reptiles or mammals fauna observed on the beach strand, with a complete species list. The survey was not intended to include invertebrates or marine flora, or marine fauna other than those listed above.
- A review of previous surveys or articles related to the flora, fauna, and habitats of Ha'ena State Park and Limahuli Stream.
- A comprehensive report of survey results, observations, and findings pertaining to the areas and biota specified above, with narrative describing each major plant community, stream habitats, sensitive habitats, unusual or significant species, occurrences, and the value of the area for conservation of native biota.
- A discussion of potential effects from increased recreation activities on wildland resources including invasive species, soil erosion, native plant and animal populations, endangered species, native plant communities, and sensitive habitats.
- A GIS map of existing plant communities, significant species occurrences, and demarcated cultivated and wetland areas.

The area was surveyed on foot by biologists Ron Terry and Pat Hart on January 17-19, 2009. This survey also relies heavily on the botanical report conducted by Bishop Museum botanist Kenneth M. Nagata in 1991 as part of earlier planning efforts at Hā'ena State Park.

The project site is located on the north coast of Kaua'i in the district of Hanalei. It is bordered by Limahuli Stream on the east, the *pali* (cliff) separating Ha'ena and Hanakapi'ai on the south and the ocean on the north and west. The elevation ranges from sea level to approximately 200 feet above sea level on the *pali*. The property is mostly fairly flat, with substantial slopes restricted to the mauka side of Kūhio Highway, where talus slopes eventually give way to *pali*. The biologists walked irregular but densely spaced transects in order to get a full picture of the vegetation on the site. Although vegetation was dense, the limited size of Ha'ena State Park and numerous orientation features allowed the area to be reasonably fully covered and surveyed. Several looping excursions into the cliffs above the property were made where safety permitted. As the property boundary on the *pali* side was not known and it was not safe to survey in most areas of the cliffs, some areas

**Figure 1**  
**Project Location USGS Map**

**Figure 2**  
**Project Location Airphoto**

within the boundaries of the park were likely not surveyed. Plant species were identified in the field and, as necessary, collected and keyed out in the laboratory. Special attention was given to the possible presence of any federally (USFWS 2009) listed threatened or endangered plant species. Bird, reptile, amphibian and fish species were identified by sight and/or sound. In this report, on the first instance of the mention of a species, the common and scientific names are both given. Thereafter, only the common name is used, with occasional repetitions of the scientific name for clarity.

#### Limitations

No biological survey of areas such as this can claim to have detected every species present. Some plant species are cryptic in juvenile or even mature stages of their life cycle. Dry conditions can render almost undetectable plants that extended rainfall may later invigorate and make obvious. Thick brush can obscure even large, healthy specimens. Only a fraction of birds that might be present in an area over the course of a year will be detected during a survey because of season, time of day, or other factors. Reptiles and amphibians can also be cryptic and may not be in evidence despite a thorough survey. Marine species that make only occasional use of the site may not be present on the days of the survey. The findings of this survey must therefore be interpreted with proper caution; in particular, there is no warranty as to the absence of any particular species. Furthermore, during the time of the survey, access was not possible into the Allerton Estate heiau area, and the general descriptions provided herein are based on previous work, with no attempt to list the species that might be present there. As this area has been completely cultivated, it is unlikely that any significant native species were omitted.

## 2. FLORA AND VEGETATION

#### Vegetational Influences

The geologic substrate in this area is alluvial beach and dune sand on the flats, behind which is the *pali*, which is formed from lavas of the Napali member of the Waimea Canyon Basalt formation (MacDonald et al 1986; UH-Hilo 1998). A distinct volcanic dike is visible making a vertical scar on the *pali*, evidence that the Hā'ena area is on a rift zone of the volcano that formed the island. Elevation varies from sea level to 200 feet above sea level. Annual rainfall in this area of Kaua'i is about 40 inches, according to the *Atlas of Hawai'i*, 3<sup>rd</sup> ed.

Given the rainfall, elevation, geologic substrate, and existing vegetation, prior to human disturbance, the general area probably supported a Coastal Mesic Forest dominated by hala (*Pandanus odoratissimus*) and 'ohi'a lehua (*Metrosideros polymorpha*) (Gagne and Cuddihy 1990). Nagata (1991) believed that alaha'e (*Psydrax odorata*), papala-kepau (*Pisonia* spp.), and hau (*Hibiscus tiliaceus*) may also have been prominent components. The herb layer was likely made up of various ferns and herbs that are still present as elements of today's vegetation.

This broad vegetation type was a matrix in which local conditions produced variants. Most obvious is the strand community on the shoreline, which today is represented mostly by pohuehue (*Ipomoea pes-caprae*) and naupaka (*Scaevola taccada*). This community probably contained a wide diversity of species such as nanea (*Vigna marina*), pohinahina (*Vitex rotundifolia*), nehe (*Lipochaeta integrifolia*), akiaki grass (*Sporobolus virginicus*) and pa'u-o-Hi'iaka (*Jacquemontia ovalifolia*). Native trees such as hau, hala, milo (*Thespesia populnea*) and kou (*Cordia subcordata*) were also

probably present. This strand community was probably much wider than today and extended back into the dunes. It is also possible that marsh ecosystems dominated by sedges such as *Cyperus javanicus* and *C. polystachyos* were also present.

Centuries of disturbance by agricultural and settlement completely changed the vegetation. The forests were cleared and the natural hydrology rearranged to support terraced wet taro (*Colocasia esculenta*) agriculture, with diverse gardens of a variety of Polynesian crops including breadfruit (*Artocarpus altilis*), ti (*Cordyline fruticosa*) sugarcane (*Saccharum officinarum*), 'ohi'a ai (*Syzygium malaccense*) and many others. Useful native plants such hala and hau were allowed to flourish in appropriate environments. In the 19<sup>th</sup> century, Western crops such as mango (*Mangifera indica*), various types of citrus (*Citrus* spp.), papaya (*Carica papaya*) and guava were added to the agricultural mix.

The area now within Hā'ena State Park experienced a gradual abandonment later in the 19<sup>th</sup> and early 20<sup>th</sup> century, and parts of it were incorporated in various estates, an informal countercultural camping area, and then a State Park. Over time, some of the existing species disappeared, others simply persisted in place (e.g., breadfruit), and others became feral (e.g., guava). New, aggressive invasive species such as Java plum (*Syzygium cumini*) began to become dominant.

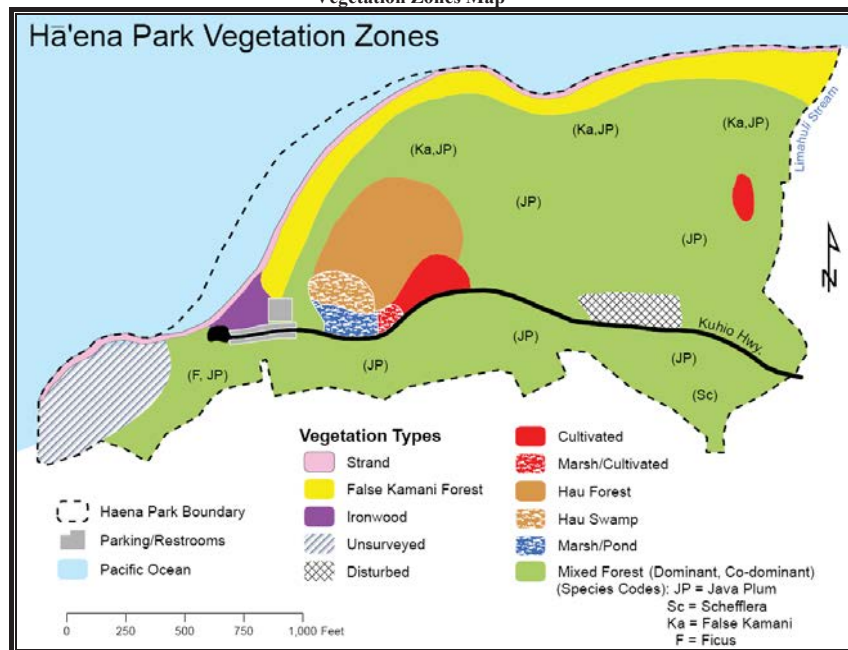

Ripperton and Hosaka described the vegetation of the general region in 1942 as shrubs and closed forest (Zone D, low phase) dominated largely by guava (*Psidium guajava*). Other characteristic species in this zone included sensitive plant (*Mimosa pudica*), Spanish clover (*Desmodium incanum*), ni'ani'au fern (*Nephrolepis exaltata hawaiiensis*) and such grasses as Hilo grass (*Paspalum conjugatum*), carpet grass (*Axonopus compressus*) and basket grass (*Oplismenus hirtellus*). 'Ohi'a lehua, most common in the upper portions of this zone, extended down to sea level in certain areas. Hala and kukui (*Aleurites moluccana*) are abundant in certain localities.

By the time of the 1991 Nagata survey, the vegetation was very similar to what it is today, with exceptions that are noted below in the section entitled "Vegetation Change." Our strong presumptions beginning the survey were that few if any rare, threatened or endangered species would be expected. Nevertheless, favorable micro-habitats such as rock outcrops and the *pali* mauka of Kūhio Highway might harbor more natives and thus merited as close an inspection as safely feasible. In general, the altered vegetation represents a degradation of habitat for native animal species, but environments such as the strand, Limahuli Stream, and the *pali* might offer good if not pristine habitat.

#### Current Vegetation

A number of basic vegetation types, all heavily influenced by human activity, are present at Hā'ena State Park (Figure 3). These vegetation types are not true "communities" because they have not co-evolved. Instead, they are haphazard collections of a few hardy natives, remnant cultivated plants, and various alien plants that are constantly in flux. Very little of the vegetation is in even temporary equilibrium, and both species composition and vegetational structure appear to be constantly changing. Figure 3 is therefore presented with the caution that it is an approximate snapshot of an area that has undergone drastic change and will continue to do so, whether or not the future brings purposeful human intervention. The map is diagrammatic and the boundaries between zones are approximate. The eleven zones are described below.

Figure 3  
Vegetation Zones Map

Source: Fieldwork by R. Terry and P. Hart, January 2009

#### Strand Zone

The strand, here defined as the zone seaward of the tree line, is poorly developed (Figures 3 and 4). When present it consists mostly of the indigenous pohuehue (*Ipomoea pes-caprae*), the possibly indigenous grass kukaipua'a (*Digitaria setigera*), and seedlings of such alien trees as ironwood (*Casuarina equisetifolia*), tree heliotrope (*Tournefortia argentea*) and false kamani (*Terminalia catappa*). Few other species are found in this community. Beach naupaka (*Scaevola taccada*), generally regarded as a typical strand species, occurs uncommonly. As discussed above, a typical healthy strand ecosystem in a climatic and geological setting such as this would be much more diverse. The density of ironwood and particularly false kamani shading out the strand from the land side and heavy wave action scouring strand vegetation away from the ocean side has depauperized the strand. The section below on management recommendations values discusses opportunities for restoration of this area.

Figure 4  
Strand Zone Vegetation

#### False Kamani Forest Zone

This zone dominates the areas a variable distance of 75 to 150 feet mauka of the strand and consists of false kamani trees 30 to 40 feet tall, with a few remnant ironwoods and the occasional emergent Java plum (Figures 3 and 5). The canopy cover is typically closed and the resulting dense shade precludes the development of any significant ground cover. The shrub and herb layers, when present, consist mostly of false kamani seedlings. According to the 1991 Nagata report, ironwood was once co-dominant here. Although the fringe of the strand exhibits a row of ironwoods, most of the old ironwood trees have died (many stumps and treefalls are present), perhaps as result of damage from Hurricane Iniki, and false kamani has taken over. The False Kamani Forest grades into a variant of the Mixed Forest zone that is dominated by Java plum and false kamani.

#### Ironwood Zone

There is only a small remnant of area outside the strand fringe that is truly dominated or co-dominated by ironwood (Figures 3 and 6). In this area the understory consists of a thick carpet of ironwood "needles" and a poorly developed shrub and herb layer of wedelia (*Wedelia trilobata*) and pothos (*Epipremnum pinnatum*). This is found near the end of the road, lifeguard stand and new restroom, and may be the result of managing the forest here. According to a posted sign at the park, this area is being restored with native species.

**Figure 5**  
**False Kamani Zone Vegetation**

**Figure 6**  
**Ironwood Zone Vegetation**

### Mixed Forest Zone

The Mixed Forest zone is the largest vegetation zone in the park. This zone consists of most of the areas classified by Nagata (1991) as either Java Plum Forest or Mixed Forest (Figures 3 and 7). In our classification, these two zones have been lumped, but the vegetation zone map (Figure 3) includes a number of point symbols indicating which species are dominant or co-dominant. These two zones have been combined because the characteristics that apparently distinguished them in 1991 do not appear today to be nearly as distinct. Areas that had once been dominated almost completely by Java plum now host a number of other species, including false kamani, hau, Chinese banyan (*Ficus microcarpa*), octopus tree (*Schefflera actinophylla*), kukui, African tulip (*Spathodea campanulata*), guava, waiawi (*Psidium cattleianum*), Christmas berry (*Schinus terebinthifolius*), cinnamon (*Cinnamomum zeylanicum*) and Madagascar olive (*Noronhia emarginata*). There are still limited areas in which Java plum is completely dominant, and the forest matches the description given by Nagata:

Typically the forest consists of Java plum trees at least 30 feet tall with 50-100% canopy cover. In some areas false kamani is co-dominant in the upper canopy and occasionally forms a secondary canopy as well. The density and composition of the understory varies considerably. In some areas the understory is open with a sparse shrub layer of Java plum saplings and a well-developed herb layer of awapuhi [note: in 2009 this species was not observed] ... laua'e...basketgrass, or pothos. In other areas the understory is dense and consists of a well-developed shrub layer of mostly Java plum saplings and guava. In certain areas the indigenous...*Nephrolepis exaltata* is the dominant species in the herb layer.

The Mixed Forest, as the name implies, is highly variable. As noted in Nagata (1991), there are many small sunny patches in which shrubs such as guava and sourbush (*Pluchea symphytifolia*) replace Java plum and other trees and the understory consists of Hilo grass (*Paspalum conjugatum*), laua'e (*Phymatosorus grossus*), honohono (*Commelina diffusa*), and Job's tears (*Coix lachryma-jobi*), among others. Two native trees, hau and hala, appear to be holding their own. Vines such as morning glory (*Ipomoea indica*) and water lemon (*Passiflora laurifolia*) are still present, but moon flower (*Ipomoea alba*), noted as present by Nagata, was not observed.

In the Mixed Forest mauka of Kūhio Highway, the soils are better drained than the flats and the landscape is covered with talus from the *pali*. Christmas berry is more abundant along the talus mauka of Kūhio Highway. The ground cover here is dominated by basketgrass, pothos, and several ferns. In shady, steep areas there are a few of the indigenous 'ala'alawainui (*Peperomia leptostachya*), and the endemic ko'oko'olau (*Bidens forbesii*) and akoko (*Chamaesyce celastroides* var. *lorifolia*) are present in sunny patches.

As detailed by Nagata (1991), the Mixed Forest (and indeed the entire park) contains numerous ornamental species that are either remnant and in decline or are invasive and spreading. Firmly established species that are remnants of old plantings include Turk's cap, solitaire palm (*Ptychosperma elegans*), small shell ginger (*Alpinia mutica*), red ginger (*A. purpurata*), shell ginger (*Zingiber zerumbet*), spiral flag (*Costus speciosus*), and five fingers (*Syngonium auritum*).

Figure 7  
Mixed Forest Zone Vegetation

#### Cultivated Areas Zone

Nagata (1991) called three portions of the project site Cultivated Areas: the Allerton Estate, including Ka Ulu a Paoa Heiau and Lohi'au's Hula Platform (the numerous no-trespassing signs and a lack of arranged access prevented us from surveying this area in 2009); a small cabin within the Mixed Forest near Limahuli Stream (which is no longer actively cultivated and which the forest is steadily overtaking); and an informal, overflow parking area along Kūhio Highway. In this survey, we reclassified the overflow parking area as Disturbed Vegetation but added the taro farming area in the center of the park (Figures 3 and 8) near the wetlands as a third cultivated area. The Cultivated Area zone is a miscellaneous category that completely lacks any vegetation community characteristics. A large number of species are present. Although not surveyed by us in 2009, Nagata found the Allerton Estate to have a great number of ornamental and food species, many of which are presumably still present. Nagata described the vegetation here thus:

The Allerton Estate, Ka Ulu a Paoa Heiau and Lohi'au's Hula Platform... contain the majority of the species. The lawns consist of a mixture of Nib grass, goosegrass (*Eleusine indica*), kyllinga (*Cyperus kyllinga*), Asiatic pennywort (*Centella asiatica*), synedrella (*Synedrella nodiflora*) and *Hemigraphis repens*. Among the numerous ornamentals are hybrid roses (*Rosa* x), colored ti (*Cordyline* x), allamanda (*Allamanda cathartica*), crape myrtle (*Lagerstroemia indica*) and oleander (*Nerium oleander*). Several such as pothos, taro vine, mango, king palm (*Archontophoenix alexandrae*) and tithonia (*Tithonia diversifolia*) have become naturalized and are spreading into the adjacent Mixed Forest.

As in the Nagata survey, a number of food plants and ornamentals are still found around the cabin near Limahuli Stream. Notable are *Citrus* spp., Otaheiti apple or vi (*Spondias dulcis*), coconuts (*Cocos nucifera*), small shell ginger, spiral flag, hybrid roses, common heliconia (*Heliconia humilis*), and banana (*Musa x paradisiaca*).

In addition to taro, the taro farming area includes in its vegetation a number of weeds typical of farms, similar to those listed below for the overflow parking area. Towards the pond end of the cultivated area, plants tolerant of saturated soils such as honohono and Job's tear's begin to predominate.

#### Disturbed Vegetation Zone

Nagata's "cultivated" area near Kūhio Highway continues to be used as an overflow parking area. Here, a large variety of weeds are present, including goosegrass (*Eleusine indica*), wedelia, finger grass (*Chloris* spp.), partridge pea (*Chamaecrista nictitans*), *Desmodium* spp., sensitive plant, Jamaican vervain (*Stachytarpheta jamaicensis*), and plantain (*Plantago* spp.). Koa haole (*Leucaena leucocephala*) and Guinea grass (*Panicum maximum*) are common at the periphery.

Figure 8  
Cultivated Area Zone Vegetation

Figure 9  
View of Pond, Marsh and Swamp

#### Marsh/Pond and Marsh/Cultivated Zones

One area classified by Nagata (1991) as "Grassland" appears to have changed markedly. The area roughly delineated in his 1991 map is now occupied by a combination of small areas that we have designated Cultivated Area (the taro farm discussed above), Marshland/Pond, and a transitional vegetation type called Marshland/Cultivated. In 1991, according to Nagata:

The Grassland occupies a series of low-lying taro terraces which is irrigated by a single auwai and although the substrate was dry during the time of the survey it probably becomes rather marshy during the wet season.

There were no permanent areas of standing water noted in the 1991 report. In January of 2009, after a month of heavy rains, a pond and marshy wetlands occupying perhaps an acre were apparent (Figures 3 and 9). Native Koloa or Hawaiian Ducks (*Anas wyvilliana*) were utilizing the ponds daily, and the singing of bullfrogs (*Rana catesbeiana*) was evident. Fringing the ponds were wetlands marshes, which extended back east towards the cultivated area. Several soil pits dug during the survey revealed the presence of mucky, sulfidic soils indicating frequent saturation and reducing conditions, meaning that the inundated condition is not unusual. The eastern edge of the marsh can be, and probably is at times, cultivated for taro, and is thus distinguished as its own, transitional Marsh/Cultivated Zone, grading into the taro farm in the Cultivated Area. Additional investigation is required to delineate the boundaries of the wetlands per definitions of Section 404 of the Clean Water Act (U.S. Department of the Army 1987), but the soil, hydrological, and vegetation indicators all appear to be present at least in the core area around the pond.

Species present in the marshy area included Job's tears, honohono, 'ape (*Alocasia macrorrhiza*), Hilo grass (*Paspalum conjugatum*) and California grass (*Urochloa mutica*), among others.

#### Hau Swamp and Hau Forest Zones

The marsh wetlands are bordered on the shoreline side by the Hau Swamp zone (Figures 3 and 9). This closed canopy, low-lying area is almost 100 percent tangled hau branches. Further investigation of inundation and soil conditions would be required to determine if this zone qualifies as a jurisdictional wetlands under Section 404 of the Clean Water Act and to delineate the wetlands boundaries, but initial indications are that it should be so classified. As the terrain steps up in elevation slightly, the Hau Swamp grades into the Hau Forest and Mixed Forest zones.

#### Other Areas

Not classified within their own zones are the *pali* (the extent to which the *pali* lies within the park was not known during our survey) and miscellaneous areas such as the restroom, roadsides and parking areas. The vegetation of the latter types is typical of the weeds found in the Cultivated and Disturbed zones. A portion of the park appears to include the *pali*. One ascent of the *pali* near the former Lohiau's House was made, but it was mostly surveyed with binoculars during a number of excursions to the base and from the road. Similar to Nagata's 1991 observations, the vegetation along the cliff face consist mostly of scrub ironwood, Java plum, Christmas berry, waiawi, octopus tree, with a shrub and herb layer of Jamaican vervain, Pluchea, air plant (*Kalanchoe pinnata*), and scarlet orchid (*Epidendrum x obrienianum*). This area included the highest density of native plants, including ahinahina, ko'oko'olau, akoko, 'ala'alawainui, moa, 'ohi'a lehua, and the sedge *Carex meyenii*.

## Flora

Appendix 1 contains a full list of plant species found at the park, which is not included in the main body of this report because of its length. We recorded a total of 117 flowering plants and 9 ferns or fern allies. Most of the plant species found were alien; 15 were indigenous and six were Hawai'i endemics. The remaining plants are alien, including several species considered invasive. No listed or proposed threatened or endangered plant species (USFWS 2009) were found.

The Nagata survey, which accessed the Allerton Estate and probably recorded there a number of alien species not found anywhere in our 2009 survey, found a total of 218 flowering plants and 9 ferns or fern allies.

### Significant Species

#### Native Species

As was true when Nagata surveyed the park in 1991, native species are of minor importance in the floristic composition. They comprise approximately 17 percent of the total number of species but account for very little of the total cover and are not abundant except in restricted areas near the cliff, on the strand, and in the hau forest and swamp. None are classified as threatened or endangered or considered rare. Most are common throughout the major Hawaiian Islands. Two of the six endemics are restricted to Kaua'i: *Bidens forbesii* is a common lowland species on the north shore and *Artemisia kauaiensis* is found throughout the sea cliffs of Kaua'i.

Most of the native species are widely scattered in small numbers. Of the 15 native species, only Koali (morning glory) and the ni'ani'au fern are widely common, with hala and hau scattered but locally abundant. Pohuehue is considered abundant in the Strand zone. Except in the *pali* area, all of the endemic species are uncommon in the park.

#### Species of Cultural Significance

Ten species of early Polynesian introduction are found in the surveyed area: mountain apple, sugar cane, banana, noni, ti, coconut, breadfruit, 'ape, taro, and kukui. Of these, all but breadfruit, which is only sparingly naturalized but persists after cultivation, have spread in various vegetation types throughout Hawai'i. Although all are culturally significant, their distribution in the project site cannot easily be correlated with historical Hawaiian land uses in the park, as Nagata pointed out in 1991. Most of the species are found in small numbers in the Mixed Forest both within and outside the system of taro lo'i. Many of the plants are growing inside the terraces indicating naturalization after the abandonment of the terraces. Nagata found that ti was the only Polynesian alien species recorded from Ka Ulu a Paoa Heiau and Lohi'aus Hula Platform. The planting of ti in sites of such religious and cultural significance can be considered traditional but it was not known whether they resulted from ancient, or more modern, plantings. Several large specimens of kukui and breadfruit are present in the site, indicating rather old plantings. In general, the distributions of these Polynesian plants do not appear to be useful in interpretation of traditional land use.

## Invasive Species

The Hawai'i-Pacific Weed Risk Assessment (HP-WRA) is a research project by scientists from the University of Hawai'i and the USDA Forest Service to identify plants that pose a high weed risk in Hawai'i and other Pacific Islands. ([http://www.botany.hawaii.edu/faculty/daehler/wra/full\\_table.asp](http://www.botany.hawaii.edu/faculty/daehler/wra/full_table.asp)). The HP-WRA score is a prediction on how invasive a species will become, and does not attempt to balance the costs and benefits of introduced species in terms of potential economic, ecological, public health, medicinal, historic, community, cultural, tourism, and esthetic values. The HP-WRA ratings have no regulatory authority and the HP-WRA list is not an official State list of invasive plants.

In the status column of Appendix 1, species listed as posing a high weed risk are identified, either as species likely to be invasive (INV, which included 7 species) or already determined to be invasive (INV-H, which included 6 species) based on published information on the species' current impacts in Hawai'i. The species already determined to be invasive are strawberry guava (*Psidium cattleianum*), guava (*Psidium guajava*), octopus tree (*Schefflera actinophylla*), Christmas berry (*Schinus terebinthifolius*), Guinea grass (*Panicum maximum*), and Hilo grass (*Paspalum conjugatum*). Although not listed among the 13 species, Java plum (*Syzygium cumini*) should probably be considered highly invasive, and based on its rapid initial inroads into the forest in no more than 17 years, the Madagascar olive (*Noronhia emarginata*), which is currently on the HP-WRA list as a species to evaluate, may soon merit classification as invasive in Hawai'i. With the exception of Madagascar olive (which we observed scattered in other locations along the North Shore of Kaua'i), the other invasive plants are long established. We did not observe any indication that they are notably expanding their range or densities or pose a threat to adjacent, unfested areas.

### Vegetational Change

The vegetation of Hā'ena State Park has been undergoing disturbance and transformation since human settlement over a millennium ago. As Nagata pointed out in 1991, major alteration began with the construction of the terrace system. Some areas may have been left intact but eventually the native forests were probably transformed utterly by centuries of use. Human use since the early 19<sup>th</sup> century has also been periodically intensive, as evidenced by ornamental species, ruins of structures, and trash piles. In the end, no original plant communities of the type discussed at the beginning of the report remain.

Even in the short interval between the last vegetation survey in 1991 and the current one in 2009, vegetation change has been occurring. A subtle change has been the convergence of the Java Plum and Mixed Forest into a diverse, if alien-dominated, Mixed Forest. It is likely that the relatively importance of various species in terms of abundance and cover has changed, but this is difficult to characterize. An obvious change is the appearance of *Noronhia emarginata* or Madagascar olive, which was not present in the 1991 survey and is now a prominent component, at least in terms of abundance. The large number of juveniles trees of this species portend that it will be a major component of the forest in the near future. The most striking change was the decline of ironwood in the area mauka of the shoreline, where it was recently described as co-dominant. As observed earlier in this report, many, if not most, of the old ironwood trees have died, perhaps as result of damage from Hurricane Iniki, and false kamani has taken over. Perhaps because of the increasing shade from the kamani trees (along with heavy wave action), the strand vegetation, described by Nagata as already sparse, appears to have declined in size and diversity even further.

### 3. FAUNA

#### Birds

Thirteen species of birds were detected during the survey (Table 1), including the federally endangered Hawaiian Duck (Koloa Maoli; *Anas wyvilliana*), two indigenous shorebirds (Kolea; *Pluvialis fulva* and ‘Ulili; *Heteroscelus incanus*), and an indigenous seabird (Koa’e Kea; *Phaethon lepturus dorotheae*). All other birds were non-native introductions. Japanese White-eyes (*Zosterops japonicus*) were particularly abundant in the mixed forest, as were White-rumped Shammas (*Copsychus malabaricus*) and Red Jungle Fowl (*Gallus gallus*). No native land birds were observed on the project site, nor would they be expected to be found in the area due to the low elevation, lack of native forest habitat and the abundance of disease-carrying mosquitoes. A large number of native species, some endangered, are known from areas mauka, and it is possible that occasional sightings of native forest birds are made at the park. Many species of shorebirds, waterbirds, and seabirds, some of which are federally listed endangered species, might be expected to make occasional use of the project site.

In addition to the Pacific Golden Plovers and Wandering Tattlers that were observed, other shorebirds that likely make occasional use of the project site but were not seen during the surveys include the Ruddy Turnstone (*Arenaria interpres*), Bristle-thighed Curlew (*Numenius tahitiensis*), Sanderling (*Calidris alba*), and various other Sandpipers. The Black-crowned Night-heron (‘Auku‘u; *Nycticorax nycticorax hoactli*), an indigenous wetland bird, would also be expected to make use of the area. Other native water birds that may make use of the wetland areas include the federally endangered Black-necked Stilt (Ae‘o; *Himantopus mexicanus knudseni*), the federally endangered Hawaiian Coot (‘Alae ke‘oke‘o; *Fulica alae*), the federally endangered Hawaiian Moorhen (‘Alae ‘ula; *Gallinula chloropus sandvicensis*) and the federally endangered Nene (*Branta sandvicensis*).

Many species of seabirds would be expected to make use of the airspace over the park. Species that were not seen in our limited surveys include Noddies (*Anous sp.*), Terns (*Sterna sp.*), Frigate Birds (‘Iwa; *Fregata minor palmerstoni*), Shearwaters (*Puffinus sp.*), Albatross (*Phoebastria sp.*), Boobies (*Sula sp.*), Petrels (*Pterodroma sp.*) and Red-tailed Tropicbirds (*Phaethon rubricauda melanorhynchos*). Most notably, three species of rare seabirds undoubtedly fly over the park on their way to nests in mountains of Kaua‘i: the federally endangered Hawaiian Petrel (‘Ua‘u; *Pterodroma phaeopygia sandwichensis*), the federally threatened Newell’s Shearwater (‘A‘o; *Puffinus auricularis newelli*), and the Band-rumped Storm-Petrel (*Oceanodroma castro*), which is listed as endangered by the State of Hawai‘i. Radar surveys indicate that the north shore of Kaua‘i has large populations of these latter three species (N. Holmes *per. comm.*).

Although these threatened and endangered seabirds are not likely to utilize the park’s resources for feeding, resting or nesting, developments that involve structures or lighting can affect these birds. The principal potential impact is the increased threat that birds will be downed after becoming disoriented by exterior lighting, if this is provided at the park.

**Table 1**  
**Bird Species Identified On/Near Ha‘ena State Park**

| Scientific Name                    | Common Name             | Status             |
|------------------------------------|-------------------------|--------------------|
| <i>Acridotheres tristis</i>        | Common Myna             | Alien Resident     |
| <i>Copsychus malabaricus</i>       | White-rumped shama      | Alien Resident     |
| <i>Pluvialis fulva</i>             | Pacific Golden-Plover   | Indigenous Visitor |
| <i>Cardinalis cardinalis</i>       | Northern Cardinal       | Alien Resident     |
| <i>Paroaria coronata</i>           | Red Crested Cardinal    | Alien Resident     |
| <i>Streptopelia chinensis</i>      | Spotted Dove            | Alien Resident     |
| <i>Phaethon lepturus dorotheae</i> | White tailed Tropicbird | Indigenous         |
| <i>Heteroscelus incanus</i>        | Wandering Tattler       | Indigenous Visitor |
| <i>Gallus gallus</i>               | Red Junglefowl          | Alien Resident     |
| <i>Anas wyvilliana</i>             | Koloa                   | Endemic            |
| <i>Geopelia striata</i>            | Zebra Dove              | Alien Resident     |
| <i>Carpodacus mexicanus</i>        | House Finch             | Alien Resident     |
| <i>Zosterops japonicus</i>         | Japanese White-Eye      | Alien Resident     |

#### Mammals, Reptiles and Amphibians

Aside from feral cats (*Felis catus*), no wild mammal species were detected during the course of this survey. It is highly likely that mice (*Mus spp.*) and rats (*Rattus spp.*) are present. The biologists encountered various pet domestic dogs (*Canis f. familiaris*) but no indication that wild dogs are present in the area. Although the biologists did not see wild pigs (*Sus s. scrofa*) or goats (*Capra h. hircus*), they are known to be present in this part of Kaua‘i. None of these alien mammals have conservation value and all are deleterious to native flora and fauna.

As with all of Kaua‘i, Hā‘ena State Park may also be used by the State’s only endemic mammal, the Hawaiian Hoary Bat (*Lasiurus cinereus semotus*), which is listed as an endangered species. Hawaiian hoary bats are cryptic and little is known of their habits or habitat in Kaua‘i, but they often seen in the Hanalei area. They can be regularly observed foraging on insects attracted by the lights of a gas station on the highway in Princeville (R. David, 2008, pers. comm. to R. Terry).

Endangered Hawaiian monk seals (*Monachus schauinslandi*) primarily inhabit the remote Northwestern Hawaiian Islands, which because of the relative lack of disturbance are excellent habitat for the seals to swim and dive for fish, spiny lobsters, octopuses, and eels. Monk seals spend most of their time in the ocean, but come ashore to rest on beaches and even utilize fringe vegetation as shelter from storms. They are increasingly being seen in the main Hawaiian Islands, and are frequently observed (and have been observed by our team at different times) at Hā‘ena State Park. Monk seals can become agitated and sometimes aggressive if people approach too closely or are too loud. Disturbing them may also interrupt resting periods and may even cause a mother seals to abandon their pups. Feeding monk seals may adversely change their natural foraging instincts. Hawaiian monk seals are also susceptible to diseases spread by the feral mammals sometimes present in parks, such as leptospirosis (transmitted mainly through feral mammal urine in water) and toxoplasmosis (associated with feral cats).

Table 2

**Mammal, Reptile and Amphibian Species Identified in/Near Ha'ena State Park**

| Scientific Name                                        | Common Name        | Status |

| All species in January 2009 survey                     |                    |        |
| <i>Rana catesbeiana</i>                                | Bullfrog           | A      |
| UnID'd (Family: <i>Scincidae</i> )                     | Skink              | A      |
| <i>Anolis carolinensis</i>                             | Green Anole        | A      |
| UnID'd (Family: <i>Gekkonidae</i> )                    | Gecko              | A      |
| <i>Felis catus</i>                                     | Cat                | A      |
| Native species detected in previous documented surveys |                    |        |
| <i>Lasiurus cinereus semotus</i>                       | Hawaiian Hoary Bat | E, End |
| <i>Monachus schauinslandi</i>                          | Hawaiian Monk Seal | I, End |
| <i>Chelonia mydas</i>                                  | Green Sea Turtle   | I, Th  |
| <i>Eretmochelys imbricata</i> *                        | Hawksbill Turtle   | I, End |

Notes: Alien (A), Indigenous (I), Endemic (I), Endangered (End), Threatened (Th); \* not confirmed

Three species of reptile, a skink not identified to the species level, a green anole (*Anolis carolinensis*), and a gecko not identified to the species level, as well as one species of amphibian, the bullfrog (*Rana catesbeiana*), were detected during the survey. These species are all common on Kaua'i. There are undoubtedly other species of lizard and frog present in or near the park. The infamously noisy coqui frog (*Eleutherodactylus coqui*) is not yet present on Kaua'i.

*Limahuli Stream Fishes*

A number of stream surveys have been conducted for Limahuli Stream in its lower, middle and upper reaches. The Hawai'i Stream Research Center (UH-HSRC) was established in 1996 through a partnership between Limahuli Garden (The National Tropical Botanical Garden) and the Hawai'i Division of Aquatic Resources (DAR) to develop and implement a Long Term Ecological Research (LTER) Program monitoring biological structure and function in Limahuli Stream at the ahupua'a-watershed scale. An unpublished report from 2001 by Mike Kido of DAR supplied as part of background material for this survey discussed the findings to date on Limahuli Stream. It appears to be a continuous, perennial system, with an average flow from 1994 to 1999 measured at 6.3 million gallons per day, stabilized by substantial groundwater flow at times when drought limits surface runoff. It drops from an elevation of about 2,000 feet over a distance of less than four miles. The riparian zones adjacent to Limahuli Stream are dominated by invasive tree species that provide heavy shade and contribute substantial organic material in the form of plant litter, which flows to ocean during floods. Ha'ena State Park includes only the very lowest 1,000-foot stretch of Limahuli Stream. This portion is critical, however, because it provides the connection between the stream and the ocean for a number of fish species that are diadromous, meaning they must spend part of their life cycle in the sea and part in a stream.

Five species of endemic and indigenous Hawaiian gobies (o'opu) may inhabit this stream, including the o'opu alamo (*Lentipes concolor*), o'opu nopili (*Sicyopterus stimpsoni*), o'opu naniha (*Stenogobius hawaiiensis*), o'opu akupa (*Eleotris sandwicensis*) and o'opu nakea (*Awaous guamensis*). These o'opu live their adult lives and lay their eggs in the streams, but upon hatching, the larvae drift out to sea where they develop as plankton for a number of months before returning to fresh water. The alamo'o, nopili, and nakea may be found furthest up Limahuli Stream because their sucker-like pectoral fins allow them to climb waterfalls, whereas naniha and akupa lack this ability and would only inhabit the sections of the stream nearest the ocean.

According to the Kido report referenced above, several years of population monitoring studies showed

...a relatively fixed species distribution pattern over time along the "mauka to makai" stream continuum despite variation in species population densities and ranges of species overlap. This is the first documented evidence for a stable population distribution pattern for native fish and invertebrates along the continuum of a Hawaiian stream. Native 'o'opu populations in Limahuli Stream are relatively robust overall; however, densities of the herbivorous 'o'opu-nopili (*Sicyopterus stimpsoni*) are significantly lower than that in neighboring Hanakapiai Stream at similar elevations. A plausible cause is the light limitation induced by the aggressive alien riparian canopy which lowers primary production levels and regulates algal diversity.

According to Kido, although a number of alien invertebrates are present in Limahuli Stream, alien fish species had been limited, at least until 2001, to periodic invasions near the stream mouth by the alien poeciliid fishes swordtails (*Xiphophorus helleri*) and guppies (*Poecilia reticulata*). The source of these intrusions are poeciliid populations in the *auwai* system that withdraws water from Limahuli Stream just mauka of Kūhio Highway and empties into the stream near its mouth after passing through old taro lands. Poeciliids were also found to in the ponds and marshes near the cultivated areas. As these poeciliid fishes are known vectors of pathogenic parasites that infect native 'o'opu species, DAR has researched chemical control.

For the current inventory, our limited survey of Limahuli Stream below Kūhio Highway over the course of two hours on January 18 identified only one species of juvenile fish, which appeared to be aholehole (*Kuhlia sandwicensis*)<sup>1</sup>. No o'opu were apparent. During January, alamo'o and nopili hatchlings, which have hatched far upstream and traveled downstream as larvae, are developing within the ocean, in preparation for swimming upstream during February to May. Nakea breed in areas just above the stream mouth from August to November and may create swarms, but by January the hatchlings are also in the ocean. It is therefore unsurprising that these three species of o'opu were not observed. As discussed above, naniha and akupa cannot climb waterfalls and might be more likely to be found near the mouth of Limahuli Stream year-round (Yamamoto and Tagawa 2000).

<sup>1</sup> The number of aholehole species in Hawai'i and their proper names are currently the subject of discussion. This report will utilize the traditional common and scientific names, and because only fry were observed, does not attempt to determine the precise species. See Randall, J.E. and Randall, H.A., 2001. "Review of the Fishes of the Genus *Kuhlia* (Perciformes: Kuhlidae) of the Central Pacific." *Pacific Science* 55(3) [http://www.hawaiifishes.com/fish\\_of\\_month/past\\_fom/fom\\_05\\_05.htm](http://www.hawaiifishes.com/fish_of_month/past_fom/fom_05_05.htm) for discussion and

**Table 3**  
**Fish Species Identified in Limahuli Stream**

| Scientific Name                 | Common Name  | Status |
|---------------------------------|--------------|--------|
| IN January 2009 Survey          |              |        |

#### 4. MANAGEMENT RECOMMENDATIONS

##### *Sensitive Resources and Areas*

As discussed above, no listed or proposed threatened or endangered plant species (USFWS 2009) were found at Hā'ena State Park, and none are likely to be found. Several endangered seabird species fly over the park on their way to nesting sites in the mountains. The endangered Hawaiian hoary bat probably utilizes the area for foraging and may roost in trees or large shrubs.

Other than perhaps portions of the cliff, which while not dominated by native species, contain a diverse assemblage of natives, no areas of botanically significant vegetation are present at the park. As Nagata (1991) noted, although some native species are present, they are widely scattered and do not present ecologically meaningful patterns. Because of the relatively scarcity of native plants, the habitat value for native animals is not significant. The vegetation does perform other ecological functions, such as helping to absorb rainfall and thus avoid erosion and sedimentation, as well as retarding the rate of coastal erosion. This report does not evaluate the cultural significance of the vegetation, but it is important to note the general persistence of at least some of the culturally important native or Polynesian-introduced plants, despite being largely overwhelmed by invasive alien species. Limahuli Stream is an important resource for the conservation of native fishes (and other organisms) and merits protection.

##### *Effects of Recreation Activities on Biological Resources*

As Hā'ena State Park develops and visitor use grows there will be more pressure on its reef, shoreline, stream and botanical resources. In general, because the biological value of most of property aside from the shoreline and Limahuli Stream is modest, such threats are limited. However, the stream and the shoreline will continue to require protection, and if parts of the park are restored, the areas needing protection will expand.

Another impact faced by all parks is that they act as concentrated points for dropping off unwanted pet animals and releasing pests such as rats, coqui frogs, and non-native plant species. The public nature of parks and their general lack of security may make members of the public less reluctant to engage in these inappropriate activities deliberately and also make it likely that occasional accidental acts may occur. Hā'ena State Park is the gateway to the Na Pali trail and Kalalau Valley, and a large proportion of its visitors come from North America, Europe, Asia and Australia. Their hiking boots and camping gear may contain seeds, spores, and even live alien organisms.

##### *Potential Restoration Opportunities*

Although the current vegetation may not currently have great conservation value, there is potential to improve the species structure of the vegetation by removing aliens and planting native species, at least in selected environments. While some of the alien species detected in the survey are invasive at least to some degree, none are currently restricted to Hā'ena State Park and thus pose a risk of spreading regionally outward from the park. Therefore, the considerations related to removing invasives center on its utility towards restoring native vegetation and the cost and difficulty of maintenance.

Probably the most important opportunity is in the coastal areas occupied by the Strand, Ironwood and False Kamani Forest zones. According to research by PBR Hawaii Inc., historical photos indicate that the false kamani trees invaded since the tsunami of 1946 and 1960, prior to which the entire area was open coastal dunes. Restoration of a native dune ecosystem consisting of plants such as pohuehue, naupaka, nanea, pohinahina, nehe, pa'u-o-Hi'iaka, akiaki grass, milo, hala and kou, would provide an improved and more authentic vegetation. Nagata (1991) pointed out that ironwood and false kamani have been widely used for erosion control and are currently performing this function at least to some degree, and seem well-suited for the task. However, native species are also adapted to coastal environments and such an effort, if carefully conducted, would likely not increase and might in fact reduce coastal erosion. Restoration of these dunes would also improve habitat for common native shorebirds, including Kolea, 'Ulili, Ruddy Turnstone, Bristle-thighed Curlew, Sanderling, and Sandpiper.

Another area with potential for beneficial impact is restoration of the riparian areas around Limahuli Stream. A large proportion of the lands below 2,000 feet in elevation in Hawai'i is agricultural. Where streams flow through these areas, the surrounding riparian forest is becoming highly invaded by a number of alien tree species, particularly rose-apple (*Syzygium jambos*), waiawi, and to a lesser degree, Java plum (*Syzygium cumuni*), as at Hā'ena State Park. These trees are especially problematic in lowland riparian areas where they form a dense, closed canopy forest that effectively prevents sunlight from reaching the ground (Smith 1985). The deep shade produced by these trees likely prevents the establishment of a mid-canopy and ground cover layer in the forest. Because of this, much of the land beneath these forests consists of bare soil that erodes easily and likely produces large amounts of sedimentation into streams during rains. Dense shade may also prevent the growth and establishment of native riparian plant species. In streams, reduced sunlight limits the growth of benthic algae (Larned and Santos 2000), which are a major food source for many rare and federally endangered native fish (Fitzsimons et al. 2003) and invertebrates (Brasher 1997). A reduction in this important food source, coupled with increased sediment loading, could ultimately result in decreased habitat quality of streams.

Less critical but perhaps still of interest in the long run would be a program to restore selected areas of the talus slopes and cliff faces. As discussed above, these areas already offer the most pristine

native habitat and diversity of native species. The difficulty and hazard of working or visiting this environment, however, may dictate against a project such as this being implemented.

The restoration of threatened and endangered (T&E) plants species provides the opportunity to not only assist directly in native plant conservation but also to educate the public. State and private landowners may utilize T&E species as long as they obtain these plants from licensed nurseries and keep records that demonstrate this.

Restoring habitat that encourages repopulation by endangered *animal* species is another matter. It brings with it the responsibility to protect these animals once they are established. In order to provide for maximum compliance with State and federal endangered species laws, the State must enter into a “Safe Harbor Agreement” prior to undertaking the habitat improvement. This is a voluntary arrangement between the U.S. Fish and Wildlife Service and a cooperating non-federal landowner under the authority of Section 10(a)(1) of the Endangered Species Act of 1973, 16 U.S.C. 1536(b)(4), 1539(a)(1). Under the Safe Harbor Agreement and an associated enhancement of survival permit, the non-federal property owner implements actions that will result in a net conservation benefit for species listed under the Act without the risk of further restrictions pursuant to section 9 of the Act, which prohibits take of listed species. The property owner also receives assurances related to modifications of the SHA or termination of the permit. Such agreements allow a landowner to promote threatened and endangered species on their property without liability for incidental takes that may occur. It might be possible to restore the small wetlands on the property with the purpose of creating native bird habitat that encourages native endangered waterbirds such as Nene, Koloa (which already utilize the pond), or Black-necked Stilts. However, the wetlands area is so small that it would be of limited value. Furthermore it is located directly adjacent to the road, where endangered birds might be harassed, injured or killed directly or indirectly by people or their pets. For both practical and legal reasons, we advise against modifying this small wetlands to attract endangered birds.

Landscape design including plantings, signage and trails can be designed to not only access, beautify, and interpret places within the park, but also to protect certain environments. If the park undertakes restoration of the strand, convenient trails should be established to direct foot traffic along paths that minimize trampling of vegetation. Signage can educate visitors and help protect plants. Limahuli Stream should be protected from use as a trash can or toilet through signage. If restored, the wetlands should be protected through fringing vegetation that encourages viewing but discourages direct entry. Although it is unlikely that many visitors will clamber up the steep, slippery and vegetation-tangled talus areas to access the cliffs (aside from the established trail accessing the Wai-a-ka-pala'e Wet Cave and the Rock Shelter features), any new trails in this area should consider both visitor hazard and native plant preservation.

#### *Specific Management Recommendations*

The following management measures are recommended to minimize impacts to biological resources:

- Park planning, particularly the location of trails and destinations, warning signage, and security personnel training and duties, must take into account balancing recreation and ecosystem protection.
- Signage and other educational material should be developed and distributed to advise the visiting public about the value of native species and not to drop off pests or unwanted pets.
- Park personnel, DLNR experts, and volunteers should monitor the park periodically for invasive species.

- Landscaping should avoid invasive species, as well as employ native species to the greatest degree consistent with project goals. Given the alien character of the vegetation and the presence of many invasive species, landscaping with natives could substantially improve on the existing botanical environment and bird habitat.
- When restoring with threatened and endangered plant species, ensure that all plant material is obtained from licensed nurseries and that records are kept to demonstrate this.
- Landscape design including plantings, signage and trails should be designed to protect the strand, stream and wetlands environments.
- In order to prevent impacts to Hawaiian hoary bats, State Parks should restrict any cutting of large shrubs or trees to periods outside the April to August pupping period for Hawaiian hoary bats.
- To reduce the potential for interactions between nocturnally flying threatened or endangered seabirds, any external lighting planned to be used during construction or within the completed project must be shielded so that light shines only downward.
- The park should continue cooperation with federal, State of Hawai'i, and non-profit organizations that help protect Hawaiian monk seals from natural and human threats.
- The park should continue to cooperate with the Division of Aquatic Resources to keep new alien fish out of *auwai* and stream and in ridding stream of periodic invasions of swordtails, guppies, and other alien fish.

**Plant Species Identified in/Near Ha'ena State Park**

| Scientific Name                         | Family           | Common Name            | Life Form | Status*  |
|-----------------------------------------|------------------|------------------------|-----------|----------|
| <i>Digitaria setigera</i>               | Poaceae          | Kukaipua'a             | Grass     | I?       |
| <i>Doryopteris decipiens</i>            | Pteridaceae      | Kumuniu                | Fern      | E        |
| <i>Elephantopus mollis</i>              | Asteraceae       | Elephant's foot        | Shrub     | A        |
| <i>Eleusine indica</i>                  | Poaceae          | Wire grass             | Grass     | A        |
| <i>Emilia fosbergii</i>                 | Asteraceae       | Pualele                | Herb      | A        |
| <i>Epidendrum x obrienianum</i>         | Orchidaceae      | Scarlet orchid         | Herb      | A        |
| <i>Epipremnum pinnatum</i>              | Araceae          | Pothos                 | Vine      | A        |
| <i>Ficus microcarpa</i>                 | Moraceae         | Chinese banyan         | Tree      | A        |
| <i>Gladiolus x hortulanus</i>           | Iridaceae        | Gladiolus              | Herb      | A        |
| <i>Heliconia humilis</i>                | Musaceae         | Common heliconia       | Shrub     | A        |
| <i>Hibiscus</i> 'sp.'                   | Malvaceae        | Hibiscus               | Shrub     | A        |
| <i>Hibiscus tiliaceus</i>               | Malvaceae        | Hau                    | Tree      | I        |
| <i>Ipomoea indica</i>                   | Convolvulaceae   | Koali                  | Vine      | I        |
| <i>Ipomoea pes-caprae</i>               | Convolvulaceae   | Pohuehue               | Vine      | I        |
| <i>Ipomoea triloba</i>                  | Convolvulaceae   | Little bell            | Vine      | A        |
| <i>Kalanchoe pinnata</i>                | Crassulaceae     | Air plant              | Shrub     | A        |
| <i>Lepisorus thunbergianus</i>          | Polypodiaceae    | pakahakaha             | Fern      | I        |
| <i>Leucaena leucocephala</i>            | Fabaceae         | Koa haole              | Tree      | A        |
| <i>Livistona chinensis</i>              | Arecaceae        | Chinese fan palm       | Tree      | A        |
| <i>Macadamia ternifolia</i>             | Proteaceae       | Macadamia              | Tree      | A        |
| <i>Macroptilium lathyroides</i>         | Fabaceae         | Cowpea                 | Vine      | A        |
| <i>Malvaviscus penduliflorus</i>        | Malvaceae        | Turk's cap             | Shrub     | A        |
| <i>Mangifera indica</i>                 | Anacardiaceae    | Mango                  | Tree      | A        |
| <i>Melinis minutiflora</i>              | Poaceae          | Molasses grass         | Grass     | A        |
| <i>Metrosideros polymorpha</i>          | Myrtaceae        | 'Ohi'a lehua           | Tree      | E        |
| <i>Mimosa pudica</i>                    | Fabaceae         | Sensitive plant        | Herb      | A        |
| <i>Morinda citrifolia</i>               | Rubiaceae        | Noni                   | Tree      | P, INV   |
| <i>Musa x paradisiaca</i>               | Musaceae         | Banana                 | Shrub     | P        |
| <i>Nephrolepis exaltata hawaiiensis</i> | Nephrolepidaceae | Ni'ani'au              | Fern      | E        |
| <i>Noronhia emarginata</i>              | Oleaceae         | Madagascar olive       | Tree      | A        |
| <i>Oplismenus hirtellus</i>             | Poaceae          | Basket grass           | Grass     | A        |
| <i>Pandanus tectorius</i>               | Pandanaceae      | Hala                   | Tree      | I        |
| <i>Panicum maximum</i>                  | Poaceae          | Guinea grass           | Herb      | A, INV-H |
| <i>Paspalum conjugatum</i>              | Poaceae          | Hilo grass             | Grass     | A, INV-H |
| <i>Paspalum vaginatum</i>               | Poaceae          | Seashore paspalum      | Grass     | A, INV   |
| <i>Passiflora edulis</i>                | Passifloraceae   | Lilikoi                | Vine      | A        |
| <i>Passiflora laurifolia</i>            | Passifloraceae   | Yellow water lemon     | Vine      | A        |
| <i>Peperomia leptostachya</i>           | Piperaceae       | 'Ala'alawainui         | Herb      | I        |
| <i>Persea americana</i>                 | Lauraceae        | Avocado                | Tree      | A        |
| <i>Phlebodium aureum</i>                | Polypodiaceae    | Rabbit's foot fern     | Fern      | A        |
| <i>Phymatosorus grossus</i>             | Polypodiaceae    | Laua'e                 | Fern      | A        |
| <i>Plantago lanceolata</i>              | Plantaginaceae   | Narrow leaved plantain | Herb      | A        |
| <i>Plantago major</i>                   | Plantaginaceae   | Common plantain        | Herb      | A        |
| <i>Plectranthus parviflorus</i>         | Lamiaceae        | 'Ala'alawainui         | Herb      | I        |

| <i>Sphenomeris chinensis</i>      | Lindsaeaceae   | Pala'a                   | Fern      | I        |
| <i>Spodias dulcis</i>             | Anacardiaceae  | Otaheite apple           | Tree      | A        |
| <i>Sporobolus indicus</i>         | Poaceae        | West Indian dropseed     | Grass     | A        |
| <i>Stachytarpheta jamaicensis</i> | Verbenaceae    | Jamaica vervain          | Shrub     | A        |
| <i>Synedrella nodiflora</i>       | Asteraceae     | Nodeweed                 | Herb      | A        |
| <i>Syngonium auritum</i>          | Araceae        | Five fingers             | Vine      | A        |
| <i>Syzygium cumini</i>            | Myrtaceae      | Java plum                | Tree      | A        |
| <i>Syzygium jambos</i>            | Myrtaceae      | Rose apple               | Tree      | A        |
| <i>Syzygium malaccense</i>        | Myrtaceae      | Mountain apple           | Tree      | P        |
| <i>Terminalia catappa</i>         | Combretaceae   | False kamani             | Tree      | A        |
| <i>Thespesia populnea</i>         | Malvaceae      | Milo                     | Tree      | I        |
| <i>Tournefortia argentea</i>      | Boraginaceae   | Tree heliotrope          | Tree      | A        |
| <i>Urochloa mutica</i>            | Poaceae        | California grass         | Grass     | A        |
| <i>Verbena litoralis</i>          | Verbenaceae    | Owi                      | Herb      | A        |
| <i>Wedelia trilobata</i>          | Asteraceae     | Wedelia                  | Herb      | A        |

Notes: Non-Polynesian-introduced Alien (A), (P) Polynesian-introduced, Indigenous (I), Endemic (I), Endangered (End)

INV, Likely to be invasive in Hawai'i and on other Pacific Islands as determined by the Hawai'i-Pacific Weed Risk Assessment of the USDA Forest Service, based on published sources describing species biology and behavior in Hawaii and/or other parts of the world.

INV-H Documented to cause significant ecological or economic harm in Hawai'i, as determined from published information on the species' current impacts in Hawai'i.

## 1.0 Background

In March 2008, PBR Hawai'i tasked SWCA Environmental Consultants with the description of the marine resources of the Hā'ena State Park. The project encompasses 64 acres within the park boundaries and the adjacent nearshore waters and Kē'e Beach. Information to be provided includes a description of the physical characteristics including shoreline erosion; inventory of biological resources, and an assessment of recreational resources and current visitor impacts. Included in these tasks is a discussion of special design considerations, resource management concepts, and interpretive concepts for marine recreation use.

The overall goal of the project is to plan for a public park that accommodates recreational opportunities, preserves the significant natural, cultural, and scenic resources, and enhances the natural park setting. The objectives of this project include refinement of the draft Community Preferred Master Plan prepared in 1999 by The Keith Companies, Inc., and providing information to support preparation of an EIS for the future development of Hā'ena State Park. The intent is to balance public usage of the park's recreational resources with the protection and preservation of the natural and scenic features and significant cultural resources within, and associated with, the park area.

SWCA conducted extensive literature reviews, and performed brief reconnaissance surveys of marine resources at the park, and compiled geospatial data to prepare resource maps. The report was prepared by Tiffany Thair, B.A., John Ford, M.S., Robert A. Kinzie III, Ph.D., and Ryan Taira, B.A.

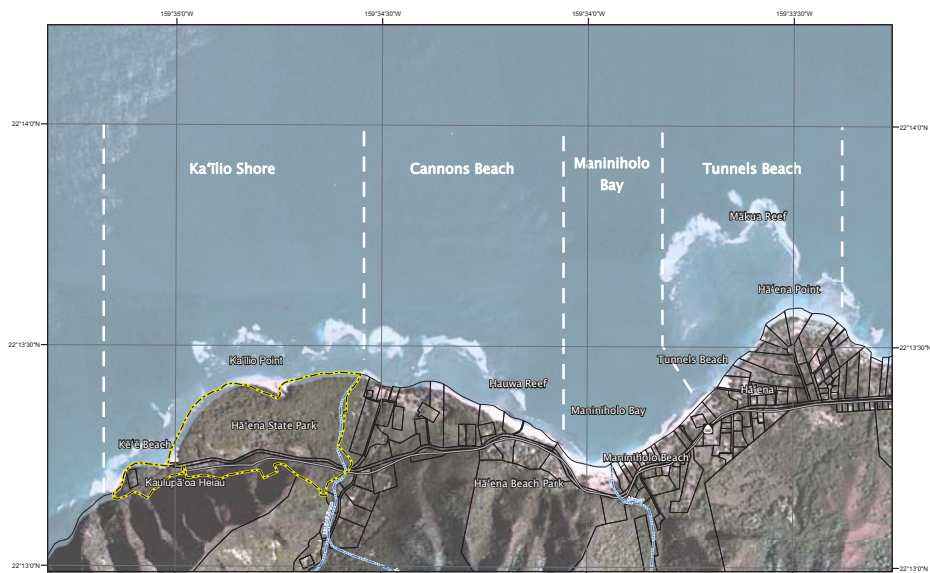

## 2.0 Introduction and Setting of the Coastal Environmental at Hā'ena State Park

Hā'ena State Park is located within Ka'ilio Shore sub-area of Hā'ena (Clark 1992). Four coastal sub-areas are recognized between Kē'e and Hā'ena Point (Figure 1). The beaches of these areas are fringed with scattered beachrock slabs along the water line. The mouth of Limahuli Stream, a small intermittent stream, and freshwater seeps bisect the beach within the Park boundaries. The backbeach area consists of low sand dunes roughly 4 to 8 ft high that are overgrown with ironwood and false kamani trees. The roots of ironwood in many areas are exposed due to erosion by the action of storm waves. Immediately seaward of Kē'e Beach, located within the Ka'ilio Shore, is a shallow lagoon that provides one of the most popular swimming areas in Hawai'i (Clark 1999). The lagoon is formed by a shallow fringing reef platform that joins the shore roughly 200 feet to the east of highway's end at Kē'e Beach.

Clark (1992) provided a comprehensive description of the reef structure within the Park boundaries which remains accurate today. In 2003 and 2007, the Center for Coastal Monitoring and Assessment (CCMA), National Ocean Service, Biogeography Branch, in cooperation with Analytical Laboratories of Hawai'i, published detailed maps of the reef and benthic marine habitat at Hā'ena State Park (Figures 2-4). Sand and reef pavement comprise the dominant marine geomorphologic structures between Kē'e Beach and Maniniholo Bay to the east. From Maniniholo Beach west to Hā'ena Point the reef consists of aggregate reef, scattered coral and rock, and rubble with small patches of reef pavement. The reef pavement is covered with macro-algae, coralline algae, and corals; however, the sandy lagoon floors and channels are uncolonized.

Ocean conditions at the Park are typical of exposed northern coasts in Hawai'i. Between October and May, North Pacific storm swells bring dangerously high surf in excess of 10 feet to the area (Clark 1992). When trade wind swells are prevalent between June and September, surf heights and swells at Hā'ena generally reduced (Clark 1992). North east trade winds are present between 90-95 percent of the year and almost always generate some surf activity on the outer reef margins. Predominant long shore currents run east to west outside the reef. Dangerous rip currents are created in reef channels by storm waves and tidal conditions. Haraguchi (1979) suggested tidal currents ranging from 0.1 to 1.0 knots, and Clark (1992) suggested that such current velocities were not usually a concern for nearshore ocean recreation

activities. Nevertheless, life guards at Kē'e Beach strongly objected to SWCA biologists' plan to conduct snorkel surveys of the outer reef during a day with unusually calm conditions in November 2008.

### 3.0 Beach Erosion

Kē'e Beach and shoreline of Hā'ena State Park are exposed to high surf during the winter months and occasionally during the summer months. Storm waves are responsible for erosion of sand dunes behind the beach. Waves sweeping across the beach undermine ironwood trees, exposing their roots and occasionally toppling them onto the beach. High surf also generates a powerful rip current that runs out the narrow channel at the west end of the lagoon to the open ocean creating a hazard for swimmers and divers.

To determine the extent of erosion and beach loss, the Hawai'i Shoreline Study, an initiative of the University of Hawai'i (UH) Coastal Geology Group (<http://www.soest.hawaii.edu/coasts/>), provides information on shoreline change data to assist in decision-making for actions affecting the coastal zone. The Surfrider Foundation maintains valuable links to beach erosion resources on its website (<http://www.surfrider.org/>).

The shoreline at Hā'ena State Park is subject to a number of natural hazards including tsunami, storm surge, high winds, coastal erosion, sea-level rise, and high waves. Evaluating changes to the configuration of shorelines helps define zones of avoidance for conservation of sensitive areas, and identify appropriate means to mitigation and control beach loss.

The UH erosion study area, bounded by Nāpali coast on the west and Hā'ena Point on the east, encompasses a total of 166 transects. Here the shoreline consists of carbonate sand, exposed beach rock, and basalt boulders deposited by stream discharge. The fringing reefs at Kē'e, Limahuli, and Hā'ena cause waves to break in various directions along the shore. Figure 5 illustrates the draft results of beach loss studies conducted by the UH Coastal Geology Group in the vicinity of Kē'e Beach and Hā'ena State Park. The UH Coastal Geology Group estimated that the overall rate of beach erosion between Kē'e Beach and Hā'ena State Park is -0.9 ft/yr. Along the eastern-most portion of Hā'ena State Park sand is eroding at an average rate of -1.2 ft/yr, while the central area around Limahuli Stream mouth is eroding at an average rate of -1.0 ft/yr.

The western-most area by Kē'e Beach is eroding at an average rate of -0.6 ft/yr. Figure 5 also illustrates the location of historic beach configurations mapped from previous aerial imagery and registered to a common coordinate system through the use of geographic information systems (GIS) technology.

### 4.0 Water Quality

The marine waters of the Hā'ena State Park are considered Class AA coastal waters by the State Department of Health (DOH) (HAR 11-54). Class AA waters possess high ecological and recreational value. It is the objective of Class AA waters that these remain in their natural pristine state as nearly as possible with an absolute minimum of pollution or alteration of water quality from any human-caused source or actions. To the extent possible, the wilderness character of these areas is to be protected.

Within the defined reef at Hā'ena, Class AA waters are bounded by areas less than 18 meters (60 feet) in depth. Uses to be protected in the class of waters include oceanographic research, the support and propagation of shellfish and other marine life, conservation of coral reefs and wilderness areas, compatible recreation, and aesthetic enjoyment. Until recently, the coastal waters of Hā'ena State Park were not actively monitored by DOH. However, in late 2005, the DOH Clean Water Branch (CWB) and the Hanalei Watershed Hui (HWH) joined in the protection of Kaua'i beaches through a partnership between DOH and the community based organization. Hanalei Watershed Hui's involvement allowed DOH to increase the number of beaches that it monitors on Kaua'i, and the frequency at which they are sampled. Hā'ena Beach Park is one of the beaches covered under this agreement.

Table 1 illustrates the results of initial water quality sampling at Hā'ena State Park. DOH (2008) noted that state standards for enterococci were attained at Hā'ena. The reported parameters for temperature, salinity, dissolved oxygen, pH, and turbidity reflect clean coastal waters within Hawai'i DOH water quality

standards for Class AA waters. Coliform and enterococci levels are not reported here, but were found to be within state standards for Class AA waters.

### 5.0 Marine Biological Resources

Clark (1992) presented a general description of marine resources within the Park boundaries. The results of five previous marine studies of Kē'e Beach and reef (The Keith Companies 2001; Stepath 1999); Limahuli Beach and reef (Jokiel and Brown 2000); and nearby Hanalei Bay (Friedlander and Parrish 1998) were cited to prepare a description of the nearshore marine environment. These studies were supplemented with a brief snorkel reconnaissance of the Kē'e Lagoon and inner reef flat conducted on November 3, 2008 by SWCA biologists Dr. Robert Kinzie and John Ford. Additional anecdotal information on species observed by others was obtained from oral histories recorded by Maly and Maly (2003), and related records of interviews with area residents and fishermen (PBR database).

Eighty (80) fish species representing 26 families have been reported from nearshore waters along the north shore of Kaua'i by the four previous surveys referenced above (Table 2). Species abundance and diversity within the Kē'e Lagoon and reef flat is lower than that found at the outer reef/offshore sites (Jokiel and Brown 2000, Stepath 1999, this study), with only 46 species of fishes occurring here. Kē'e Lagoon and reef flat provide an excellent habitat for juvenile reef fishes. Fish assemblages in the Limahuli offshore study site had the greatest number of individuals and highest biomass observed on fish transects around Kaua'i in 1999 (Friedlander 2000). Wrasses, surgeonfishes, and damselfishes comprised the majority of the species observed in the lagoon and along the reef flat at Kē'e. Small schools of weke'ula (*Mulloidichthys vanicolensis*), hinalae lau-wili (*Thalassoma duperrey*), ma'i'i'i (*Acanthurus nigrofasciatus*), omaka (*Stethojulis balteata*), and manini (*Acanthurus triostegus sandvicensis*) were commonly observed within the lagoon and reef flat. For many species, juveniles appeared to be very common along the reef flat.

Fish diversity is much greater on the seaward side of the reef crest and studies conducted nearby, off Limahuli Stream and in Hanalei Bay, recorded over 160 species of fishes in these areas (Jokiel and Brown 2000, Friedlander and Parrish 1998). Friedlander (2000) found that fish biomass at the Limahuli offshore site to be more than twice that observed at the site with the second largest biomass (Ho'ai Bay near Po'ipu offshore) and an order of magnitude greater than the inshore habitat at Limahuli. Among 60 reefs

monitored by the Hawai'i Coral Reef Assessment & Monitoring Program (CRAMP), the shallow reef station (1m) at Limahuli ranked 58 in species richness, 51 in density, 57 in biomass, and 57 in diversity. Limahuli 10m ranked 5 in species richness, 24 in density, 8 in biomass, and 21 in diversity. The most abundant species were the hinalea lauili (*Thalassoma duperrey*) and the kole (*Ctenochaetus strigosus*) at the 3m and 10m reefs respectively. The species with the highest biomass were the manini (*Acanthurus triostegus*) and the māikoiko (*Acanthurus leucopareius*) at the 3m and 10m reefs respectively (Jokiel and Brown 2000).

TABLE 2. List of marine shore fishes observed within and adjacent to Kē'ē Lagoon and Reef Flat, Hā'ena State Park

Fish biomass at the Limahuli offshore site was dominated by large mobile herbivores, mainly surgeonfishes, triggerfishes, and parrotfishes. On the shallow Limahuli reef flat, small wrasses and surgeonfishes made up most of the fish biomass. Friedlander (2000) attributed the high standing stock of fishes observed at this site to the high spatial complexity of the habitat and the relatively light fishing pressure. During winter when high waves pound the exposed north shore of Kaua'i, fishing pressure is further reduced. This situation creates a de facto marine preserve along the north shore for nearly six months each year by excluding fishers from access to nearshore waters within the Park. Little comparable information on the marine invertebrates of Kē'ē Lagoon and reef is available from previous studies; however, the CRAMP studies have monitored benthic invertebrates at Limahuli (Jokiel and Brown 2000) (Table 3). Coral cover rank is 36 among 60 reefs studied statewide. Coral cover was found to be very similar between the 2 sampling periods. Coverage by macro-algae was found to be relatively low; however, there was a high percentage of crustose coralline algae and turf algae present. Despite the proximity to the mouth of Limahuli Stream, a low percentage of fine sediments with low content of terrigenous material was found in this high wave energy environment. No rare or unusual species were observed.

The CRAMP coral cover rank for mid-water (10m or 33 ft) habitat at Limahuli is 31 among the 60 reefs studied statewide (Table 4). As with the shallow station, coral cover was very similar between the 2 sampling periods, and macro-algae coverage was found to be relatively low. As with the shallow reef station, there was a high percentage of crustose coralline algae and turf algae.

Abbott and Hunter (2000) conducted a statewide study to document the location, abundance, and distribution of alien and invasive algae species. A primary objective of their research was to map the distribution of the most prominent alien and invasive species of algae in the state to enable managers to track rates of expansion and invasion of new sites in the future. One of their field research sites included Ka'ilio Point at Hā'ena. No invasive species of marine algae were found on the reef during their studies.

A complete list of algae observed by Abbott and Hunter (2000) within 0 – 5 m (0 – 16 ft) depth in 2000 and 2002 surveys appears in Table 5.

## 6.0 Endangered Marine Species and Habitats

Endangered humpback whales (*Megaptera novaeangliae*) are found seasonally in the offshore waters of Kaua'i's north shore. The marine waters at Hā'ena State Park lie within the Hawaiian Humpback Whale National Marine Sanctuary established under Subtitle C of Public Law 102-587, as amended by Pub. L. 104-283. The sanctuary boundaries of the Kaua'i unit consist of the submerged lands and waters seaward from the shoreline, cutting across the mouths of rivers and streams to the 100-fathom (183 meter) isobath from Ka'ilio Point eastward to Mōkōlea Point (Figure 6).

Among the goals and objectives of the National Marine Sanctuaries Program are to support and coordinate long-term scientific research on the resources on these marine areas; to enhance public awareness and wise use of the areas; and to give particular attention to the protection of the area's natural resource and ecosystem values.

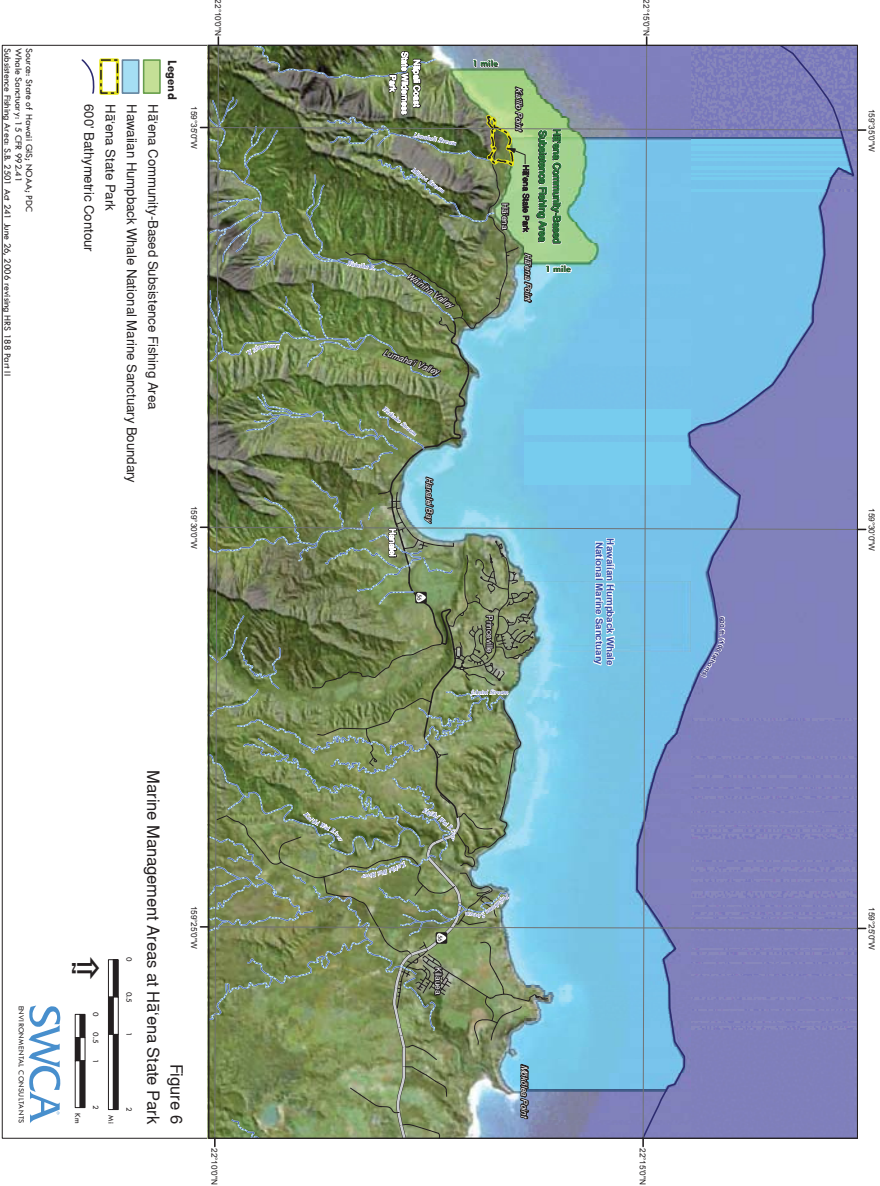

The Hawaiian monk seal (*Monachus schauinslandi*), was listed as an endangered species pursuant to the Endangered Species Act (ESA) on November 23, 1976 (41 FR 51612) and remains listed as endangered. Hawaiian monk seals, regular residents of the Northwest Hawaiian Islands, began appearing more frequently on Kaua'i and Ni'ihau beaches in the 1960's. The National Marine Fisheries Service (NMFS) believes that the total Hawaiian monk seal population is at its lowest level in recorded history and it is estimated that about 1,200 individuals are alive today. They are distributed predominantly in six Northwestern Hawaiian Islands (NWHI), with subpopulations at French Frigate Shoals, Laysan and Lisianski Islands, Pearl and Hermes Reef, and Midway and Kure Atoll. Small numbers also occur at Necker, Nihoa, and in the Main Hawaiian Islands (MHI). In 2005, the total number of individual monk seals in the MHI was estimated to be 77.

The number of monk seals born in the MHI has increased since the mid-1990 (<http://www.fpir.noaa.gov/>). In 2006 and 2007 there were 12 and 13 pups born, respectively, within the MHI. Scientists believe that Hawaiian monk seals are beginning to repopulate the MHI. Only a few females are actually known to have given birth on popular public beaches.

Table 5. Macroalgae observed at Ka'ilio Point, Hā'ena (Abbott and Hunter 2000).

In 1995, 21 male monk seals, and no females, were relocated from the NWHI and released off of the Big Island of Hawai'i. Since their release, only six of these seals have been recently observed and reported. Research has also shown that the monk seals rarely migrate from the NWHI to the MHI. NMFS estimates that there are 31-40 monk seals on Kaua'i today. It is not unusual to find a monk seal resting on any north shore Kaua'i beach. Signs are posted along the beaches at various locations on the shore at Hā'ena State Park warning visitors not to harass resting seals.

The nearshore marine waters and beaches of Hā'ena State Park are not designated as critical habitat for any marine species. However, in July of 2008, the National Marine Fisheries Service (NMFS) received a petition from conservation groups to review and establish revised "critical habitat" for the monk seal.

The Endangered Species Act (ESA) in turn prohibits any changes or "destruction or adverse modification" by Federal activities (those that are federally funded or permitted) to these areas that will diminish its value as important habitat for the survival and recovery of the species. It is important to note that critical habitat designation does not turn an area into a reserve, refuge, Marine Protected Area (MPA) or a park. Public access and usage in areas that are designated as critical habitat are not affected. NMFS is currently reviewing and evaluating the recommendations contained in the petition.

Although threatened Green sea turtle (*Chelonia mydas*) nesting in the Hawaiian Archipelago is mostly limited to French Frigate Shoals (FFS) in the NWHI, they are common around all eight of the main Hawaiian Islands (MHI) (NMFS & USFWS 2007). Green sea turtles are frequently seen grazing upon algae in shallow nearshore reef waters around the north shore of Kaua'i, including the waters of Hā'ena State Park. Although there have been no recent reports of sea turtles nesting on the beach at Hā'ena, there have been 17 reported sea turtle nests on Kaua'i in the past year alone (Heacock, pers. comm.). The sandy beaches within the Hā'ena State Park are suitable for sea turtle nesting, and the possibility of a future turtle nesting there cannot be dismissed.

## 7.0 Recreational Resources and Assessment

### 7.1 Principal Existing Recreational Uses

The beautiful beaches, reef formations, cultural features, and verdant landscape of Kaua'i offer various recreation activities to locals and visitors on the island. The Hā'ena State Park, from Kē'ē Beach to the mouth of Limahuli Stream attracts a large number of visitors each year. The area is a popular spot for scenic shoreline sightseeing and ocean-related recreation. Selected recreation sites and reefs within the Hā'ena State Park boundaries are depicted in Figure 7.

The popularity of this region for recreation has increased dramatically over the past several decades. It has been estimated that Hā'ena State Park receives roughly 1,500 visitors during low periods (February) and approximately 10,600 visitors during high peak periods (August) (TKC and Earthplan 2001). Stepath (1999) counted approximately 1,250 people visiting the Kē'ē area for recreation daily during his study in June and July 1999. He found that people use the lagoon and reef flat area is highest between 10 a.m. and 6 p.m. with a peak usage at 4 p.m.

Other popular recreation areas adjacent to Hā'ena State Park include Cannons Beach, Maninihola Beach, and Tunnels Beach. Use of the beach and nearshore waters at Hā'ena State Park are regulated by the Hawai'i Administrative Rules (HAR) for Shore Waters and Shores, Chapter 2: North Shore Kaua'i Ocean Recreation Management Area.

#### 7.1.1 Shoreline Sightseeing

The scenic shoreline resources at Hā'ena State Park make the area an important sightseeing spot for visitors to the island. The shoreline offers views of tropical vegetation, steep mountains, sandy beaches,

ocean waters, colorful sunsets, and the Nāpali coastline. These features make it a destination point for many tourists (TKC and Earthplan 2001, Sprout and Sprout 2004, Klein 2007).

#### 7.1.2 Beachcombing

Due to the frequency and severity of heavy surf on the northern portion of Kaua'i, shells and other marine debris are often dislodged from the reefs and carried to shore. As a result, many of the beaches in the area are popular beachcombing spots for collecting driftwood, beach glass, micro-mollusks, cats' eyes, and puka shells. Ka'ilio Shore at the east end of the beach adjacent to Limahuli Stream is one of the best shell collecting sites (Clark 1992).

#### 7.1.3 Sunbathing

Sunbathing is a popular activity throughout the Hawaiian Islands. Sunbathing occurs at many beaches along Hā'ena State Park. The most level and widest beach section within the park is at Ka'ilio Point near Limahuli Stream. From this point, the beach narrows and becomes steeper before widening again at the lagoon. Kē'ē Beach is popular with tourists for sunbathing. Stepath (1999) found that sunbathing was the most common activity at Kē'ē Beach in June and July of 1999. Sunbathing is difficult at some areas on this part of the island during periods of heavy trade winds (Clark 1992). Clark (1992, 1999) found that visitors preferred Kē'ē Beach over Ka'ilio Point due to the convenience of showers, restrooms, and paved parking.

#### 7.1.4 Hiking

Although there are no maintained hiking trails within the Hā'ena State Park, the trailhead to the famous 11-mile Kalalau Trail is located in the project area at the end of Kūhiō Highway. This trail provides access to the Nāpali Coast State Wilderness Park, which had 423,100 recreation visits in 2007 (DBEDT 2008). Kalalau Trail traverses five steep valleys before terminating at Kalalau Beach. The first two miles of the trail, from Hā'ena State Park to Hanakāpī'ai Beach is a popular day hike for visitors. Day-use hiking permits are required for users hiking beyond Hanakāpī'ai valley and camping permits are required for overnight hikers (Division of State Parks 2008).

#### 7.1.5 Swimming

There are two ocean swimming areas in the vicinity of the project area located at Pōhōlokeiki and Kē'ē Beach. Pōhōlokeiki Channel is located where Limahuli Stream meets the shoreline. It was formed by the freshwater discharge of Limahuli Stream, which created a narrow waterway through the reef offshore. The channel offers a protected swimming area under calm ocean conditions. The water is slightly colder and less saline in the channel due to the freshwater discharge from Limahuli Stream. The suggested swimmer level for this site is "intermediate and advanced swimmers eight year of age and older" (Clark 1992). Some visitors or residents occasionally use the lower reaches of Limahuli Stream as a freshwater dipping and wading area. The level of use of Limahuli Stream for this activity is not known (TKC and Earthplan 2001).

Kē'ē Lagoon is located at the west end of Kē'ē Beach and is considered to be of statewide importance for recreational swimming. The lagoon's sandy bottom slopes gradually toward the sea to a depth of roughly 10 ft. It is connected to the open ocean by a deep, narrow channel through the reef (referred to as Puka Ulua). This swimming area is protected by the west end of Ka'ilio Reef making it suitable for all ages and swimming levels. Because of the calm, protected conditions, it is very popular with tourists and families with children. However, during periods of high surf, there is a powerful rip current that runs out the narrow channel (Clark 1999). As of 2008, there are at least two lifeguards on duty at this beach from 9A.M. to 5P.M. everyday of the year, including holidays (Yuen, PBR, pers. comm.)

### 7.1.6 Picnicking

Visitors and local residents use the beach at Hā'ena State Park for picnicking. Currently, there are no tables or barbecue areas;

### 7.1.7 Shorefishing

Although no statistics on shorefishing could be found for the Park, Hamnett et al (2004) noted that approximately 109,055 households in the state, or 31 percent of all households, enjoyed recreational fishing in 2004. Twenty-six percent of this total used pole and line fishing. The shoreline along Hā'ena State Park is an important recreational fishing area. Pole fishing is popular off the point at Kē'e. At low tide, pole fishing also occurs off the west end of Kē'e Lagoon. Throw-net fishing is conducted on the reef margins of the lagoon. Free dive spear fishing (without the use of SCUBA) is also popular in the area. The frequency of shoreline fishing activity increases during spring and summer when the ocean is calm more often. Fishers typically arrive at the Hā'ena State Park very early in the morning or after dark (Clark 1992).

The most valuable information on traditional fishing in the vicinity of the comes from the personal interviews of local fishermen and kupuna (Maly and Maly 2003). Several prominent local fishers from Hā'ena related stories to Maly and Maly (2003) of their fishing experience in the nearshore waters for honu (sea turtle), akule (bigeye scad), moi (Pacific threadfin), 'ama 'ama (mullet), 'ōio (bonefish), nenu (rudderfish), aholehole (flagtail), 'āweoweo (Hawaiian bigeye), manini (convict tang), kala (bluespine unicornfish), 'oama (juvenile goatfish), kumu (whitesaddle goatfish), pāpio and ulua (various species of jacks), he'e (octopus), ula (lobsters), 'a'ama (crab), and several kinds of limu (seaweed). Kahala (amberjack) and 'ōpelu (mackerel scad), 'Ahi (yellowfin tuna), ono (wahoo), aku (skipjack tuna), mahi-mahi (Dorado) were commonly caught offshore from Hā'ena.

A simple Google query of "fishing" + "Hā'ena" returns 52 pages of travel guides, vacation rentals, and real estate advertisements that entice visitors to the north shore of the Garden Isle, but with little substantive information about fishing and fisheries of the North Shore. Concern about the impact of visitors on reef resources of Hā'ena led to the enactment of a new law creating a community-based subsistence fishery area. On June 26, 2006, Hawai'i Governor Linda Lingle signed into law Act 241 to help protect the fish stocks and coral reef habitats within the ahupua'a of Hā'ena. The Act took effect on June 30, 2007. The act states that the waters of Hā'ena have been an important subsistence fishery resource for native Hawaiians and local families of the ahupua'a, and that the area's natural beauty attracts thousands of visitors each year to the 'end of the road' at Hā'ena State Park. It is believed that the influx of visitors has resulted in adverse impacts to fish stocks and the integrity of the coral reef habitats in the area. The purpose of the Act is to allow inhabitants of the ahupua'a to develop and enforce traditional regulations for the maintenance of the fishery within the Hā'ena ahupua'a. The approximate boundaries of the new subsistence fishing area are shown in Figure 6. Commercial activities, issuance of a commercial marine license, aquarium fishing permits, gill net fishing, spear fishing with SCUBA, must still be considered for approval by DLNR in consultation with the inhabitants of the ahupua'a.

In 2002, DOH statistics reported a single case of ciguatera poisoning from consumption of a knifejaw (*Oplegnathus* sp.) caught at Hā'ena.

### 7.1.8 Snorkeling and SCUBA Diving

Kē'e Beach is a primary snorkeling and diving area for Kaua'i. Snorkeling and diving occur in the protected Kē'e Lagoon and back reef, and less often outside the reef. This activity includes organized groups of divers from clubs and classes as well as individual divers. The overhangs, tunnels, and unique reef features attract many divers. These features, in combination with excellent water visibility and protection from heavy surf, make the lagoon a popular snorkeling and diving spot (Clark 1992). Outside

of the reef, intermediate and advanced snorkeling and diving also occur during calm conditions. Reef features in this area are similar to those in the lagoon, but fish diversity and abundance is higher (Clark 1992). The quality of diving decreases in the winter due to high surf and turbidity (Nielsen 2005).

Cannon's Reef is a popular shore diving site just east of Hā'ena State Park. Water depths at this site range from 5 to 70 ft (1.5-21 m). This diving spot is suitable for beginner to intermediate divers and is considered a good snorkeling location (Nielsen 2005).

### 7.1.13 Off the Road Vehicle (ORV) Use

The 2001 draft park plan noted that ORVs were known to drive through the sand dunes and across the sandy beaches at Ka'ilio Point flattening dunes and impacting strand species (Clark 1992, DLNR 1999). However, this activity has essentially ceased since 2007 when a gate blocking vehicular access to the dunes was installed. Four-wheel ATVs are also used by lifeguards and can be driven along the sandy beaches as necessary in the pursuit of their duties.

### 7.1.14 Visiting Historical/Cultural Sites

Historical and cultural sites have the potential to be recreational and educational areas for both local residents and tourists. The cultural resources at the Hā'ena State Park are considered to be some of the most complete and well preserved features throughout the Hawaiian Islands. The Hā'ena Archaeological Complex is listed on the State and National Registers of Historic Sites. The Complex is bounded by the Pacific Ocean on the north and west, Limahuli Stream on the east, and the pali (cliff) base on the south. Feature types found within the Hā'ena Archaeological Complex include heiau, house platforms, rock shelters, agricultural complexes, enclosures, subsurface cultural deposits, cemeteries, wet caves, and source areas for volcanic glass (TKC and Earthplan 2001).

Tourists and residents can visit Keahualaka, a flat hula platform, and Kauluapā'oa Heiau, a temple dedicated to Laka, the goddess of the hula. These cultural sites are located southwest of Kē'e Beach and are managed by the State Historic Preservation Division (SHPD) on land owned by the County. Both sites are presently used by hula halau from across the state for various ceremonies (Clark 1999).

Two wet caves situated in the Hā'ena State Park are also premier designations for visitors and residents. These ancient sea caves were formed during a higher stand of sea. Waiakanaloa Wet Cave is located mauka of Kuhio Highway in the face of the pali and Waikapala'e Wet Cave is located slightly to the east within the pali face. These deep, dark caves contain pools of cold water (Yamamoto 2006). "Spiritual" cave visits, using incense and other paraphernalia, are popular visitor activities within the caves (TKC and Earthplan 2001).

### 7.1.15 Wildlife Observation

Whale watching and bird watching also takes place occasionally within the park boundaries. The peak time to see endangered North Pacific Humpback whales in Hawaiian waters is late November through early May (Yamamoto 2007). Several tour operators offer whale watching tours within the boundaries of the Hawaiian Humpback Whale National Marine Sanctuary (Figure 6).

## 7.2 Visitor Impacts

### 7.2.1 Traffic Congestion and Parking Issues

Two of the most popular visitor destination areas on Kaua'i are located within the boundaries of Hā'ena State Park. Both the Kalalau Trail head and Kē'e Beach are located at the end of the highway. The end of the highway serves as a turnaround point for all vehicles reaching this point. There are only three parking areas within the Park, one is located adjacent to the sea caves at Hā'ena Point, another was recently created near the taro ponds west of the sea caves, and the third is located at the end of the highway at Kē'e Beach. On the lot at the end of the highway is paved. As these fill, many visitors parallel park along the seaward side of the highway margin. A high density of visitors to the area decreases the amount of available parking for local residents, and reduces the quality of user experiences (Needham et al. 2008).

### 7.2.2 Non-point and Point-Source Pollution

Point-source pollution is pollution from any confined or discrete conveyance such as pipes, ditches, channels, wells, or vessels. This type of pollution is also referred to as "end-of-pipe discharge" because it is often discharged from sewage treatment plants and factories close to nearshore waters (DBEDT and DOH 2000). At the Hā'ena State Park, recreational and commercial boats can create point source pollution in the offshore waters. The amount of point source pollution from these sources is unknown and likely varies during the year depending on the number of boats.

*Hawai'i's Implementation Plan for Polluted Runoff Control* (2001) defines non-point source pollution as "water pollution that comes from many diffuse sources rather than from a specific point, such as an outfall pipe, and is often the result of human activities." Pollutants are carried by rainwater on the surface or through the ground to the stream and oceans. These pollutants can include fertilizers, herbicides, insecticides, oil, grease, sediment, and pathogens (DBEDT and DOH 2000). Non-point source pollution is related to the amount of impervious surfaces in an area. Impervious surfaces (including roads, parking lots, sidewalks, and roofs) prevent water and pollutants from passing through the ground and percolating into the soil, expressing them into nearby aquatic environments (Schueler 1994).

At the Hā'ena State Park, pollutants from motor vehicles, trash, and other debris not properly disposed of can be carried to nearshore and freshwater areas in storm, flood, or wash water across impervious surfaces. Sewage seepage from the restroom facilities could also enter these aquatic environments (Stepath 1999). Dipping or wading in the Limahuli Stream may contribute to soil erosion, sedimentation, and temporary impacts to water quality (TKC and Earthplan 2001).

According to the *Hawai'i Coastal Nonpoint Pollution Control Management Plan* (1996), non-point source pollution has a greater impact on nearshore waters than point-source pollution. Non-point source pollution can result in increased turbidity, sediment accumulation on coral reefs, fish kills, and destruction of aquatic habitats. Excess nutrients can also lead to eutrophication or algae blooms in coastal waters (DBEDT and DOH 2000). Toxic chemicals and pollutants can pose a risk to marine plants and animals (County of Kaua'i Planning Department 2000) and increase the risk of human diseases during aquatic recreation (DBEDT and DOH 2000).

Clean coastal water is an important component of the tourism industry in Hawai'i. More than 80% of visitors to the Islands engage in recreation activities in coastal and marine areas (Needham et al. 2008). Coastal leisure and recreation activities (swimming, diving, surfing, etc) are also vital to native Hawaiian cultural practices and local resident recreation (DBEDT and DOH 2000). Most local residents engage in ocean recreation on a regular basis (Friedlander et al. 2008). One intent of Class AA marine water quality designation at Hā'ena State Park is to protect the area in as pristine condition as possible to help insure the protection of the coral reef ecosystem offshore as well as the visitor experience to the Park.

### 7.2.3 Sunscreens

Some chemicals contained in commercial sunscreens can adversely impact coral reefs by promoting viral infections of endosymbiotic zooxanthellae, which are essential for the survival of coral species. The chemical compounds in sunscreen can cause dormant viruses present in zooxanthellae to continually replicate until the zooxanthellae are expelled and the coral is bleached (Buddemeier et al. 2004, Danovaro et al. 2008, and Than 2008). Sunscreens may also decrease the penetration of UV radiation, impacting marine organisms that depend on light for various functions (Eichenseher 2006, Blitz and Norton 2008). Furthermore, sunscreen agents have been shown to bioconcentrate in freshwater or brackish aquatic species (Daughton and Ternes 1999). The impact of sunscreen on the coral reef environment at the Hā'ena State Park is not known; however, according to scientific interviews by Juran (2007), the impact of sunscreen at the park is believed to be minimal compared to other sites around the state.

### 7.2.4 Fishing

The impact of recreational and subsistence fishing in Hawai'i has been difficult to quantify because neither recreational and subsistence fishers are required to have licenses or report their catch to the Hawai'i Division of Aquatic Resources (Friedlander et al. 2008, Zeller et al. 2008). Recently, however, there is a growing body of scientific evidence to suggest that fishing may have the greatest overall effect on the diversity and abundance of nearshore fishes on coral reefs in Hawai'i and the Pacific (Grigg 1994, Stepath 1999, Birkeland and Friedlander 2001, Williams et al 2008, Singh et al 2008).

Fishers of all kinds tend to target specific species, many of which are top carnivores. Today, these resources are scarce. In studies of shore fish populations throughout the main Hawaiian Islands, Friedlander et al (2003) found that fish standing stock and diversity were higher in areas protected from fishing pressure and in areas of greater substrate complexity. In a similar island-wide study of 89 coral reef survey sites, Williams et al (2008) found 'clear and consistent negative associations between human population density and biomass of fishes in a range of functional and taxonomic groupings'.

Declines were evident among fishes targeted by fishers, but not among non-target groups of fishes in hard bottom and mid-depth habitats. Standing stock of highly desired target species (e.g. surgeonfishes, wrasses, parrotfishes, snappers, goatfishes, big-eyes, jacks, squirrelfishes, barracuda, moi, milkfish, and hawkfish) in accessible and populous locations were significantly lower than in areas where public access was prevented and also in lightly populated or remote areas. Williams et al (2008) concluded that a number of lines of evidence point to fishing pressure as the prime driver for these negative trends.

Indiscriminant use and discard of inexpensive monofilament gillnets has had a major effect on reef fish throughout the state of Hawai'i (Endreson et al, undated). Lay gillnets take unwanted as well as target species and can lead to habitat destruction and fatal entanglement of endangered species. Objections to this controversial method of fishing have raised an emotional debate in Hawai'i (e.g. <http://www.ulua-ishing.com/forum>; <http://gillnetkill.blogspot.com/>). A general consensus to outlaw the indiscriminate use of lay gillnets (Fair Catch 2006) resulted in the enactment of new DLNR Administration Rules signed by Governor Linda Lingle in March 2007 which severely restrict the use of lay gillnets in Hawai'i.

Night spear fishing, particularly with SCUBA, has also been implicated as being detrimental to fish populations (e.g. Stepath 1999). No studies could be found that quantify the catch by free dive and SCUBA spearfishers at Hā'ena State Park or elsewhere in the state. In May 1981, a visitor disappeared while spearfishing with SCUBA at the Park, presumably the victim of shark attack.

Fishing can also adversely affect endangered marine species. During the period 1982-2007, there have been 49 documented cases of interactions between fishers and monk seals in the Main Hawaiian Islands (MHI) (Katekaru 2008). Twenty-seven of these cases were reported from Kaua'i, two of which were from Hā'ena State Park. These cases usually involved the accidental hooking by ulua fishers using slide-bait tackle.

Chaloupka et al (2008) investigated cause-specific temporal and spatial trends in sea turtle strandings in the Hawaiian Archipelago. The most common known cause of the green turtle strandings was tumor-forming disease (28%) followed by hook-and-line fishing gear-induced trauma (7%), gillnet fishing gear-induced trauma (5%), boat strike (2.5%), and shark attack (2.7%). Miscellaneous causes comprised 5.4 percent of strandings whereas 49 percent of green turtle strandings could not be attributed to any known cause (Chaloupka et al 2008). They concluded that the Hawaiian green turtle stock continues to recover following protection since the late 1970s despite exposure to disease, nets, and hook-and-line fishing gear.

### 7.2.5 Diving

Damage to coral reef as a result of diving has been documented worldwide (Rouphael and Inglis 1995, Tratalos and Austin 2001, and Tabata 1992). Divers and snorkelers can physically damage reef corals, invertebrates, and algae by standing on the reef, accidentally kicking coral with their fins, or stirring up silt that suffocates coral. Contact with corals can facilitate disease transmission. Physical damage to coral species can be long lasting since due to generally slow tissue regeneration (Davenport and Davenport 2006).

### 7.2.6 Fish Feeding

Some divers and snorkelers feed fish at Kē'e Lagoon in order to attract large schools of fish. Feeding fish can disrupt normal distribution and abundance patterns (DLNR 1999, SPC Fisheries 2004) and alter normal reproductive output of marine species (Sweatman 1996). Fish feeding may modify natural feeding cycles of fish (Roberts 2006), and have negative effects on prey populations by minimizing feeding on algae (Milazzo et al. 2005, Hollier 2009).

Feeding large fish can attract predators that scare off smaller fish, thereby reducing local biodiversity (Davenport and Davenport 2006). This activity has been shown to interfere with natural instincts and behaviors essential for fish survival (Roberts 2006). Studies conclude that feeding fish alters fish behavior towards humans; fish become conditioned to associate humans with food, often causing fish to become aggressive to humans and inducing attacks (DLNR 1999, SPC Fisheries 2004, Roberts 2006, Hollier 2009).

### 7.2.7 Reef Walking

During periods of low tide and calm waters, it is possible to walk on the exposed and shallow reef flats at the Hā'ena State Park. Visitors walk on the reef to view tide pools (Yamamoto 2006) and some divers transverse the coral reef to dive off the outer portion of the reef at Kē'e Beach (Stepath 1999), resulting in the same impacts discussed in Section 7.2.5 above. Walking on the reef has the potential to degrade areas of the reef flat by trampling corals. This can result in mortality and an overall reduction in coral cover (Woodland and Hooper 1977, Stepath 1999, Juran 2007, Rodgers and Jokiel 2007). Trampling can directly or indirectly affect coral tissue, growth rates, reproductive success, and community structure (Liddle and Kay 1987, Rodgers and Jokiel 2007).

A decrease in coral cover can also impact fish populations, which are dependent on coral for shelter (Rodgers and Cox 2003), as well as algal populations (Davenport and Davenport 2006). Impacts to coral reefs can be severe, even with relatively low levels of trampling (Brown and Taylor 1999, Rodgers and Jokiel 2007). The ability of corals to withstand trampling depends on coral morphology, branch geometry, and mechanical properties (Rodgers and Jokiel 2007).

In Hawai'i, studies have found a clear pattern of decreasing coral cover with increased visitor use (Rodgers 2001, Rodgers and Cox 2003, Rodgers et al. 2003). Stepath (1999) conducted a study at Hā'ena State Park which studied the impact of humans walking on the reef flat. The peak time of reef walking was at 1:30PM. Stepath (1999) concluded that trampling may be decreasing coral cover in the nearshore waters of the Park.

### 7.2.8 Sand Dunes

Within the vicinity of Hā'ena State Park, the shoreline is backed by low coastal sand dunes. These ridges or mounds of sand are formed by an accumulation of wind blown sand that is trapped by strand plants at the Park. Sand dunes are dynamic features that erode during periods of high waves (usually October to May) and accrete when heavy wave action subsides (usually May to October). Sand dunes function as

natural, elevated buffers that protect marine shorelines against erosion, flooding, high waves, storms, tsunamis, and other coastal hazards (Clark 1992, University of Hawai'i Sea Grant Extension Service and County of Maui Planning Department 1997, University of Hawai'i 2006).

Some recreational activities are known to affect coastal dunes in Hawai'i. The continuous trampling by vehicles and pedestrians on the dunes causes erosion and sand movement. Vogt (1979) found that fewer than 10,000 pedestrians walking over sand dunes during a single season can eliminate dune vegetation and result in erosion (Tabata 1980). Dune vegetation has little resistance to trampling due to the extremely low soil penetration and is slow to recover (Davenport and Davenport 2006).

ORVs also flatten dunes and impact strand species (DLNR 1999). ORVs drive through the sand dunes and across the sandy beaches at Ka'ilio Point (Clark 1992). Both motor vehicles and pedestrian traffic can lead to sediment disruption and erosion. ORVs destroy sand coastal vegetation that helps to stabilize the dunes. ORVs can also disturb sand dune and shore ecosystems for use by wildlife including birds, turtles, worms, and crustaceans (Schlachter et al. 2008).

#### 7.2.9 Invasive Species

An invasive species is defined as "an alien species whose introduction does or is likely to cause economic or environmental harm or harm to human health" (Executive Order 13112). Isolated island ecosystems, such as Hawai'i, are vulnerable to the establishment of alien or non-native species due to a variety of factors. Islands typically have high habitat diversity, favorable climate, high resource availability, low biotic resistance, small populations, and limited social capital (Denslow et al. 2008). It is estimated that over 5,000 alien species have established in the Hawaiian Islands. Of this total, roughly 343 are marine species (Belt Collins Hawai'i LTD 2008).

Invasive species affect island ecosystems in a variety of ways. They compete with native flora and fauna, carry diseases, affect trophic structure, change fire regimes, alter nutrient cycling patterns, modify surface runoff of water, and alter biodiversity (Vitousek 1990, D'Antonio and Vitousek 1992, Vitousek 1992, and Belt Collins Hawai'i LTD 2008). The ability of invasive species to reach new areas is influenced by the number of individuals involved in a release event and the number of release events, also referred to as *propagule pressure* (Lockwood et al 2005). Propagule pressure increases in areas with high visitation (Leung and Mandrak 2007), such as recreational parks. In particular, recreational boating, diving, snorkeling, and fishing increases the risk of introducing non-native species through hulls, wetsuits, bait, or other equipment (Meliene and Hewitt 2005). Recreational hiking can also introduce invasive species, especially plants, by passive dispersal on hiker's shoes and clothing. Ironwood (*Casuarina equisetifolia*), false kamani (*Terminalia catappa*) are invasive terrestrial plant species found within the park boundaries that compete with native vegetation.

Two non-native reef fish species introduced by the Hawai'i Department of Land and Natural Resources Division of Aquatic Resources to supplement coastal sport fisheries are present in the nearshore waters of the Park. Although the predatory grouper roi (*Cephalopholis argus*) and the blue line snapper ta'ape (*Lutjanus kasmira*) successfully established large populations throughout the main Hawaiian Islands, their impact upon preferred local species has not been well-understood and is the subject of controversy. Roi feed on small fishes over shallow reefs, while ta'ape feeds over sand flats during the night (Dierking 2007, Birkeland and Dierking 2007).

Invasions by non-native limu (seaweed) in some areas of Hawai'i have been shown to blanket coral reefs, kill coral, and reduce water exchange within the reef (Hadfield and Koehl 2007). However, none of the four noxious invasive algae species known from Hawai'i were found at Hā'ena during surveys conducted there a decade ago by University of Hawai'i investigators Isabella Abbott and Cynthia Hunter ([www.hawaii.edu/ssri/hcri/text/research/results/kauai/haena.html](http://www.hawaii.edu/ssri/hcri/text/research/results/kauai/haena.html)). Some native algae species have the potential to become invasive, or to dominate the marine substrata to the exclusion of other species, in

areas that receive excessive nutrient input or have been altered in some other way in which to foster the growth of a single species of algae. There is no evidence that this has become a problem at Hā'ena.

#### 7.3 Park Management Requirements

The natural beauty and cultural features at the Hā'ena State Park depend on the proper management and use of the park. Management policies derived from the *Hā'ena State Park Master Plan and Draft Environmental Impact Statement* (2001) include the following:

- Prevent and rectify existing anthropogenic erosion;
- Upgrade wastewater facilities;
- Eliminate or control exotic plant species;
- Utilize non-chemical plant management techniques when feasible; and
- Identify and protect fragile habitats;

*Kaua'i's Economic Development Plan 2005-2015* (2004) states that the island's parks require "improvements and better maintenance" in order to meet recreational demands. In particular, roads are inadequate for residents and visitors. The plan suggests dedicated user fees be initiated at all state parks to support maintenance and improvement costs.

DLNR, DAR, and Hawai'i Ecotourism Association (2005) suggest that coastal and marine recreation areas can be managed by reducing human uses or reducing the impact of human use. The strategy specifically identifies the following management techniques for coastal and marine recreation areas:

- Restrict access: reduce the level of use by determining a site's carrying capacity and setting limits on number of users or banning certain types of activities or behaviors;
- Relocate use: create artificial reefs for recreation users (in suitable areas);
- Education: modify human behavior through signage, brochures, videos, tours, etc.; and
- Mechanisms for compliance: design physical infrastructure to encourage certain limits or behaviors or institute legal or voluntary compliances with tangible consequences.

#### 7.4 Sustainability of Recreational Uses

With proper management, most of the recreational uses currently occurring at the Hā'ena State Park can be sustainable. The sustainability of a recreational use depends on the carrying capacity of the recreational area. Within a recreational context, carrying capacity can be defined as "the amount of visitor use that can be appropriately accommodated within a park or outdoor recreation area" while providing "sustained quality recreational experiences" (Lankford et al. 2005). The carrying capacity of a recreational use is determined by evaluating the following issues:

- Physical capacity: the amount of space available for the recreational use;
- Ecological or biological capacity: the ability of natural resources to withstand the recreational use;
- Facility capacity: the degree that the recreational area is able to support visitor needs during the recreational use; and
- Social capacity: the ability of the recreational use to provide an acceptable recreation experience (Lankford et al 2005).

DLNR, DAR, and Hawai'i Ecotourism Association (2005) recommended development of a carrying capacity tool to help determine optimal levels of activity for the various users at various sites. Management actions stemming from such a study might include limits on commercial operating permits and regulated visitor and vehicle entry. The report also advances the concept of establishing an ecological carrying capacity to take into account the various recreational activities and the unique physical conditions at a particular reef site; to provide a sound scientific basis for proactive management;

and to allow managers to identify optimal levels of use and set limits of use and set limits for various sites before projected increases in use occur. Additional recreational impacts to reefs and local action strategies (RIS-LAS) of pertinent to Hā'ena State Park can be found in DLNR, DAR, and Hawai'i Ecotourism Association (2005).

A study of this kind may be beneficial to identify the sustainability of existing recreational uses within the Park boundaries. To be successful, a carrying capacity study should be adequately funded and should be conducted with the collaboration of stakeholder groups in particularly controversial projects (NOAA 2007).

## 7.5 Complementary and Conflicting Use Issues

There is a growing number of eco-tourists and adventure-tourists who seek remote locations in Hawai'i, such as Hā'ena and Nāpali, for recreation and adventure. Many Hawai'i residents also visit these remote areas in search of greater resources, such as free diving spearfishers, who travel throughout the state to find populations of their preferred game fishes. These remote areas traditionally had small populations of local residents, many of whom rely upon the environment for sustenance (Friedlander et al. 2008). As visitor and resident populations on the north shore of Kaua'i, conflicts among and between recreational users are likely to increase.

### 7.5.1 Ahupua'a 'Ohana vs. Visitor and Other Residents

Ahupua'a 'ohana (family) are former Hā'ena residents and their descendants who have ancestors from the ahupua'a of Hā'ena and therefore have close ties to the land. Some private land was condemned from the ahupua'a 'ohana for the park establishment. Many members of the Hā'ena 'ohana are upset about the existing conditions of the park. Their specific complaints include rubbish on the beaches and trails, spiritual rituals conducted by visitors, souvenir vending, disturbing fishermen, harassing marine life, inappropriate public activities, commercial activities, and failure to heed traditional community protocols. Many believe these activities degrade the natural resources and cultural significance of the area (TKC and Earthplan 2001).

Some ahupua'a 'ohana members also feel that walking on the reef and using suntan oil in the area have a negative impact on the marine species, specifically limu (algae) that they collect for food. Because of the density of visitors to the park, the local 'ohana claim that can not practice cultural activities or enjoy the environment as they did in the past (Stepath 1999, TKC and Earthplan 2001). In turn, the ahupua'a 'ohana believe that denying them access affects their physical, mental, and spiritual health (Juran 2007).

### 7.5.2 Residents vs. Visitors

Residents in the Hā'ena area use Hā'ena State Park for various recreational activities, such as picnicking, camping, fishing, and windsurfing. Though residents consider the park, and especially Ke'e Beach, to be their personal recreation area (TKC and Earthplan 2001), some will not go to the area because of the large number of tourists. Other property owners have denied public access to the beach (Juran 2007). According to a 2002 tourism study (Kaua'i Economic Development Board 2004), Kaua'i residents are more strongly opposed to increased tourism activity than the residents of any other island in the state.

Traffic congestion and parking are major user conflicts between residents and visitors. This congestion is the result of the popularity of Ke'e Beach and the location of the entry point to the Kalalau trail head at the end of the highway (TKC and Earthplan 2001). A State Park Visitors Survey conducted in 2006, found between as many as 451 cars parked at the Hā'ena State Park per day. Of this total, only 13 percent were thought to be locally owned (Hā'ena State Park Visitors Survey 2006).

Residents tend to prefer Ke'e Beach area to other sub-areas of the Park (Figure 1), and enjoy the lax enforcement and rules, vehicle access, and convenient location. Residents have requested better comfort stations and other amenities at the park. Visitors have requested improvements for security and safety, as well as upgrading existing comfort stations (TKC and Earthplan 2001).

Some residents believe that visitors should be paying fees to offset impacts to the Hā'ena State Park. All State Parks receive money through the State Parks Special Fund which is generated through camping fees, cabin rentals, concessions leases, and recreational leases (DLNR 2003). Funding may be allocated from the Hawai'i Tourism Authority's Transient Accommodations Tax (TAT) Trust Fund depending on the amount of money in the fund (DLNR 2003). Therefore, if visitors to the Hā'ena State Park are not staying at nearby hotels, residents argue that they are not paying for enjoyment of the area.

### 7.5.3 Recreation vs. Conservation

Resource conservation is outlined as an important issue in the State Comprehensive Outdoor Recreation Plan (2003). The unique natural environment of Hawai'i is one of the main attractions for tourists. Preserving nearshore ecosystems in Hawai'i is critical to the tourism industry (Rodgers and Jokiel 2007). However, the need to conserve can constrain public access if the activity has the potential to endanger resources.

Solving this conflict requires a balance between allowing public access for recreation and restricting some public use to protect resources (DLNR 2003). As at other coastal recreation areas in the state, there is a need to measure and monitor recreation carrying capacity and to establish indicators to ensure that coastal resources (as well as user experiences) do not deteriorate (Needham et al. 2008).

### 7.5.4 Commercial Use vs. Private Use

Hā'ena State Park is widely promoted in visitor's guides, adventure travel books, equipment rental facilities, hotels, and tour companies (TKC and Earthplan 2001). Commercial activities occurring in the park boundaries include weddings on Ke'e Beach, kayak tours of Nāpali Coast, spiritual enlightenment tour groups, SCUBA diving instruction, and other commercial operators. Residents and native Hawaiians generally do not support having commercial activities at the Hā'ena State Park arguing that they degrade and exploit resources (TKC and Earthplan 2001). Furthermore, many residents or visitors would prefer to enjoy park without commercial operators, while others require a vendor to provide them with the necessary equipment (TKC and Earthplan 2001).

All private enterprises are required to have a state issued Special Use Permit from the Division of State Parks to conduct these activities on State owned lands. Commercial permits can provide a way to ensure compliance with legal requirements (DLNR, DAR, Hawai'i Ecotourism Association 2005); however, most commercial businesses which occur at Hā'ena State Park are not sanctioned by the State (TKC and Earthplan 2001).

### 7.5.5 Ecotourism vs. Development

Ecotourism is one of the fastest growing sectors of the tourism industry. According to the International Ecotourism Society, ecotourism is "responsible travel to natural areas that conserves the environment and improves the well-being of local people" (Blangy and Mehta 2006). Ecotourism in Hawai'i can be nature or culture based (<http://www.hawaii.ecotourism.org/Default.aspx?pageId=117830>). This type of tourism is designed to prevent negative social and environmental impacts that can be associated with tourism (DLNR 2003). Development has the potential to adversely impact natural and cultural resources on which the ecotourism industry relies on.

“Hard-core” eco-tourists typically seek isolated destinations with minimal development. Thus, development has the potential to compromise the ecotourism experience of these individuals (TKC and Earthplan 2001). However, more developed facilities still have the potential to attract some eco-tourists seeking nature and culture-based activities (DLNR 2003). In addition, there are increasing concerns about sustainability and carrying capacities of ecotourism (Rodgers and Jokiel 2007). Because of their interest in remote areas, eco-tourists are also a means of passive dispersal by non-native invasive species.

#### 7.5.6 Homeless/Squatters vs. Park Visitors

Homelessness remains an issue throughout the state as a result of nation-wide economic problems, mental illnesses, and cuts in state social programs (DLNR 2003). Squatters and homeless were evicted from the Hā'ena State Park during the Taylor's Camp era in the 1970s. However, squatters still reside in various locations throughout the isolated valleys of the adjacent Nāpali Coast and can be frequently seen at the Hā'ena State Park. Beach encampments can impact the visual image of the island, restrict users' access to facilities, create sanitation problems, and contribute to park maintenance needs (DLNR 2003, Gererna-Morales 2007). The presence of these individuals can ultimately impact the tourism industry; the Hawai'i Tourism Authority has stated that tourists have commented that seeing homeless people in parks or at the beaches makes them felt uncomfortable (Gererna-Morales 2007).

#### 7.5.7 Windsurfers vs. Other Recreational Pursuits

Windsurfing has been shown to disrupt other recreational users at parks throughout the state (CSV Consultants 2007). Windsurfers often come close to others at high speeds. Beginning windsurfers often find control of their boards difficult and represent a greater risk to others in the water than expert windsurfers. In turn, park users, such as swimmers, sunbathers, snorkelers, and divers, can obstruct windsurfing zones and launching areas (CSV Consultants 2007).

At the Hā'ena State Park, Clark (1992) identifies only a “minor conflict” between windsurfers and fishermen. Throw-net fishing primarily occurs during low tides when the reefs are more exposed. Low tides often coincide with strong, consistent trade winds, which are ideal conditions for windsurfing. When these activities happen together, windsurfers can scare away schools of fish for throw net and pole fishermen (TKC and Earthplan 2001).

#### 7.5.8 ORVs vs. Beach Users

ORVs can degrade the visual appearance of the beach by damaging vegetation and sand dunes. In addition, the noise and safety hazards associated with vehicle use on the beach conflict with other beach users and can detract from visitor experiences at the park (TKC and Earthplan 2001).

#### 7.5.9 Traditional Fishing vs. Recreational Fishing

In 2006, HRS 18-22.6 designated a community based subsistence fishing area at the shoreline of the Hā'ena district “for the purpose of reaffirming and protecting fishing practices customarily and traditionally exercised for purposes of native Hawaiian subsistence, culture, and religion (SB2501). Enacted in 2007, the subsistence fishing area law was modeled after other community-based subsistence areas elsewhere in the state (e.g. Mo'omomi, Moloka'i). Because the Hā'ena area is relatively new, specific management protocols are still being discussed amongst community members (Heacock, DAR, pers. comm.). It is anticipated that the self-policing of the area as called for by the act will include protocols for recreational fishers and visitors to seek permission to fish within the area from local stewards of the resource, seasonal and take limits, limits on gear, and so forth.

The only area on the north shore of Kaua'i where nearshore marine life is protected from fishing pressure is the Kilauea Point National Wildlife Refuge managed by the U.S. Fish and Wildlife Service. This area,

along with the more remote portions of the Nāpali Coast, may serve as defacto marine preserves because of their inaccessibility.

Reef waters of Hā'ena State Park also serve as a defacto preserve during winter months when high waves and strong currents limit fishing opportunities. Preserves provide safe havens for fish development and sources of stock enhancement following periods of increased fishing pressure on adjacent areas.

#### 7.6 Impacts of Increased Recreational Uses

An increase in recreational uses at the Hā'ena State Park would place greater demands on existing facilities infrastructure, and on the physical, ecological, and societal capacity of the area (See Section 7.4). Attracting more recreational users would further increase current traffic congestion and parking issues for both visitors and residents. More users would also have the potential to impact stream and nearshore water quality by increasing the amount of non-point and point-source pollution in the area. The reef ecosystem would be significantly impacted by an increase in unregulated recreational activity at the Park. Potential impacts to the coral reef ecosystem as a result of increased recreation in the nearshore area include: decreased coral coverage, altered coral growth, decreased fish populations, reduced local biodiversity and increased propagule pressure of invasive species. Without an enforceable Park management plan, an uncontrolled increase in current recreational activities at the Hā'ena State Park would lead to further dune erosion and the removal of dune vegetation; create untenable traffic congestion and conflicts; increase the level of pollutants in non-point source stormwater runoff; conflicts between recreational and subsistence fishers, and between other and various users of the Park's marine waters; loss of the unique socio-cultural character of the Park are surrounding neighborhood; reduced level of enjoyment by visitors and residents alike; and ultimately as a ‘worst case’, the potential economic collapse of the area as a visitor destination.

#### 8.0 Design Considerations and Resource Management Concepts

##### 8.1 Water Quality Issues

Several design considerations can be assessed to help maintain Class AA coastal water quality standards at Hā'ena State Park as visitations increase. These include following actions:

- Conduct a high-resolution assessment of Park topography and evaluate alternate storm drainage features to minimize or slow runoff into the ocean
- Upgrade sanitation facilities and conduct regular inspection and maintenance of sanitation systems at the public restrooms to prevent sewage seepage or spillage into the ocean or groundwater
- Create parking areas remote from the Park and allow only pedestrian or shuttle bus access
- Carefully design parking areas and apply best management practices to prevent the runoff of contaminants to streams and coastal waters
- Conduct regular maintenance of, and apply best management practices to, the Kalalau Trail to prevent unnecessary soil erosion, siltation, high turbidity, and possible coral mortality within the Kē'e Lagoon and reef
- Provide and regularly maintain an appropriate number of trash and recycling receptacles to reduce the amount of plastic and other solid waste that blows or gets washed into the ocean in storm runoff.

##### 8.2 Shoreline Erosion

Sandy beaches are at the heart of the multi-billion dollar visitor economy in Hawai'i that provides the greatest share of the state's jobs and income. When erosion threatens the built environment a common reaction is to armor the shoreline with a seawall or revetment. Armoring may impound sand thereby

impacting the sediment budget of a beach and exacerbating the erosion. Shoreline armoring also increases wave turbulence and reflection. It is common to find that the construction of one seawall on a beach leads to proliferation of additional seawalls. Armoring a chronically eroding coast leads to beach loss (Fletcher, et al. 1997). Beach loss because of seawall construction on eroding shorelines has been estimated to be 25% on O'ahu and 20% on Maui (<http://www.surfrider.org/>). In an era of accelerating sea-level rise (Church and White 2006) the threat of chronic erosion and beach loss is growing and the use of shoreline data becomes a potentially significant coastal management tool in the effort to conserve beaches for future generations.

The Kaua'i Shoreline Erosion Management Study (DHM et al 1999) developed management recommendations and plans for selected Kaua'i shoreline areas including the area between Hā'ena and Wainiha. The recommendations developed from this and related studies for preservation and restoration of sandy beaches and setbacks to compensate for coastal erosion at the Hā'ena State Park are consistent with the policies and guidelines of HRS 205A Hawai'i Coastal Zone Management, Hawai'i Coastal Erosion Management Plan (DLNR 1997), DLNR Office of Conservation and Coastal Plans and the County of Kaua'i General Plan (2000), and Kaua'i County Council Ordinance 863: Shoreline Setback and Coastal Protection Ordinance. Erosion prevention and control actions specifically relevant to the Park include:

- Delineate and manage specific erosion prone areas by 'littoral cells'. Littoral cells are self-contained beach compartments that are geographically bounded by specific physical features (e.g. groins, piers, points of land) that either provide or remove sand from the cell.
- Establish shoreline setbacks of no less than 60 feet for Hā'ena
- Prohibit shore protection structures
- Remove unpermitted shoreline structures
- Preservation of public shorelines in natural state
- Give non-structural remedies (e.g. beach nourishment) preference over structural work
- Develop and update a shoreline structure inventory

Design of future Hā'ena State Park facilities should employ the recent data and maps developed by the University of Hawai'i (UH) Coastal Geology Group (<http://www.soest.hawaii.edu/coasts/>) to calculate appropriate setbacks.

### 8.3 Marine Resource Issues and Conservation

Coral reef ecosystems have high gross primary productivity, yet the net productivity and potential fisheries yields on coral reefs are relatively low (Birkeland 2001). Populations of fishes and invertebrates on coral reefs can be fished out quickly and if severely depleted, may not return. Coral reef species are particularly vulnerable to overfishing partly because of their life-history adaptations. Because of the life-history traits of the targeted species and because of the nature of the ecosystem processes, we must be careful about expecting too much from coral reefs. The fisheries yield of coral reefs should not be expected to keep pace with the growing human population and its demand for protein (Birkeland 2001). Overfishing also can have a deleterious impact upon ecosystem function and marine community structure. While pelagic fisheries might be managed on a species-by-species basis, coral-reef fisheries must be managed on an ecosystem basis.

Four years of CRAMP monitoring data and several independent studies of the reefs within the Park suggest the nearshore waters of Hā'ena State Park from Kē'e Beach to Hā'ena Point contain largely undisturbed coral reef resources that provide habitat for healthy populations of fishes and invertebrates of subsistence and recreational value. These populations can be sustained provided that they are actively managed through carefully organized stewardship programs. Excessive fishing pressure, particularly upon a limited number of target species, can lead to dramatic adverse changes in community structure. Serious reduction or collapse of fish resources at Hā'ena and/or significant damage to the reef habitat would reduce its overall importance as a visitor destination area and would deprive the local community

of a valuable subsistence resource (Birkeland 2001). Stepath (1999) has highlighted the potential problems associated with excessive and inappropriate uses of the Park waters.

Improvements to the Park facilities through the master planning process may consider the following measures to help protect and sustain the long-term viability of the marine environment. These considerations are adapted in part from the Coral Reef Ecosystem Fishery Management Plan (CREFMP) for the western Pacific which is the first ecosystem-based fishery management plan for U.S. waters:

- Encourage the development of management guidelines and protocols for the Community-Based Subsistence Fishery Area established for Hā'ena by Hawai'i state law within a structured administrative framework;
- Establish a permit system as part of this program that requires catch reporting to allow the evaluation of changes over time in catch per unit effort and size distribution of the resource allows management to improve (Birkeland 2001);
- Establish a program of long-term scientific monitoring of fish and invertebrate populations trends within Park marine waters;
- Allow sufficient flexibility and insure long-term monitoring to employ the principal of adaptive management and allow changes to be made to permitting processes and management actions, as deemed appropriate based upon the results of long-term monitoring and catch statistics;
- Establish a means of enforcing the permitting system for recreational fishing within the Park waters.

Consideration might also be given to the establishment of a marine protected area (MPA) adjacent to or within a portion of the Park to serve as a fishery stock replacement area.

### 8.4 Mitigation of Conflicting Uses

Community consensus is the best mechanism to achieve a lasting solution of recreational user conflicts. Establishment of a Park users-group consisting of stakeholders, local residents, and government agencies should meet to discuss ways in which the conflicting uses discussed in the previous sections can be mitigated. User group meetings can be led by an independent moderator or by an agency or non-profit group. Segregation of conflicting uses might be considered on a rotating user basis by day and/or month, or weather and sea-condition basis, permit, or other system.

### 8.5 Shoreline Access

HRS 115-4 and 115-5 provide that the public has a right of access all State beaches and shorelines situated below the "upper reaches of the wash of the waves." In general, counties have the primary authority and duty to develop and maintain public shoreline access. The State's primary role in the shoreline area is to preserve and protect coastal resources within the conservation district and support public access along and below the shoreline (HRS Chapter 205A). Because of the steep shoreline along the Nāpali Coast west of the Park, the portion of the shoreline where pedestrian access becomes feasible begins at Kē'e Beach and extends eastward along the shore to Hā'ena Point.

- Shoreline access points can be placed to control access for specific recreational and subsistence uses, and should be limited to pedestrian access.
- No public vehicular traffic should be allowed on the beach within the Park.

## 9.0 Interpretive Concepts for Marine Recreational Use

A number of community-based and non-governmental (NGO) organizations, as well as government-private and NGO partnerships support periodic monitoring and educational studies of the lagoon and reef at Hā'ena State Park. These include Windward Community College (CRAMP), Makai Watch, Save our Seas, Reef Check, The Nature Conservancy, Mālāma Hawai'i, Community Conservation Network, Hawai'i Wildlife Fund, Sea Grant Program, Hawai'i Department of Land and Natural Resources Division of Aquatic Resources. Many of these activities are in turn supported by grants from government agencies and the private sector including those from Tesoro, Harold K.L. Castle Foundation, National Fish and Wildlife Foundation, NOAA, Hawai'i Tourism Authority, and others.

The State of Hawai'i Coastal Zone Management Program (CZMP) has prepared an Ocean Resources Management Plan (ORMP), as required by Chapter 205A of Hawai'i Revised Statutes (HRS), through collaboration with government agencies and stakeholders. The ORMP draws on traditional Hawaiian ecosystem management principles, relies on community and private sector involvement, promotes an adaptive learning approach, identifies responsibilities and a schedule for implementation, and emphasizes interagency collaboration and public-private partnerships. Hā'ena is one of several ORMP stewardship sites being studied over the next five years.

Each of these organizations can be considered a stakeholder in the development of interpretive, education, and management programs for Hā'ena State Park. Following the successful model of Hanauma Bay on O'ahu, consideration should be given to the establishment of a "Friends of Hā'ena State Park" organization. Such a non-profit organization can help develop and sustain a visitor education program, coordinate park cleanups by volunteer service groups, coordinate use of the park by different marine recreation groups (e.g. dive clubs, surfing contests, kayaking, etc.), provide formal and informal docent services, assist the Hawai'i Division of State Parks with management, and help alleviate user conflicts. A service group such as this might also serve as the point-of-contact for the community-based subsistence fishing area for those wishing to shorefish or spearfish within the Park.

Educational signage, a docent program, lectures, films, and interactive kiosks are all valuable approaches to consider for enhancement of visitor and resident enjoyment of Hā'ena State Park. More information on the Hanauma Bay carrying capacity study can be found in Lankford et al (2005). Friends of Hanauma Bay website is: <http://www.friendsofhanauabay.org/history.html>.

**Cover Photos 1-12**

Hā'ena State Park cultural resources:

Mountain peaks, Kalo, Lohiau's wall,  
Ka-Ahu-A Laka, Hula Pā, Ka-Ulu-O-Paoa,  
Loko Kē'ē/Loko Naia/Marsh, Park sign, Waiakapala'e Cave,  
Kē'ē Beach/Lagoon, Limahuli Stream, Muliwai Beach

## EXECUTIVE SUMMARY

At the request of *PBR Hawai'i and Associates, Inc.* and the Division of State Parks, Department of Land and Natural Resources (DLNR), a Cultural Impact Assessment [CIA] was conducted for *Hā'ena State Park* as part of a larger project, *Hā'ena State Park Master Plan/EIS*. The purpose of this CIA was to gather information about traditional cultural practices, ethnic cultural practices and pre-historic and historic cultural resources that may be affected by the implementation of the Master Plan. The level of effort of this study included a broad cultural and historical background review; review/analysis of oral histories of six people knowledgeable about Hā'ena State Parks lands.

According to the archival material, Kaua'i has had a long history of habitation that included most of its coastal lands, with great resources in the interior lands and waterways. Kaua'i was inhabited long before the arrival of the Pele *ohana*. The famous epic saga of Pele, her sisters and brothers is where we see Lohi'au mentioned, Hā'ena's most famous resident *ali'i*. The foundation and walls of his *hale* still stand today, as does the *heiau* and *hula* platform where he worshipped and honored the *hula* goddess Laka. Ancient Menehune and Mai'a people were said to have gone back to their homeland from Hā'ena. The ancient ceremony of throwing fire brands (*ōahi*) off the mountain was performed from the top of Pu'u Makana, a prominent natural feature in Hā'ena State Park lands. There are many other stories about gods, goddesses, chiefs and chiefesses who made Hā'ena home, as well as a long tradition of *maka'āinana* who farmed its rich lands and fished in the abundant coastal waters, evidenced by burials and oral histories that have been passed down through generations.

The Hā'ena State Park lands were once part of an ancient Hawai'i *ahupua'a* life-system as well as a support system for the *ali'i* who lived there. The physical evidence of multi-use ancient or traditional cultural practices still exists near by (e.g. Lohi'au's *hale*, *hula* platform, *heiau*, *loko* or fishponds and *lo'i*), which not only indicate traditional land use of the area, but that it was/is considered *wahi pana* (sacred or significant place). They also indicate that Hā'ena was not only well established, but part of ancient Hawai'i *ahupua'a* life-systems that included the *ali'i*, officiating *kahuna* and people who lived and cared for the land. The *hale* complex of Lohi'au confirms that portions of Hā'ena were *ali'i* lands with all the infrastructure and required support systems. Fishponds or *loko* were considered resource/property of the *ali'i nui* therefore it can be assumed that Loko Kē'ē and Loko Naia were most likely under the control of and primarily for the benefit of *ali'i*.

According to several sources, there are many pre-Contact burials in the park sand dunes and in the vicinity of the comfort station; one consultant said there were burials in the *lo'i* area as well. There are several historic burials near the area of the foundation of the old poi mill. Burials were and are considered a very significant cultural practice.

Hā'ena State Park lands are located on storied lands, once part of ancient and historic communities who lived, farmed, fished, gathered, tended fishponds and buried their dead. A limited number of people were interviewed and shared their *mana'o* and many concerns regarding Hā'ena State Park; a long list of recommendations for the Hā'ena State Park Master Plan/EIS is provided based on their *mana'o*. It is also highly recommended that a cultural advisory committee or group be formed, hopefully including these interviewees, who could provide cultural expertise during the Master Plan/EIS process and during any later park development projects.

## ACKNOWLEDGEMENTS

Mahalo nui loa to all the people who agreed to take the time to be interviewed for the Master Plan/EIS in 2008 whose interviews I reviewed and analyzed for this project: Kumu Kapu Alquiza; Uncle Thomas Hashimoto; Mr. Clarence Hashimoto; Mr. Chipper Wichman; Uncle F. Bruce Wichman; and especially Mr. Randy Wichman (and his wife Victoria) for their awesome hospitality and dinner. And another *mahalo nui loa* to Randy for agreeing to a telephone interview (2009) for the comfort station project.

Mahalo to Mr. Kepā Maly for allowing me to review his reports and to the staff of PBR for providing reports of various studies conducted in Hā'ena State Park.

MAHALO NUI LOA!!!!!!

## 1.0 INTRODUCTION

At the request of *PBR Hawai`i and Associates, Inc.* and *Hawai`i State Parks*, a Cultural Impact Assessment (CIA) was conducted for *Hā`ena State Park* as part of a larger project, *Hā`ena State Park Master Plan and Environmental Impact Statement* (Job No. F74C664A). This CIA was in accordance with the State of Hawai`i Environmental Council *Guidelines for Assessing Cultural Impacts* [1997] and in compliance with Act 50 SLH 2000 (HB 28 H.D.1) (Appendix A) as it amends the State of Hawai`i Environmental Impact Statement law [Chapter 343, HRS] to include "effects on the cultural practices of the community and State. [It] also amends the definition of 'significant effect' to include adverse effects on cultural practices."

The purpose of this CIA was to gather information about traditional cultural practices, ethnic cultural practices and pre-historic and historic cultural resources that may be affected by the implementation of the development project. The *level of effort* of this study included a broad cultural and historical background review; ethnographic survey (oral histories of six people); and review/analysis of twenty-two past oral histories.

This report is organized into five parts or chapters. Chapter 1 describes the project area in terms of location, in the context of *ahupua`a*, district and island, as well as a generalized description of the natural environment [geology, fauna, flora]. Chapter 2 explains the methods and constraints of this study. Chapter 3 summarizes the review of the traditional and historical literature in the context of the general history of Hawai`i, the island of Kaua`i and the local history of Hā`ena Ahupua`a (Figure 1). Chapter 4 presents the analysis of the ethnographic survey as it pertains to land, water, marine and cultural resources and use in the project area and vicinity. Chapter 5 summarizes the findings of this cultural impact assessment, which is based on the archival and ethnographic research data.

### 1.1.0 SCOPE OF WORK

The scope-of-work (SOW) [Appendix B] was based on the recommendations in the Environmental Council *Guidelines for Assessing Cultural Impacts* (1997) [Appendix C] and focuses on three cultural resource areas (traditional, historical and archaeological), conducted on two levels: archival research (literature review) and ethnographic survey (oral histories).

The research for this cultural impact assessment (CIA) was conducted within the broader context of the *ahupua`a* (traditional land division) and *moku* (traditional district), as well as the history of the agriculture, fishing and other industries in the area. The *level of effort* of this study included six interviews (oral history) and a broad literature review that included a review and analysis of twenty-two past oral histories.

Research on traditional resources entailed a review of the literature of Hawaiian *mo`olelo* or stories/legends, late nineteenth and early twentieth century ethnographic works and interviews with people who were knowledgeable about the area.

Historic research focused on Land Commission Awards (LCA) and archival material from the following: University of Hawai`i-Manoa Hamilton Library-Hawaiian Collections; Kaua`i Museum Archives; DLNR State Parks reports; reports provided by PBR-Hawai`i (on-line); Internet searches and personal library. Archaeological research entailed a review of reports provided by DLNR State Parks staff.

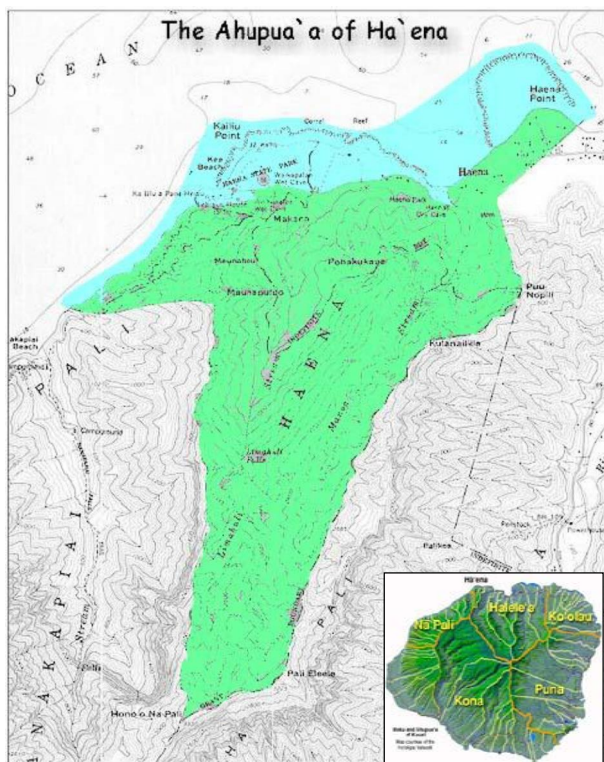

Figure 1. Ahupua'a of Hā'ena and Kaua'i Moku (Pacific Worlds/Stokes 1995)

## 1.2.0 PROJECT AREA

The project area is comprised of 64 acres within the park boundaries, the adjacent near-shore waters and Ke'e Beach, TMK 5-9-01:22 (por.) and TMK 5-9-08:1. Within the park area, parcel 25 of TMK: 5-9-01 owned by the County of Kaua'i (County) and includes Ka Ulu O Paoa Heiau and Ke Ahu A Laka (Hula Platform) and managed by the State Historic Preservation Division (SHPD). The project area also includes the State Department of Transportation highway within the park area.

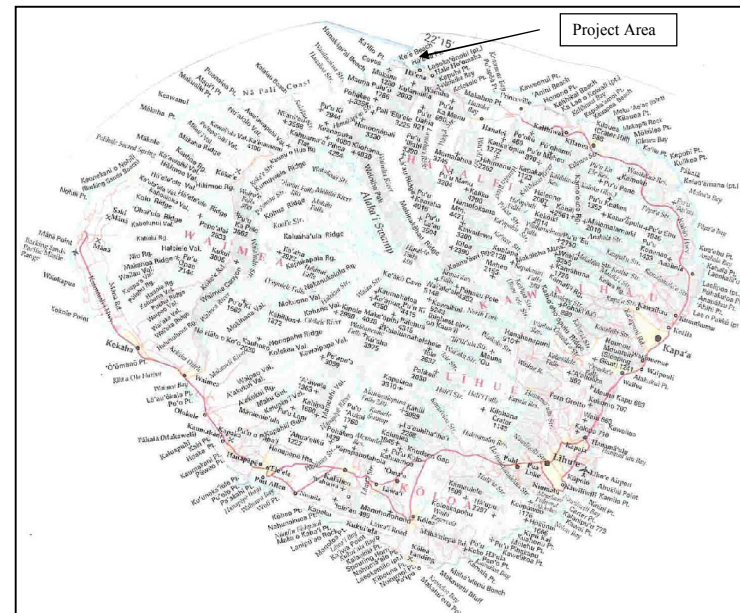

Figure 2. Map of Kaua'i. (adapted from Juvik & Juvik 1998:5).

## 1.2.1 PROJECT LOCATION

The park boundaries are defined by the Limahuli Stream on the east, the ocean on the north and west boundaries and cliffs on the south boundary. The majority of the park is below 40 feet above sea level, however, portions of the park area that are against the cliffs can be as high as 400 feet above sea level. The Kūhiō Highway (former Government Road and only access) runs east-west, bisects the park and terminates at Kē'e Beach. Natural features within the park include two wet caves (Waiakapala'e and Waiakanaloa) *ma uka* (mountain) side of the road, and a well defined sand dune. The *ma kai* (ocean) side of the road contains large areas of remnant irrigated taro terraces from pre-contact era through the 1960s - currently being revived - and mixed (introduced and alien) vegetation; portions of this area are marsh or wetlands with sections once former fishponds (now overgrown). Other cultural features within the park proper include remnants of Lōhi'au's house, the *hula* platform and *heiau*, and several burials within the sand dunes. Developed areas within the park included a newly constructed restroom facility that includes a shower system; two unimproved parking areas, the Kalalau trail, remnants of the former Brown/Allerton estate, which includes a caretaker's house, remnants of a mill and several historic burials. The majority of the park use includes Kē'e Beach and fringing reef (see Figure 1), the Kalalau trail, the beach trail through the Allerton estate, access to the *hula* platform (owned by Kaua'i County), the restored taro *lo'i* (pond fields) and access to fishing areas (TKC 2001:1-4).

The following is from the “Hā’ena State Park Master Plan and Draft Environmental Impact Statement” prepared by The Keith Companies –Hawai’i, Inc. (TKC) and Earthplan Planning and Design (July 2001).

The significance of Hā’ena State Park on a statewide scale relates to the cultural, historical, religious and recreational resources found within the park and beyond. From a cultural standpoint the Hā’ena State Park is unique in the sense of containing a large, complete, intact, Hawaiian cultural unit/complex in the regional context of the Hā’ena - Nāpali Coast, including sites associated with agriculture and marine subsistence, religion and habitation. It was a significant gathering place for early Native Hawaiians and continues to be so. The statewide (and national) significance of this Hā’ena Archaeological Complex is confirmed by its inclusion on the State and National register of Historic Sites. Interpretation of these features can offer a valuable educational tool that will enlighten visitors and the community alike of the early Native Hawaiian lifestyle (TKC 2001:I-1).

The Hā’ena State Park is a very significant feature as related to the island of Kaua’i. Located at the extreme northwestern end of the coastal beltroad highway system (Kūhiō Highway). Hā’ena State Park is, for many of the visitors to the island, one of the primary destinations. As is the case with its statewide significance, the Hā’ena State Park is significant island wide for its cultural, historical, religious and recreational resources. Historical features located within the park create a sense of island pride in its Hawaiian heritage value, especially for the North Shore community, whose *hula halau* continues to assist in the maintenance and care of the *hula* platform in exchange for use of the site (TKC 2001:I-2).

### 1.3.0 ENVIRONMENT

The Hawaiian Islands are geographically extremely isolated – 2,000 miles from North America and 1,000 miles from the nearest Pacific atoll. However, an impressive number of native plants, invertebrates and birds reached these islands by natural means (long-distance dispersal: direct, windborne, or waterborne) thousands of years before any human introductions (Juvik & Juvik 1998:103 -104).

According to the Kaua’i ecosystem map (Juvik & Juvik 1998:122 -123), the native ecosystems of the project area consisted of lowland dry and mesic forest, woodland and shrubland (terrestrial) and sandy beaches and major fringing reefs (marine). Today, the project area has been greatly transformed by human activity with trace remaining native ecosystem that consists of wet forest/woodland and lowland dry and mesic forest, woodland and shrubland.

#### 1.3.1 Terrestrial Ecosystems in Hā’ena State Park

##### 1.3.1.1 Native Wet Forest and Woodland (Juvik & Juvik 1998:126-127):

Climate/Substrate. Annual rainfall 80-<400 inches without regular dry periods; temperatures warm at low elevation, cool in montane areas. Substrates- very weathered soils on older islands.

Biota. Vegetation – closed-canopy forests of *‘ōhi’a*, sometimes with *koa* or *‘ōlapa* codominant; open-canopy forests or woodlands of *‘ōhi’a* and *uluhe*. Forests of *hala* in coastal lowlands; shrublands of *‘ōhi’a* and ferns; also *‘ākala* and shrublands.

Biota. Fauna – primary habitat of most extant Hawaiian honeycreepers and other forest birds: *‘apapane* most common; great diversity of native invertebrates.

Endangered Species: more than 50 plant species including lobeliads, *ha’iwale*, endemic mints and ferns (*kīhi*). Birds including *‘ō’ū* and *‘ākohekohe*.

Cultural Significance: traditional realm of Hawaiian gods (*wao akua*); not for casual human visitation. Source of plants for fiber (*‘olonā*); weaving (*‘ie’ie*), clothing (*kapa* from *wauke*), medicines and construction woods. It is also primary zone for bird collection for feather work.

Threats. Feral pigs, feral cats, black and Polynesian rats; alien slugs; introduced plants; clearing for agriculture and grazing; and suburbanization.

##### 1.3.1.2 Lowland Dry and Mesic Forest, Woodland and Shrubland (Juvik & Juvik 1998: 127):

Climate/Substrate. Annual rainfall 20-80 inches; warm to hot with seasonal drought. Soils less weathered than in wet forest.

Biota. Vegetation – plains, lower slopes, dry ridge tops and cliffs support grasslands of *pili* or *kāwele*. Dry or mesic shrublands of *‘a’ali’i*, *‘ākia*, *ko’oko’olau*, *‘ūlei*, and other shrubs. Dry forests of *‘ōhi’a*, *koa*, *lama*, *wiliwili* and rarer trees on ridges, rocky slopes and leeward gulches. Mesic forests (now rare) of *‘ōhi’a*, *koa* or *lama* and rarely *olopua* or *halapepe* occur in gulches and on lower slopes and less disturbed sites.

Biota. Fauna – native birds (*‘elepaio*, *‘apapane* and *‘amakihi*); native insects now depleted.

Endangered Species. Many trees and shrubs including *koki’o* and Kaua’i *hau kuahiki*; Hawaiian hoary bat greatest abundance in this zone.

Cultural Significance. Forested zone was the realm of Hawaiian gods, especially Kū. Sandalwood exploitation of the early 1880s occurred in lowland mesic forests. *Pili* grasslands, a source of thatch material maintained by fire; medicinal plants and hardwoods were gathered. Some mesic areas were converted from forest to dryland *kalo* and *‘uala* agriculture.

Threats. Feral goats, feral cats, rats, alien invertebrates, especially ants; invasive alien plants. Many lowland areas were burned and cleared in ancient Hawaiian times; today urbanization and development continue.

##### 1.3.1.3 Coastal Communities (Juvik & Juvik 1998:128-129):

Climate/Substrate. Warm; windward shores receive up to 120 inches annual rainfall; strong winds typical. Substrates include raised coral, basalt cliffs, sandy beaches, basalt and coral boulders, and littoral cones or tuff.

Biota. Vegetation – greatly influenced by proximity to ocean; many salt-tolerant species. Dwarf shrublands of *‘naupaka-kahakai* most common, *‘ilima*, *naio*, *hinahina* (uncommon), *‘ākulikuli*, *‘aki’aki* grass, or sedge. Coastal forest of *hala* in a few windward sites; wetlands of native sedge now rare.

Biota. Fauna – threatened green sea turtle (*honu lū’au*); shorebirds such as wandering tattler (*‘ulili*) and ruddy turnstone (*‘akekeke*) common in winter.

Endangered Species. Hawaiian monk seal, hawksbill turtle very rare; black-necked stilt (*ae’ō*) and Hawaiian coot (*‘alae ke’oke’o*) depend on remaining wetlands. Plants include *‘ōhai* and dwarf *naupaka*.

Cultural Significance. Coastal areas, the most densely populated lands in ancient times, continue to be important in traditional Hawaiian culture, providing medicines, *lei* materials and other resources.

### 1.3.2 Marine Ecosystems in Project Area

#### 1.3.2.1 Sandy Beaches (Juvik & Juvik 1998: 113-114):

White sand is primarily from the breakdown of coralline algae and corals. Wave action and biological and chemical erosion determine composition and longevity of beaches. Offshore sand reservoirs connected to beaches often undergo seasonal cycles of erosion, accretion and alongshore drift.

Biota. Vegetation— beach morning glory (*koali*), beach heliotrope, milo and *hau*.

Biota. Fauna — ghost crabs, mitre and auger shells, seabirds, threatened green sea turtle, endangered hawksbill sea turtle, and endangered monk seal use beaches for resting and nesting.

Cultural Significance. Hawaiians used beaches for burials (cemeteries), canoe launch sites and recreational, subsistence and ceremonial purposes. Beach sand and waterworn pebbles were used in the floors of Hawaiian houses.

Threats. Sand mining degradation by trash, beach erosion caused by shoreline fortifications.

[On the sandy areas along the coastal plain sweet potatoes [ *'uala* ] were grown. Formerly many varieties of banana [*mai'a*] were planted in Limahuli and Mānoa Valleys, as well as many kinds of sugar cane [*ko*] and several varieties of *'awa*...and while cultivation of coconut (*niu*) was limited in Hawai'i due to its northerly latitude, on Kaua'i 'the favored places' included Hā'ena and Hanalei (Handy in Pacific Worlds).]

#### 1.3.2.2 Rocky Beaches (Juvik & Juvik 1998:114):

Shorelines where sand and other sediments are absent due to constant wave action, currents, steep submarine slopes and lack of offshore sand reservoirs.

Conditions/Substrates. Mostly consolidated basalt, but sometimes consolidated limestone (cemented beach rock or raised coral reefs).

Biota. Vegetation— sea lettuce, Sargasso or various algae.

Biota. Fauna — Limpet, periwinkles, littorine snails, rock crabs, gastropods and rock urchin; offshore waters are possible feeding areas for threatened green turtle.

Cultural Significance. Rocky beaches often were important fishing grounds and canoe launching sites for Hawaiians.

Threats. Coastal, urban, resort development.

#### 1.3.2.3 Estuaries (Juvik & Juvik 1998:114-115):

Distribution. Places where fresh and marine waters meet at the coastline (stream mouth).

Conditions/Substrates. Freshwater flowing into the ocean floats on the sea surface because of its lower salt content and density.

Biota. Vegetation— marshes...some seaweeds.

Biota. Fauna — crabs, shrimps, mullets, endemic flagtails, *āholehole*, anchovies, small jacks, barracudas, eels, shorebirds, waterbirds,

Cultural Significance. Sources of fresh water and fish for Hawaiian communities in the past.

Threats. Modification for settlements; pollution by sewage and other discharges.

#### 1.3.2.4 Fringing Reefs (Juvik & Juvik 1998:117-118) (see also Figure 1):

Distribution. These reefs grow, terrace-like, off island shores, with their outer slopes extending to depths of about 165 feet.

Conditions/Substrates. Calcium carbonate skeletons and sediments produced by corals and coralline algae comprise the bulk of reefs. Sand deposits and seaweed common on shallow inner reef flats; living corals and coralline algae predominate at reefs outer edge; deeper slopes are mostly dominated by live corals or old reef rock. Beneath living outer layer of reef organisms, remains of previous reef builders are compacted and cemented into a hard, limestone, wave resistant structure which may be cut through by channels.

Biota. Threatened green sea turtle forage on reef flats; endangered hawksbill turtle feeds where sponges are common.

Cultural Significance. Fishpond development and intensive fishing occurred on reef flats.

Threats. Coastal construction, erosion, sewage discharges, overharvesting of fish, freshwater flooding.

### 1.4.0 MARSH-WETLAND ENVIRONMENT

Loko (fishpond) Kē'ē, Waiakapala'e Marsh - also called Hā'ena Marsh - is a small fresh water marsh located across Kūhiō Highway from Waiakapala'e Wet Cave. The wetlands appear and disappear depending on precipitation and marsh conditions and probably occur due to heavy rainfall and high water. During wetter years, grass encroached to the wetland and left only a small pooling of water, which is shallow and stagnant. While a dry streambed inlet empties into the northeast corner, there is no perennial stream or river that feeds the marsh and does not appear to be connected to the ocean (TKC 2001:II -33).

Photo 13. Loko Kē'ē or Waiakapala'e Marsh.

## 1.5.0 GEOLOGY

The island of Kauaʻi is a single shield volcano, 552 square miles and the oldest (5.6 million years) of the major Hawaiian Islands. The highly eroded island has spectacular land forms. Landslides have modified the island's north, northeast and possibly east flanks (Juvik & Juvik 1998:41).

The lava flows that produced the majority of this volcano are collectively known as the Nāpali Formation, which is the earliest phase of the Waimea Canyon volcanic series. Later eruptions filled a central caldera...but the Nā Pali coast and Hāʻena State Park area were protected from these later flows by the caldera rim. The Nā Pali coast and Hāʻena State Park area have therefore been subject to tropical weathering and erosion since their initial formation of Kauaʻi.... The prolonged erosion has created the dramatic sea cliffs, knife-like ridges and valleys along this portion of the coastline. The Hāʻena *ahupuaʻa*, which is situated in the Hanalei district at the extreme northeastern end of Nā Pali coast, is backed by high former sea cliffs, which have been cut by two small stream valleys, Mānoa and Limahuli. Portions of the western side of the Limahuli Valley fall within the Hāʻena State Park. The dry cave near the Hāʻena County Park and the two wet caves within Hāʻena State Park are former sea caves carved by wave action. The narrow coastal flat between the cliffs and the beach is the result of alluvial deposition. This alluvial flat is fronted by calcareous beaches and a sand dune system that extends from Kēʻē Beach eastward to Wainiha Bay. The majority of the park falls on this alluvial deposition and encompasses portions of the dune system. Boulder beaches exist along the west side of Kēʻē Beach and the mouth of Limahuli Stream. Offshore is a fringing reef (TKC 2001:13).

Calcareous sand beaches are beautifully developed on Kauaʻi with the largest between Hāʻena and Lumahai and at Hanalei Bay. Sand is cemented into "beach rock" at places such as Ka Lae o ka ʻĪlio near Hāʻena and contains enough olivine to give it a greenish color (Macdonald et al 1983:470). The Hāʻena dune site estimated (1200-1860AD) (Juvik & Juvik 1998:166-map).

According to Quinn (2010:1) the current view of Kauaʻi geology is as follows:

Current thinking is that a probable second large shield volcano built the eastern part of the island and slipped down to create the expansive Lihue basin and the windward facing scarp of Mt. Waiʻaleʻale. *Kauaʻi Geologic History, A Simplified Guide*, by Chuck Blay and Robert Sievers represents an alternate view of the island's geologic history. Alluvial deposits are silts and clay, not sand. Hāʻena is a coastal plain and covering of alluvial deposits over basalt substrate behind the dune. Biogenic reefs, comprised mainly of coral and coralline algae, have grown like a "fringe" around the island. These reefs have provided skeletal matter for fragmentation, transport and deposition at the shoreline to produce sandy beaches.

Photo 14. Introduced species around the wetland area

## 1.6.0 FLORA

Hāʻena State Park is dominated by introduced species that include 218 flowering plants and nine species of pteridophytes; eleven were Polynesian-introduced species, nine are endemic, fifteen are indigenous to Hawaiʻi and four are possibly indigenous. Many of the introduced species are ornamentals (TKC 2001:11-34).

### 1.6.1 Wetland Community

During wet periods, land surrounding Waikapalaʻe Marsh is covered with a dense growth of *hau*, guava and *koa haole*. A small patch of *ape* or arrowhead, a close relative of taro and a food of early Hawaiians, still remains in the wettest, northeast corner. A *hau* thicket borders the wetland to the north, east and west. During the dryer periods, the marsh was observed to be covered with a dense hummocky, two feet high growth of *hono hono* grass. The *ape* still occupied the northeastern corner, *Halo* grass covered the western tip and a *hau* thicket still bordered the north, east and west (TKC 2001:11-34).

### 1.6.2 Strand Community

The strand, defined as the zone seaward of the tree line at Hāʻena State Park, does not have much growth...it consists mostly of *pōhuehue*, *kūkaʻipuaʻa*, fireweed, sow thistle, narrow-leaved plantain and seedlings of ironwood and false *kamani*. Beach *naupaka* occurs uncommonly. Few other species are found in this community (TKC 2001:34).

### 1.6.3 Beach Forest Community

The Hāʻena State Park coastline, especially in sandy areas...consists of false *kamani* and ironwood trees, 30 to 40 feet tall with occasional Java plum inland. The canopy cover is typically 100%, the understory is generally open and dense shade and needles preclude the development of any significant ground cover.... Understory species include veldia, pothos, four o'clock and sow thistle (TKC 2001:11-34).

### 1.6.4 Java Plum Forest Community

The Java plum forest is one of the two largest plant communities in Hāʻena State Park. It is found along Limahuli Stream occupying abandoned taro terraces, along the dirt road near the restroom facilities and on the talus along the *mauka* side of Kūhiō Highway between Waikanaloa wet cave and the rock shelter. Typically the forest consists of Java plum trees at least 30 feet tall with 50-100% canopy cover.... The density and composition of the understory vary considerably (e.g. Java plum saplings, guava, Boston fern, Christmas berry, basket grass).... Near Limahuli Stream, numerous ornamental species are found. Several are remnants of old plantings; others have become widespread such as gingers, spiral flag and marica (TKC 2001:11-34).

### 1.6.5 Mixed Forest Community

The mixed forest is the second largest vegetation type and is located in the central portion of Hāʻena State Park, *makai* of Kūhiō Highway, at the west end along the Kalalau Trail and Lohiʻau's House and on the east side along Limahuli Stream *mauka* of Kūhiō Highway...it consists of groves of *hau*, Java plum and *kukui*, mango, African tulip, octopus tree, *hala* and strawberry guava.... The Kalalau Trail portion consists largely of *hala*, *kukui*, Java plum, octopus tree and guava that are overgrown with yellow water lemon, *taro* and pothos vines [other species include rose apple, cinnamon, *lauaʻe*, *ʻawapuhi-kuahiwi* and *ti*] (TKC 2001:11-35).

### 1.6.6 Ancient Taro Beds

There are taro beds along the trail from Hā'ena to Kalalau valley which must have been cultivated by the people living at one of the two places (Bennet 1931:9).

### 1.7.0 FAUNA

In almost all of the elevation zones of the Hawaiian Islands, alien animals such as feral pigs, goats, cattle and horses have damaged native vegetation. Terrestrial fauna in pre-colonized Hawai'i consisted of only one endemic mammal, the hoary bat (*Lasiurus cinereus*), thousands of endemic insects [i.e., damselflies (*Ischnura ramburii* and *Ischnura posita*) found around reservoirs and streams], and about 100 species of endemic birds such as the Hawaiian owl (pueo) and Hawaiian honeycreeper (*Drepanididae spp*) (Berger, 1972:7, Kirch, 1985:28). Early Polynesians introduced animals included the Southeast Asian pig (*Sus scrofa*), jungle fowl or chicken (*Gallus gallus*), dog (*canis j. familiaris*), and the Polynesian rat (*Rattus exulans*). Photo 15. Wild chickens in Park

### 1.7.1 Stream Fauna

Nineteen species of macro fauna were found in Limahuli Stream...and include ten insects, three crustaceans and five fishes. Of the nineteen, eleven are native to Hawai'i, with ten of those being endemic or occurring naturally only in Hawai'i. Three of these endemic (*opae-kala'ole*, *'o'opu-nākea* and *'o'opu-nōpili*) are of some economic importance. Two endemic species (*'o'opu-nakea* and *'o'opu-nōpili*) are listed as "threatened" and of special concern. The *'o'opu-nakea* is diadromous, meaning it is migratory between fresh and salt water and it is probable that all gobies (*'o'opu*) are [endangered]. Of the alien species, the Tahitian prawn is harvested for food. In checking with the Limahuli Gardens, no other exotic species are apparent (TKC 2001:II-31).

### 1.7.2 Marsh Fauna

Bullfrogs have been heard in the marsh, however, no fish were observed.... Small numbers of Spotted Munia, Common Myna, Spotted and Barred Dove have been seen at Hā'ena Marsh. Other exotic birds (Northern Cardinal, Shama, Japanese White-eye, House Finch) are common in adjacent forested habitat. White-tailed Tropicbirds were seen in the area, though their presence bears no relationship to the wetland. No other waterbirds have been observed and there are no records of wetland birds at Hā'ena Marsh, however, because of proximity to the ocean, it is possible that all five resident native species of waterbirds and the Cattle Egret are temporary visitors (TKC 2001: II-33).

### 1.7.3 Park Wildlife

**Goats** Feral goats live in herds primarily on the cliffs of the Nā Pali Coast. Because of the proximity of the Nā Pali Coast to Hā'ena State Park, there is the possibility that goats frequent the park, especially the rugged western portion surrounding the *heiau* and the *mauka* cliff areas...[however] there are no records or evidence of goats in Hā'ena State Park (TKC 2001:II-41).

**Pigs** Although there is a large population of feral pigs on the island, no feral pigs have been sighted in Hā'ena State Park...[but] feral pigs have been observed along the beginning of the Kalalau Trail, with the only access to that area being through the Park (TKC 2001:II-41).

**Bats** Kaua'i's only endemic land mammal is the Hoary bat (*Lasiurus cinereus semotusi*). According to the DLNR-DoFAW, the hoary bat was added to the Federally endangered species list over thirty years ago.... They frequent all low lying coastal areas and DLNR - DoFAW

confirmed that they dwell in caves and treetops of Hā'ena State Park. It is recommended by DLNR-DoFAW that mass clearing of the park be avoided and that forested areas be maintained to preserve the bat habitat (TKC 2001:II-42).

**Birds** The DLNR-DoFAW confirms that there are no native, resident forest birds below 2000 feet because of avian diseases carried by mosquitoes.... Gallinule and the Koloa Duck have been sighted by DLNR-DoFAW in the Hā'ena State Park.... The indigenous Hawaiian Short-eared Owl (*pueo*) and Black-crowned night heron (*'auku'u*) are present along the coast; the latter is also found along the major streams (TKC 2001:II-42).

## 2.0 METHODS

The Hā'ena State Park Cultural Impact Study/Assessment was conducted between the months of September 2008 to April 2009. The study consisted of three phases: (1) cultural and historical archival research (limited literature review); (2) ethnographic survey (oral history interviews/questionnaires), transcribing interviews, analysis of ethnographic data; and (3) report writing.

### 2.1.0 Personnel

The personnel consisted of (1) the principal investigator -author- ethnographer who has a Masters degree in Anthropology, with a graduate curriculum (archaeology track) that included anthropology theory, cultural resource management, ethnographic research methods, and public archaeology; an undergraduate curriculum background (archaeology track) that included Hawaiian History, Hawaiian Language, Hawaiian Archaeology, Pacific Islands Religion, Pacific Islands Archaeology, Cultural Anthropology, as well as Geology and Tropical Plant Botany; and ethnographic field experience that includes over 300 interviews to date; and (2) subs, transcribers Carol Kalahiki and Dot Uchima.

### 2.2.0 Level of Effort

The level of effort for this CIS/A project was an ethnographic survey that consisted of 5-7 interviews and questionnaires; and a broad archival research primarily based on reports of previous studies and limited primary source research in Kaua'i Museum Archives.

### 2.3.0 Theoretical approach

This study is loosely based on *Grounded Theory*, a qualitative research approach in which "raw data" [transcripts and literature] are analyzed for concepts, categories and propositions. Conceptual labels or codes are generated by topic indicators [i.e., agriculture, flora, burials, fishing]. Categories are generated in a similar manner by forming groupings such as "Land Resources & Use," "Marine Resources & Use" or "Cultural Resources & Use." Since this was a semi-focused study, categories were pre-selected as part of the overall research design. However, it is not always the case that these research categories are supported in the data. In the *Grounded Theory* approach, theories about the social process are developed from the data analysis and interpretation process (Haig 1995; Pandit 1996). This step was not part of this cultural impact assessment as the research sample was too small.

### 2.4.0 Archival Research

It took several weeks of intermittent archival research and reviewing archival material compiled by *Hawai'i State Parks* staff. The majority of the archival research [primary and secondary sources] came from the Kaua'i Museum Archives, State Historic Preservation Division library; State Parks collections, personal library; and Internet searches. Most of the secondary source material included translations of 19<sup>th</sup> century ethnographic works, historical texts, archaeological reports, and Hawaiian language resources [i.e., proverbs, place names and dictionary].

### 2.5.0 Ethnographic Consultant (Interviewee) Selection

The selection of the consultants was based on the following criteria (explained further in Chapter 4):

- ❖ Had/has Ties to Project Location (including lineal descendant)
- ❖ Known Hawaiian Cultural Resource Person
- ❖ Referred by *Hā'ena State Park* Staff
- ❖ Referred by NTBG-Limahuli staff

### 2.6.0 Ethnographic Questionnaires

An ethnographic survey form/questionnaire was developed to accommodate the people who wanted to share information about Hā'ena and vicinity, but who were not slated to be interviewed due to time constraints or other limitations. This form was either mailed to people of "standing" or who expressed an interest in sharing information or distributed at public information meetings. Only two people filled out the questionnaire and mailed it back (insufficient information).

### 2.7.0 Ethnographic Interview Process

The interview process included a brief verbal overview of the study. Then the ethnographic consultant was provided with an informed consent or agreement to participate form to review, which was drafted for the edification and protection of each consultant (Appendix D). An ethnographic research instrument (Appendix E) was designed to facilitate the interview, a semi-structured and open-ended method of questioning based on the person's answers to questions ('talk-story' style). Each interview was conducted at the convenience (date, place and time) of each consultant. A *makana* or gift was given to each consultant in keeping with traditional reciprocal protocol.

### 2.8.0 Interview Procedures

Interviews were conducted at Limahuli Hale (1), home (3), or work office (1) at the request of the consultants, using an audio-cassette tape recorder. Notes were also taken as needed, but more attention was given to listening intently to each consultant.

### 2.9.0 Transcribing/Review Process

The taped interviews were transcribed by hired transcribers using a Sony Dictator Transcriber (BM-87DST) and later edited by the author. Most consultants were emailed a copy of the edited interview transcripts along with a *mahalo* letter that explained the transcript review process, along with a self-addressed, stamped envelope for return of the revised transcripts; one was mailed although the consultant said there was no need to mail copy. This allowed for corrections (i.e., spelling of names, places), as well as a chance to delete any part of the information if so desired. Consultants were also given a "Release" form (Appendix F) to sign when they were satisfied with the transcript information/revisions. One emailed permission to use information without revisions; no one else submitted any release forms.

### 2.10.0 Ethnographic Analysis Process

The analysis process followed a more traditional method, as a qualitative analysis software program was not necessary. The interview was manually coded for research thematic indicators or categories (i.e., personal information; land, marine and cultural resources and use; site information -traditional and/or historical; and anecdotal stories). For the purpose of this study, it was also not necessary to go beyond the first level of content and thematic analysis, as this was a more focused study. However, sub-themes or sub-categories were developed from the content or threads of each interview [i.e., agriculture, fishing, hula].

### 2.11.0 Research Problems

Coordinating people's schedules for interviews was cumbersome. Coordinating tasks was also a problem. However, the primary problems were people not following through with scheduled interviews, and not returning phone calls and emails.

### 3.0 CULTURAL and HISTORICAL BACKGROUND REVIEW

The Cultural and Historical Background Review entailed a broad search of primary and secondary source literature over time. The majority of the research material for this section came from the State Historic Preservation Division library, Bishop Museum archives; Hawaiian Collections of the University of Hawai'i Hamilton Library (Manoa Campus) and the author's private library. Primary source material included maps, visitor journals, genealogies and other studies. Secondary source material included translations of 19<sup>th</sup> century ethnographic works, historical texts, indexes, archaeological reports, and Hawaiian language resources (i.e., proverbs, place names and Hawaiian language dictionary). A review of the archival material is presented in this section within the chronological context of the broader history of Greater Hawai'i, the *moku 'āina* (island) of Kaua'i and the Hā'ena District. This context will illustrate that Hā'ena was not only a part of the dynamics of Kaua'i, but of greater Hawai'i as well.

#### 3.1.0 Models of Hawaiian Chronology

Models of Hawaiian Chronology such as Cordy (1974/1996), Hommon (1976/1986) or Kirch (1985) provide a temporal view of settlement patterns as well as cultural changes through time, from initial settlement through first recorded contact with the western world. Cordy's (1974) first model of a cultural development sequence looked at Initial Settlement Period, New Adaptation Period and a Complex Chiefdom Period. He has since modified this model (1996). Hommon's (1976) model of sociopolitical development sequence included four phases: Phase I AD 500 -1400; Phase II AD 1400 -1550; Phase III AD 1550-1650; and Phase IV AD 1650 -1778. This model was later modified (1986) to three phases: Phase I AD 400 -1400 Exploration and Settlement; Phase II AD 1400 -1600 Expansion; and Phase III AD 1600-1778 Consolidation. Kirch (1985) believed that initial settlement occurred much earlier than AD 600. His cultural -historical sequence model has four phases: Phase I Colonization Period (AD 300 -600); Phase II Developmental Period (AD 600 -1100); Phase III Expansion Period (AD 1100-1650); and Phase IV Proto-Historic Period (AD 1650-1795) (Kirch, 1985:296-308; Kolb, 1991:205).

For this cultural impact study/assessment, Kirch's (1985) model will be used with the following additions: Early Historic Period (AD 1795 -1899), Territorial History (AD 1900 -1949), and Modern Historic Period (post AD 1950). The reasoning behind Kirch's model is the belief of many aboriginal Hawaiian people that based on oral histories or legends, the migrations of their Polynesian ancestors to Hawai'i took place prior to 700 AD. According to Fornander (1917: IV: II: 406), there are seventy -five generations from Wakea to Kamehameha I who was born around 1753 AD. If just eighteen years were allotted to each generation (typically a generation is twenty years) that would make the time of Hawaiian progenitors Wakea and Papa Haumea (who settled in Nu'uano, O'ahu) approximately 403 AD. [McKinzie (1983:12) gives thirty years per generation.] Yent's (1980) settlement phase for Hā'ena will also be referenced (In Dye 2002:5).

It should be noted that a study by Tuggle & Spriggs (2001) refutes the 'early colonization' supposition. For decades, the consensus among Hawaiian archaeologists was that evidence from Bellows, O'ahu and Ka'i'i, Hawai'i Island, supported early Polynesian colonization dates of AD 300 to AD 600 (Tuggle 1979; Kirch 1985). However, Tuggle and Spriggs (2001) have since studied new data and re-evaluated past dates and dating methods and have concluded that acceptable early dates fall within 700 -1100 AD. These dates appear to coincide with data that eastern Polynesia was settled much later than previously thought (Rolett 1989).

The following overview encapsulates cultural changes over time and highlights significant events and people. More corroborating details follow this overview section with traditional *mo'olelo*, *mele*, *oli*, historic works and various studies.

### 3.2.0 An Overview of Human Impact, Settlement and Socio-economic Development of Kaua'i in the context of Greater Hawai'i

#### 3.2.1 Colonization Period (300-600 AD)

First voyager dating is scanty at best, however, based on early site dates from Bellows, O'ahu and South Point, Hawai'i, Kirch (1985) estimated that the Colonization Period of the Hawaiian Islands was somewhere between 300 -600AD. These first Polynesian voyagers to Hawai'i followed the tracks of migratory birds. They traveled mainly by the stars on a voyage of migration; sixty to a hundred persons could exist for weeks on a large canoe, which could have been a hundred feet in length (Day 1992:3). This feat was "remarkable in that it was done in canoes carved with tools of stone, bone, and coral; lashed with handmade fiber; and navigated without instruments" (Henry 1995: vii).

Reconstructing the cultural sequence for the district of Hā'ena, Kaua'i and greater Hawai'i during the colonization period would involve the 'founder effect' and time necessary to adjust and adapt to a new environment. The colonizers were not able to bring all of the gene pool or cultigens from their homeland, so their new culture consisted of what survived the journey, what was remembered and what could be applied to the new environment (Kirch 1985:285 -6). Although early Hawaiians were farmers and felt spiritually tied to the 'aina (land) in many ways (Waters, n.d.), when they first arrived they had to modify both their subsistence practices and the land. Faunal remains analyses indicate that early Hawaiian subsistence depended on fishing, gathering, bird hunting (extinct fossil remains, see Olson and James, 1982), as it took time to clear the forests, plant their crops, breed their animals, and construct suitable living quarters.

According to Wichman (2003), Kaua'i was first settled by descendants of Kumuhonua and Lalo-honua - thirty-six generations before Papa was born (Wichman 2003:2) - during the time of Papa and Wakea (second son of Kahiko and Kū-pūlana-kehau) (Wichman 2003:4) who came well before the descendants of Nana'ulu came to Kaua'i. Wichman's genealogies (2003:117-131) are used as approximate/guiding dates in this report.

Ho'ohoku-i-kalani [daughter of Papa and Wakea (ca A.D. 530)] gave birth to another son [from Wakea] whom they named Hāloa after his dead brother. From Hāloa, it is said, descend all the Polynesians. Kaua'i historians claim that a younger brother of Hāloa discovered and settled on this island. This was Chief Ka-māwae-lua-lani-moku [ca A.D. 555], who traveled to this island with his wife, Kahiki-lau-lani, and her two paddlers Kō-nihinihi and Kō-nahenahe. Because of his good deeds, the great number of his descendants, and the prosperity of his reign, people began to call this island Kau-a-i (*Place of Abundance*).... Whether Ka-māwae-lua-lani-moku and Kahiki-lau-lani ever lived on Kaua'i is unknown. It is more certain that one day, not too many generations after Papa and well before the descendants of Nana'ulu came to Kaua'i, a voyaging canoe commanded by Kū'alu-nui-kini-akua approached the island from the west. Nothing is known of him except his name and that he had a counselor named Pi'i -'ali'i. The genealogy of the first Kaua'i settlers is broken, for they lost their lands and identity after a long war to new, vigorous, and more warlike adventurers.... The most famous connected to two almost mythical groups of people, the Menehune and the Mū (Wichman 2003:5).

The first group to settle on Kaua'i landed at the river mouth of Waimea in the Kona district. What they encountered was an area of abundant water and resources.

Kū'alu-nui-kini-akua stepped ashore at the mouth of Waimea river. It was an ideal place. There was abundant water from the swift rivers and streams that flowed within a protected canyon complex....There was good soil within the canyon valleys.... As the population increased, settlements spread inward into Waimea canyon and its side canyons, into the valleys of Nāpali along the southern coast to Koloa and northward to Wailua and Hanalei(Wichman 2003 5-7).

It was during this period that Kū'alu-nui-paukū-mokumoku was the ruling chief. His first wife had been murdered by his *kahuna nui* who wanted to go back to their homelands so he married Kahāpua, a chiefess born on the slopes of Pe'ape'a overlooking Hanapēpē Valley. When she became pregnant, Kū'alu arranged for her to live in the remote valley of upper Waimea in order to protect their child. During this time Kū'alu-nui-paukū-mokumoku sent back to his homeland for the Menehune who were masters of stonework and engineering and under his direction they built many *heiau*, fishponds and irrigation systems for wetland farming. The Menehune preferred to live on the ridge between Wainiha and Lumahai valleys (Wichman 2003: 7 -10). When his son Ola was of age he was brought to his father. Ola later became the ruling chief of Kaua'i and it was during his reign that many other works by the Menehune were constructed. However, years later Menehune Queen Mōhihi decided to take her people back to their homelands as the men were marrying Hawaiian women. They marched along the edge of Napili valleys to the plains of Hā'ena where they sailed away to their homeland (Wichman 2003: 8-12).

### 3.2.2 Developmental Period (600-1100 AD)

During the Developmental Period, 600 -1100 AD, as the founding groups grew, they fissioned into subgroups referred to as ramage, with the senior male of the original ramage as chief of the conical clan, although hierarchical ranking was not just relegated through the patrilineal line of descent (Kirch 1985:31). Bellwood refers to these groups as tribal and related by blood (Bellwood 1978:31). In *Ka Po'e Kahiko* Kamakau refers to Hawaiian ranking in the following passage:

For 28 generations from Hulihonua to Wakea, no man was made chief over another. During the 25 generations from Wakea to Kapawa, various noted deeds are mentioned in the traditions and well-known stories. Kapawa was the first chief to be set up as a ruling chief. This was at Waialua, O'ahu; and from then on the group of Hawaiian Islands became established as chief-ruled kingdoms - Maui from the time of Heleipawa, son of Kapawa and Kaua'i from the time of Luau'u[\*]. In [this] time...records (oral) began to be kept of the chiefs; of the day of birth, the land where each was born, the land where each was born, the places where the placenta (*a'a*) and its navel string (*ewe*) were deposited, the place where the navel cord (*piko*) was cut, the famous deeds of each, and the burial place where each was laid (Kamakau 1964:3).

[\*Luau'u (ca A.D. 1380) was the son of Kama-hano and Ka-'auea-o-ka-lani; grandson of Ahukini -a-La'a and Ha'i -a-Kama'i'o; great-grandson of La'a -mai-Kahiki, foster son on Mo'ikeha (Wichman 2003:39-41). These people could very well have been living in the later part of this period but more likely the early part of the Expansion Period.] (see Appendix G for Kaua'i Ali'i Aimoku)

Over time other settlers inhabited all the Hawaiian Islands. Many genealogies of Hawaiian *ali'i* indicate that Nana'ulu and 'Ulu (ca A.D. 830) were prominent ancient ancestors who settled all over the Pacific islands.

Thirteen generations or more than three hundred years, after Papa-nui-hānau-moku and Wākea, a chief of Tahiti, Ki'i and his wife, Hina -kō'ula, became parents of two sons, Nana'ulu and 'Ulu. When they were grown, Ki'i asked his sons to go on a voyage of discovery. All memory of the navigational signposts back to their original homeland were forgotten.... Nana'ulu sailed north in his canoe named *Manō-nui* (Great Shark) and found the islands of Hawai'i. The way from Hawai'i to Tahiti was charted. Voyagers came in increasing numbers (Wichman 2003:2422).

According to Kalākaua (1887/1990), it is likely that when Nana'ulu first landed in the islands, he did not find anyone else. This may be true if they landed on an island not yet inhabited by those from the north islands such as Kaua'i, Ni'ihau, Necker and Nihoa.

Nanaula, a distinguished chief, was the first to arrive from the southern islands. It is not known whether he discovered the group [Hawai'i] by being blown northward by adverse winds, or in deliberately adventuring far out upon the ocean in search of new lands. In either event, he brought with him his gods, priests, prophets and astrologers, and a considerable body of followers and retainers. He was also provided with dogs, swine and fowls, and the seeds and germs of useful plants for propagation. It is probable that he found the group without human inhabitants.

During that period --probably during the life of Nanaula --other chiefs of less importance arrived with their families and followers either from Tahiti or Samoa. They came in barges and double canoes capable of accommodating from fifty to one hundred persons each. They brought with them not only their priests and gods, but the earliest of Polynesian traditions. It is thought that none of the pioneers of the time of Nanaula ever returned to the southern islands, nor did others immediately follow the first migratory wave that peopled the Hawaiian group (Kalākaua 1887/1990:19-20).

The descendants of 'Ulu spread out over the South Pacific. Among them were extraordinary people who lived such wonderful adventures that storytellers had rich material to develop into entertaining sagas [e.g., Māui-ki'iki'i, 'Aikanaka-a-Mako'o, Hina-hānau-a-ka-mālama, twins Puna and Hema].... There were so many astonishing ancestors like these that the genealogists added them all into the 'Ulu genealogy (Wichman 2003:23).

Changes occurred during this period that brought about a uniquely Hawaiian culture, documented by the material culture found in archaeological sites. These include quadrangular adze, bone fishhook variations, *'ulu maika* (a game piece) stones, *lei niho palaoa* (necklace of bone or ivory and human hair worn by high ranked chiefs) and evidence of shifting cultivation. Kaua'i developed a unique form of poi pounder such as *pōhaku ku'i poi* (ring and stirrup pounders), double-grooved stone club heads, and a broad anvil *kapa* beater (Wichman 2003:6).

On Kaua'i there is evidence of ancient connections with the southern islands of Central Polynesia not found on the other islands of Hawai'i.... Differences are seen in the stone implements that were once used on Kaua'i, in styles of heiau, in language, and in the stories of the Menehune. Long considered a mythical people of Kaua'i, in reality the Menehune were a distinct people of an ancient time. Among the stone implements common to Kaua'i were two types of poi pounders restricted almost exclusively to that island.... The two Kaua'i types are the ring and stirrup pounders.... A discovery of significance was made in recent years on the island of Uahuka in the northern Marquesas when an "ancestor" stirrup pounder was discovered there. It is estimated, through radiocarbon dating that it was in use at sometime between A.D. 600 and 1300. This type of pounder had been found only on Uahuka and Kaua'i (Joesting 1984:19).

The archaeological evidence indicates that transient fishing camps were already utilizing Kō'e'e, Hā'ena prior to AD 1000 (Major and Carpenter 2001:38). According to Yent's (1980) Phase I of Hā'ena, there was transient settlement along the coastal terrace of Kō'e'e Beach from about 989 AD. Legends indicate that a chief of Hā'ena, Lohi'au, lived around this time and had several encounters with goddesses of Hawai'i Island; the structural remains of his house still exist.

As Pele and Hi'iaka danced in human form before Lohi'au on the hula platform at Ha'ena, gods and mortal Hawaiians alike could look at the cliffs - Na Pali - running down the coast beyond Kalalau, and at headland after headland, each marking another narrow valley as the wet of the north changed to the dry of the west. Glancing below and east, Lohi'au and his companions could see the blues, whites, and greens of Ha'ena itself, for Ha'ena was fronted by reef and the many blues of the Pacific, by the white coral sand of Ke'e beach, and the green of coastal vegetation, taro, and the cover of the mountainous cliffs immediately beyond. Lohi'au, his ancestors, and his descendants have lived at Ha'ena since perhaps before A.D. 1000 (Griffin 1984: 1).

General archaeological evidence indicates that the “ancestral pattern of corporate descent groups” were still in place at this time (Kirch 1985:30-2-3). The early culture evolved as the population grew, and many of the changes were related to significant socio-economic changes.

For thirteen or fourteen generations the first occupants of the Hawaiian Islands lived sequestered from the rest of the world, multiplying and spreading throughout the group. They erected temples to their gods, maintained their ancient religion, and yielded obedience to their chiefs. The traditions of the period are so meager as to leave the impression that it was one of uninterrupted peace, little having been preserved beyond the genealogies of the governing chiefs (Kalākau 1887/1990:20).

In about A.D. 1025 or perhaps a little earlier, the people of the group were suddenly aroused from their long dream of six centuries by the arrival of a large party of adventurers from Tahiti. Their chief was Nanamaoa. Their language resembled that of the Hawaiians and their customs and religions were not greatly at variance. They were therefore received with kindness, and in a few years their influence began to be felt throughout the group. They landed at Kohala, Hawai'i, and Nanamaoa soon succeeded in establishing himself as an influential chief. His sons secured possessions on Maui and O'ahu, and on the latter island one of them—Nanakaoko—instituted the sacred place called Kūkaniloko, in the district of Ewa, where it was the desire of future chiefs that their sons should be born.... This became the sacred birth-place of princes', as 'Iao, in Wailuku valley, on the island of Maui, became their *taboo* spot of internment. It was at Kūkaniloko that Kapawa, the son of Nanakaoko, was born. His principal seat of power was probably on Hawai'i, although he retained possessions on Maui and O'ahu (Kalākau 1888/1990:70-71).

But stronger leaders were soon to follow from the south. Among the first was the high priest Pā'ao, from Samoa [some say it was Society Islands]. He arrived during the reign of Kapawa, the grandson of Nanamaoa, or immediately after his death. The people were in an unsettled condition politically, and Pā'ao, grasping the situation, either sent or returned in person to Samoa for Pili, a distinguished chief of that island. Arriving with a large following, Pili assumed the sovereignty of the island of Hawai'i and founded a new dynasty. Pā'ao became his high priest, and somewhat disturbed the religious practices of the people by the introduction of new rites [ *luakini* or human sacrifice] and two or three new gods [Kūka'ilimoku] (Kalākau 1887/1990:20-21).

Kamakau (1991) says that there were seventeen generations during which Hawai'i Island was without chiefs—some eight hundred years. “The lack of a high chief was the reason for seeking a chief in Kahiki, and that is perhaps how Pili became the chief of Hawai'i” (island) (Kamakau 1991:101-102).

The Pā'ao/Pili influence created a major shift in “religion” and socio-economic patterns. Pā'ao brought with him the Kū practice of human sacrifice, used in monumental *luakini heiau* or war temples. Pili started a line of *ali'i nui* that would continue to the Kamehameha “dynasty.” The evolution of the *luakini heiau* is difficult to place archaeologically, and although the arrival of Pā'ao may have been a real event; the uniqueness and complexity of *heiau* were most likely a local (Hawaiian) development (Kolb 1989:3).

Two voyaging canoes set out from Tahiti fifteen generations after Nana'ulu and arrived on O'ahu and Kaua'i. Maweke and Paumakua settled peacefully on O'ahu and quickly became ruling chiefs of a district of that island (Wichman 2003:23).

[According to Kalākau (1887/1990)] The next arrivals of note [after Nanamaoa] from the southern islands were the two Paumakua families, one of which settled in O'ahu and Kaua'i and the other in Hawai'i and Maui.... The Paumakua family, which became so influential in Hawai'i and Maui, arrived during the early part of the reign of Pili, in about A.D. 1090. A large party accompanied the family, and they brought with them their gods, priests, astrologers and prophets. They first landed and secured possessions on Maui, but the sons and other relatives of Paumakua were brave and ambitious, and soon by conquest and marriage secured an almost sovereign footing both in Maui and Hawai'i (Kalākau 1888/1990:71-72).

At the same time, Puna-nui-ka-āina, whose genealogy has not survived, arrived on Kaua'i, having come, most likely, from the Marquesas Islands. Puna-nui-ka-āina arrived when the chief with the deadly riddles, Ka-iki-pa'a-nānea, was ruler of Waimea. The newcomer chose to settle along the banks of the Wailua River. This land came to be called Puna. There were now two chiefdoms on Kaua'i, Puna and Kona (Wichman 2003:23).

Newcomers were soon changing the socio-political structure of the island polities. There were attempts by some of the prominent families to join forces, but to no avail. Kalākau (1888/1990) explains:

At that time Kamauaua, a powerful chief of the ancient native line of Nanaula, held sway over the island of Moloka'i. He proudly traced his ancestry to the first migration in the sixth century, and regarded with aversion and well-founded alarm the new migratory tide which for years past had been casting upon the shores of the islands a flood of alien adventurers, whose warlike and aggressive chiefs steadily possessed themselves of the fairest portions of the group. He had sought to form a league of native chiefs against these dangerous encroachments; but the wily invaders, with new gods to awe the native nobility, had, through intermarriage and strategy rather than force, become the virtual rulers of Hawai'i, Maui, O'ahu, and Kaua'i, and he had abandoned all hope of seeing them supplanted. Moloka'i alone remained exclusively under native control, and its resolute old chief had from their infancy instilled into his sons a hatred of the southern spoilers and a resolution to resist their aggressions to the bitter end (Kalākau 1888/1990:71-72).

### 3.2.3 Expansion Period (1100-1650 AD)

The Expansion Period, 1100 -1650 AD, is significant for a number of reasons. Communication between the Hawaiian groups and southern groups suddenly ceases in the latter part of this period and oral histories don't offer any explanations. With the exception of Moloka'i and a portion of O'ahu who were of the Kamauaua and Maweke (ca 1230 AD) families from the Nana'ulu lines, all the others were of the southern chiefs and their descendants (Kalākau 1887/1990:21-22). Most of the “ecologically favorable zones,” the windward and coastal areas of all major islands, were now settled, and the more marginal leeward areas were being developed.

Archaeological evidence indicates that Hā'ena had permanent settlements and larger populations that utilized marine and inland resources by the 1200s (Yent's Phase II); permanent habitations were supported by wetland agriculture from this period to well into the 1700s (Major and Carpenter 2001:38; Yent 1980).

Legends reveal that during the 12<sup>th</sup> century, several Hua chiefs reigned on Maui who would later be connected to Kaua'i chiefs. Huanuikalalailai is the grandfather of Haho [Haho is the son of Paumakua (ca 1255 AD) who is buried in 'Iao; Haho also founded the *Aha-ali'i* (Kalākau 1888/1990:84-85)]; Haho is the grandfather of the famous Hāna twins Hanala'anui and Hanala'aiki who become the progenitors of the *ali'i nui* of Hawai'i Island, Maui, Moloka'i, Lāna'i, as well as O'ahu and Kaua'i (McKinzie 1983: xx).

Oral histories or *mo'ōlelo* of a southern adventurer winning the heart of a chiefess takes place on Kaua'i in the early part of this period, when Hina-a-ulu-a, daughter of Puna-ai-koā-i'i (son of Puna-kai-olohia and grandson of Puna-nui-ka-ia-āina, the first Puna chief of Wailua, Kaua'i), chooses newcomer Mo'ikeha (ca 1280 AD) over other local suitors. Puna-ai-koā-i'i, in order to be fair designs a contest where the suitors must swim to the island of Ka'ula off the southwest of Kaua'i, to retrieve a *lei paloa*. Mo'ikeha's genealogy indicated that he came from the Nana'ulu line down to Maweke. Maweke was a chief of a voyaging canoe from the south (Kahiki) who arrived in the islands two generations earlier and settled on O'ahu. An other advantage of Mo'ikeha was that his companion was La'a-maomao, owner of a calabash that kept all the winds of the world. Mo'ikeha's brother 'Olopana married a chiefess from Kohala. Mo'ikeha's wife, Hina-a-ulu-a gave birth to her three sons at the *heiau* Holoholokū, constructed

for Mo'ikeha by orders of his father -in-law Puna-'ai-koā-i'i. From then on all *ali'i nui* on Kaua'i were born at the birthing stones there (Wichman 2003:24 -29).

During the early part of this period (ca 1305 AD) the three sons of Mo'ikeha were settled on three different islands, O'ahu, Hawai'i and Kaua'i.

Ho'okamali'i, the oldest, moved to O'ahu to become the ruling chief of the Kona district and settled on the plains of Ewa. Kila went to Waipi'o on Hawai'i.... Haulani-nui-ai-ākea remained on Kaua'i, where on Mo'ikeha's death, he became *'ali'i nui* [Mo'ikeha's bones were taken to Ra'iātea by La'a-mai-Kahiki, his foster son]. Haulani-nui-ai-ākea proved to be an unsatisfactory *'ali'i nui*. Other Kaua'i chiefs, under the leadership of Ke-oloewa-a-Kamaua, deposed their unfit ruler. Ke-oloewa-a-Kamaua was a Moloka'i chief married to one of Maweke's granddaughters.... Haulani-nui-ai-ākea was easily overthrown. When Ke-oloewa-a-Kamaua refused the throne, Kila was asked to come to Kaua'i and take over as *'ali'i nui*...his heart was not on Kaua'i. He placed the highest ranking *ali'i* in the family, the beautiful Ka'ilī -lau-o-ke-koa, as paramount chief, returned to his canoe and sailed to Ra'iātea to remain the rest of his life (Wichman 2003:35).

The advisors of Ka'ilī -lau-o-ke-koa wanted her to marry Ke -li'i-koa, the Kona (Kaua'i) chief, but she declined. A lot of intrigue followed this decision along with attempted murder. This led to several centuries of war between the Kona and Puna chiefdoms. But it was during her reign that Ka'ilī -lau-o-ke-koa organized the women of Wailua to fight in the battle instigated by the Kona chief Ke -li'i-koa, who was eventually killed by Ka'ilī -lau-o-ke-koa with her *pīkoi* (tripping club). Sadly, Ka'ilī -lau-o-ke-koa died later without any heirs. The chiefdom was offered to Ahukini -a-La'a (ca 1305-1355 AD), the oldest son of La'a-mai-Kahiki (ca 1305 AD); followed by his son Kama -hano (ca 1330-1380 AD), then his son Lu'anuu'u (ca 1355-1405 AD) (Wichman 2003:36-41).

Lu'anuu'u (ca 1355 -1405 AD), grandson of Ahukini -La'a (ca. 1305 -1355 AD), was named after the grandfather of Ki'i, father of 'Ulu and Nana'ulu. He was a good chief and was greatly admired in spite of the continuing wars with Kona - references to him indicate a close relationship to Kona. During the time of Lu'anuu'u there was a great warrior named Palila, son of Ka -lua-o-pālena and Maihi-iki. He was taken at birth and raised by his grandmother Hina in a sacred temple of Alana -pō where he was trained very well. Later he helped his father defeat Kona chief Ka -maka-o-ka-lani on the plains of Koloa. Shortly after, a messenger from the ruling chief of O'ahu arrived asking for Palila's help. Palila had many adventures on O'ahu and Hawai'i and later became the ruling chief of Hilo (Wichman 2003: 44-47).

Kūkona (ca 1380-1430 AD) [son of Lu'anuu'u] inherited an island at war and left it united as one kingdom. From then on, the legends of the Kona kingdom were seldom told and the genealogies of the first settlers were forgotten.... Kūkona's *ali'i wahine* was Lau-puapua-ma'a and they had twin sons, Mano-ka-lani-pō (ca 1405 AD) and Palekaluhi. When Kūkona became *ali'i nui* (ca 1405 AD) of Puna, the Kona chief was Makali'i -nui-ku-a-ka-wai-ea. He had been at the royal court of O'ahu for many years and several times had fought in battles against Kama -pua'a.... Makali'i-nui-ku-a-ka-wai-ea had been sent by Kama-pua'a to the royal court with the bad news of defeat. Eventually Makali'i-nui-ku-a-ka-wai-ea returned home to Waimea and organized his own force. Makali'i-nui-ku-a-ka-wai-ea's army included the father and older brother of Kama-pua'a (Wichman 2003:47-48).

Kona and Puna forces met once more in battle in Koloa. After a stalemate the two kingdoms merged with Kūkona as the *ali'i nui* (ca 1405 AD). To insure the success of this situation, Nae -kapu-lani, the daughter of Kona's Makali'i-nui-ku-a-ka-wai-ea was married to Mano -ka-lani-pō (ca 1405 -1455 AD), son of Puna's Kūkona.

The archaeological evidence indicates that during this time (1400s) in Hā'ena, the use of inland irrigated agriculture reflects intensification; beach habitation declines, but activity areas persist on the dunes

(Major and Carpenter 2001:38). Yent's (1980) Phase III of Hā'ena (ca 1400 AD) are permanent settlements on the coastal terrace and alluvial plain with the development of an intensive irrigated agricultural complex that supports a subsistence economy that still includes marine resources with added domesticated mammals (Dye 2002:5).

A legend (Skinner 1902:212-216) tells about a Japanese vessel wrecking on Maui in the 1200s (according to Wichman's dates it was in the 1400s). The captain and his sister marry into *ali'i nui* families, but what is most significant about this story is the metal sword that the Captain had. During this period the *ali'i nui* of Hawai'i Island was Kalaunui [Ka -lau-nui-o-Hua] who had subdued Maui [Ka -malu-o-Hua] and Moloka'i [Ka-haku-o-Hua] and on O'ahu [Hua -i-pou-leilei] a great fight ensued. In the battle the Captain fought bravely with his sword, but was finally struck down by a warrior named Kaulu, son of Waahia, a seer of great renown. Rather than turn the sword over to the Hawai'i king, Kaulu buried it on the spot. He later retrieved it and put it into his mother's (Waahia) care before the Hawai'i contingency headed for battle on Kaua'i [where Kūkona (ca A.D. 1380-1430) was the ruling chief].

The Hawai'i warriors were overcome and defeated [by Kūkona] before they could even land their canoes by the sling stones and javelins of the Kaua'i warriors. The Hawai'i king Ka -lau-nui was taken prisoner and the kings of Maui, Moloka'i and O'ahu who were hostages of Ka -lau-nui were set free. Kaulu escaped with a remnant force only to be accused by the queen of cowardice. In the negotiations for the release of Kalaunui, the queen offered several things: a fleet of canoes with many spears; twenty feather cloaks with stone axes, ivory and whalebone; but these were all rejected. The last resort was to offer her daughter in matrimony to the king of Kaua'i. This too was rejected. After three years and unsuccessfully trying to get an army together, the queen was ready to give up. This is when Waahia asked for an audience at court. She explained that she alone could rescue the king, but the court had to grant whatever her wish was when they returned. They agreed and Wa'ahia left Hawai'i Island with a single oarsman for Kaua'i. They arrived during Makahiki festivities and Wa'ahia got an audience in court. Her offer was the Japanese sword "that was harder than stone, that broke spears like reeds, that gave its owner supreme fortune and supreme command." The offer was accepted. Before the release of Kalaunui, Wa'ahia had him agree that his release was contingent on him giving his daughter to her son in marriage. This too was agreed on [see also Wichman 2003:49 -52].

Once Kaua'i was united as one kingdom and was free from any threat of invasion from its windward neighbors, attention was focused on the development of a solid political system based on land division. The paramount chief ruled the entire island, owned all the land, and had the power of life and death over the people, *ali'i* and *maka'āinana* alike. To help him govern, the *ali'i nui* chose a *kalāimoku* (prime minister, land manager) to advise him on all practical and civil matters. The royal establishment was kept at Wailua, although there was also a permanent home at Waimea.... Kaua'i was divided into six *moku* (districts), which were governed by an *ali'i a'imoku*, each carefully chosen for his loyalty and close relationship to the ruling chief. The largest district was Kona, the former kingdom centered at Waimea, followed by Puna (Wichman 2003:53-54).

The genealogy of Kaua'i *ali'i* was considered the most ancient and impeccable in all the Hawaiian islands. *Ali'i* from other islands were eager to introduce the Kaua'i bloodline into their own.... A chiefess would live with a Kaua'i chief for a time, bear one or more children, then send the chief on his way, leaving his bloodline and genealogy to mingle with those of her own family on Maui and Hawai'i. Marriage to the O'ahu families was commonplace for Kaua'i chiefesses. It was a peaceful kingdom that Mano-ka-lani-pō inherited and helped to create. He ruled over the Golden Age of Kaua'i history (Wichman 2003:55).

This was also the period of the greatest population growth, the development of large irrigation field system projects, and dry land farming. The uniquely Hawaiian invention, the *loko* or fishpond aquaculture, was developed in the fifteenth century or the latter half of this period (Kirch 1985: 303).

Monumental *heiau* building flourished in this Period, as “religion” became more complex. Other monumental building included irrigation ditches or *auwai* such as the Pi’ilani *Auwai* in Lahaina, Maui and the Menehune Ditch in Waimea, Kaua’i.

During the last 200 years of the Expansion Period, the concept of *‘āhupua‘a* was established, as well as class stratification, territorial groupings, powerful chiefs and “*mo‘i*” or king (Kirch 1985:303-6). Most prominent during this period was Liloa and Umi of Hawai‘i Island; Kawaokalohe, Pi’ilani and his children Lono-a-Pi’ilani, Pi’ikea and Kiha -a-Pi’ilani of Maui; Kakuhihewa and Ku’alii of O‘ahu; and Kalanikūkama, Kamakapu and the beginning of the Kawelo line of *ali‘i nui* on Kaua’i.

Legends mention a few times where foreigners ship -wrecked or landed on the shores of various Hawaiian Islands. One story takes place during the reign of Kealiokaloa, son of Umi -a-Liloa, who reigned about 1525-30 AD on Hawai‘i Island. A vessel was wrecked at Ke‘ei, South Kona at a place now called Kulou, the captain and his sister reached shore in safety. They intermarried with the natives. Centuries later it was learned that on October 31, 1527, three vessels fitted out by Spaniard Cortez, conqueror of Mexico, left Zacatula for the Moluccas. About 1,000 leagues from port they were separated by a severe storm and two smaller vessels never made it to their destination. Later in 1555 the Spanish navigator Juan Gaetano discovered these islands; and ancient manuscript chart in Spanish archives indicates a group of islands in the same latitude as the Hawaiian Islands, but over ten degrees longitude too far east. In June 1743, a British warship captured a Spanish galleon near the Philippine Islands and found a manuscript chart on board with the same group of islands charted the same as the 1555 chart in the archives (Wisecarver 1993:11).

*Mo‘olelo* about events that took place in the early to mid 1600s were revealing in that they illustrate that many of the battles of this period were relatively quickly contained by the opposing *ali‘i* [see *History of Kuali‘i* (Kuali‘i ca. 1630-1660s) in Fornander 1917:IV: II: 364-434]. These stories also illustrate the ongoing inter-relationships between the people of the various islands. In the *History of Kuali‘i*, the exploits of Kuali‘i (great-great grandson of Kakuhihewa (ca. 1580 AD, *ali‘i nui* of O‘ahu) take him to every is land and he eventually unites all the islands “from Hawai‘i to Ni‘ihau” (Fornander 1917: IV: II: 406).

### 3.2.4 Proto-Historic Period (1650-1795 AD)

The Proto -Historic Period, 1650 -1795 AD, appears to be marked with both intensification and stress. Yent’s (1980) Phase IV of Hā‘ena – historic contact period - indicates a decrease in the population and a reduced occupation of Hā‘ena ca 1700-1800. Wet taro was grown in a terraced system on the alluvial plain irrigated by Limahuli Stream and sweet potatoes were grown on the coastal terrace (Handy & Handy 1972:429 In Dye 2002:5).

Many wars took place during this time between intra -island chiefdoms and inter -island kingdoms. However, it was during this period that the *Royal Kolowalu Statute* or Kuali‘i’s Law was enforced. Kuali‘i Kuniaakea Kuikealaikauakalani (ca 1655? -1730 AD) lived for a long time, was said to sometimes have supernatural powers, and was the first to “unite” all the islands. Kū-ali‘i acquired Kaua‘i (ca 1680 AD) after the deaths of cousins [Kawelo had ceded Kaua‘i to Kū-ali‘i should they both die in battle there. Kū-ali‘i was a descendant of the Kawelo line on his grandmother’s side.] Kū-ali‘i went to Kaua‘i and declared himself *ali‘i nui* and installed his son Pele-iō-hōlani (ca 1680-1755+ AD) as governor (Wichman 2003:89).

It (Kuali‘i’s Law) was strict, unvarying and always just. It was for the care and preservation of life; it was for the aged men and women to lie down in the road with safety; it was to help the husbandmen and the fishermen; to entertain (morally) strangers, and feed the hungry with food. If a man says, “I am hungry for food,” feed (him) with food, lest he hungers and claims his rights by swearing the *Kolowalu* law by his mouth, whereby that food becomes free, so that the owner

thereof cannot withhold it; it is forfeited by law. It is better to compensate.... A transgressor or one who is about to die, is, under the application of this law exonerated of his death or other penalty...(Fornander 1917: IV: II: 432).

Kū-ali‘i, *ali‘i nui* of O‘ahu, died at Kailua in Ko‘olaupoko in 1730 AD, supposedly at the age of one hundred and seventy five.

When Pele-iō-hōlani left Kaua‘i to pursue his destiny as the future ruler of the O‘ahu kingdom, he left his daughter Ka‘apuwai as governor of Kaua‘i. She was the first chiefess since Ka‘ili-lau-okekoa, some centuries before, to become paramount ruler. She was married to Ka‘ume-he-iwā, a high chief of Kaua‘i. They were both descended from Ka-lani-kukuma, and their marriage joined the junior and senior genealogical lines that stemmed from their common ancestor, thus giving their daughter Ka-maka-hele a stronger *mana* than either of her parents (Wichman 2003:92).

In 1736, Maui *ali‘i nui* Kekaulike died. He chose his *nī‘aupi‘o* son Kamehameha -nui to be his heir, though Ka‘uhi‘aimoku-a-Kama was the oldest he was of a slightly lower rank.

Ke-kaulike had many children by his wives (*wahine*) and female retainers (*haha wahine*). Ka-uhī‘aimoku-a-Kama by Kaha-walu was the first born; Manu-ha‘a-ipo, Ke-hau-hiwa-moku and Ka‘eo [kulani] were the children of Holau; Kamehameha -nui, Ka-lola, Ka-hekili and Ku -ho‘oheihai-pahu, of Ke-ku‘i-apo-iwa-nui; Na-mahana and Ke-kua-manoha of Ha‘alo‘u.... When Ke-kau-like heard that the ruling chief of Hawai‘i was at Kohala on his way to war against Maui, he was afraid and fled to Wailuku in his double war canoe named Ke -aka-milo. He sailed with his wives and children...his officers, war leaders, chiefs, and fighting men, including warriors, spearmen, and counselors.... The fleet landed at Kapa‘ahu at the pit of Aihako‘ko in Kula. Here on the shore the chiefs prepared a litter for Ke -kau-like and bore him upland to Haleki‘i in Kukahua. There Ke -kau-like died, and the sound of lamentation for the dead arose. Then fearing the arrival of Alapa‘i bent on war, the chiefs cut the flesh from the bones of Ke -kau-like in order to lighten the load in carrying the body to ‘Āo (for burial) (Kamakau 1992:69).

Alapa‘i sailed from Kohala on Hawai‘i with a great company of chiefs of Hawai‘i, his war leaders, warriors, and the district chiefs of the island...but when he landed at Mokulau in Kaupō and heard that Ke-kau-like was dying, he gave up all thought of war and wished only to meet Ke -kau-like and his (half) sister Ke -ku‘i-apo-iwa-nui. He heard that Kamehameha -nui had been chosen ruler over Maui and he had no desire to make war upon his sister’s child (Kamakau 1992:70).

In 1737 and 1738 a couple of great battles took place in the districts of Lahaina and Kā‘anapali. Kauhi-‘aimoku-a-Kama (Kauhi), oldest son of Ke -kau-like rebelled against his younger brother, Kamehameha -nui. “Near the house of David Malo is a breadfruit tree on which the first victim of the battle was laid. There the fighting men of Kamehameha -nui were slaughtered.” This prompted Kamehameha-nui to flee to his uncle’s canoe, big island *ali‘i nui* Alapa‘i-nui-a-Ka-uaua (Alapa‘i), who took him to Hawai‘i island where they spent a year preparing for war. Alapa‘i was the half -brother of Kamehameha -nui’s mother (Kamakau 1992:73-74).

When Ka-uhī heard that Alapa‘i was heading back to Maui, he enlisted the help of his uncle, Pele -iō-hōlani, Kaua‘i *ali‘i nui*, ruling chief of O‘ahu, son of Kū-ali‘i and cousin of Alapa‘i. Alapa‘i attacked Maui (1738 AD), drying up the streams of Kaua‘ula, Kanaha and Mahoma near Lahainaluna, destroying the taro patches. His men kept guard over the streams of Olowalu, Ukumehame, Wailuku and Honokawai (sic). “When Pele-iō-hōlani heard that Alapa‘i was in Lahaina he gathered all his forces at Honokahua and at Honolua. At Honokawai (sic) an engagement took place between the two armies, and the forces of Alapa‘i were slaughtered and fled to Keawawa.” Pele-iō-hōlani had 640 men to Alapa‘i’s 8,440. The cousins once again came face to face in Pu‘unene and decided to once more opt for peace between the families. Kamehamehanui ruled Maui in peace; Pele -iō-hōlani retired to Moloka‘i, and Alapa‘i went back to rule Hawai‘i (Kamakau 1992:74).

About 1755 AD Kaua'i's rule went to Ka-maka-helei, granddaughter of Pele-iō-hōlani.

Ka-apuwai died before her father [Pele -iō-hōlani], and the government of Kaua'i passed to Ka-maka-helei... [who] owed allegiance to her grandfather Pele-iō-hōlani.... Her first husband was a Kaua'i chief, Kiha, and with him she had three children: first a daughter, Lele-māhoa-lani, then a son, Keawe, and finally another daughter, Ka-lau-i-pihana. Then Pele-iō-hōlani sent his grandson Ka-neoneo to Kaua'i to ensure the island would remain loyal to him. Ka-neoneo and Ka-maka-helei were first cousins, and soon Ka-maka-helei put Kiha aside and took Ka-neoneo for her husband (Wichman 2003:92-93).

A few years later, around 1759 AD, High Chief Kalani'ōpu'u from the Island of Hawai'i made war on East Maui and conquered Hāna from *ali'i nui* Kamehameha-nui, brother of Kalola and Kahekili. Kalani'ōpu'u took control of Hāna's prominent Pu'u Kau'iki as his fortress. He appointed one his chiefs, Puna, as "governor" of Hāna and Kīpahulu (Kamakau 1992:81-82). Kamehameha-nui relinquished Hāna and lived in peace in West Maui with his wife and half-sister, Namahanaikaleleonalani. In 1766 the peaceful Maui *ali'i nui* died. After ruling Maui for 29 years, Kamehamehanui was taken ill at Kawaipapa, Hāna on a journey about the island. While still in Hāna Kamehamehanui ceded his lands to his younger brother Kahekilinui'āhumanu (Kahekili), a fierce warrior and "manipulator" (Kamakau, 1992:82-84; Kame'eiehiwa 1992:47).

But according to Kalākau (1990:353) Kamehamehanui "died very suddenly at Wailuku, which had been his favorite place of residence." During the period of mourning for him, his successor and younger brother, Kahekili "removed his court to Lahaina." It was while there that they were visited by an *ali'i* from Hawai'i Island. The visitor was Ke'eaumoku, son of Keawe-poepoe, who was the son of Lonoikahaupu (sovereign of Kona, Kaua'i) and Kalanikauleleaiwi (half sister/wife of Keawe, once *moi* of Hawai'i Island). Years before, after the death of his uncle Alapa'inui [Hawai'i Island *moi*], in 1754, Ke'eaumoku was discontent with the rule of his cousin Keaweopala so he joined forces with Kalani'ōpu'u of Ka'ū and defeated Keaweopala in Kona, making Kalani'ōpu'u, grandson of Keawe, the new *moi* of Hawai'i Island. Ke'eaumoku fortified himself in Kohala and later (1765) incurred the wrath of Kalani'ōpu'u and was attacked by him. Ke'eaumoku escaped and spent some time on Lāna'i before heading to Maui just after the death of Kamehamehanui. To the displeasure of Kahekili, Ke'eaumoku promptly won the heart of Namahana [I], the widow of his brother (Kalākau 1888/1990:353-356), and also his half-sister [Kekaulike was their father, but they had different mothers]. After the couple settled in Waihe'e (Namahana's lands), Kahekili decided to re-locate his court to Wailuku.

With the help of his nephew Kahahana, who was also a landholder of Waihe'e, Kahekili contrived to find cause to battle Ke'eaumoku. To this end he was successful, causing Ke'eaumoku, Namahana, her mother, two brothers and a considerable following of chiefs and retainers to flee to Moloka'i. This did not stop Kahekili who invaded Moloka'i with a large force, and once again defeated Ke'eaumoku. Barely escaping, Ke'eaumoku, Namahana and their entourage fled to Hāna which was still under the control of Hawai'i Island. There he was forgiven by Kalani'ōpu'u and given shelter by Mahihelelima, governor of the Hāna district (Kalākau 1888/1990:357-358). While in Hāna, Namahana (I) gave birth to Ka'āhumanu in 1768 (Kalākau 1888/1990:359) in a cave at the base of Pu'u Kauiki; she would later play a pivotal role in the history of Hawai'i.

During this period the socio-political intrigue continued to affect all islands including Kaua'i.

On O'ahu, Kūmahana, who was Pele-iō-hōlani's regent, proved himself to be an entirely unsatisfactory ruler. The O'ahu chiefs rebelled against him and sent Kūmahana, his wives, and children into exile on Kaua'i. Pele-iō-hōlani returned posthaste from his skirmishes against Kahekili on Maui to renew his claim to O'ahu. Kahekili...took this opportunity to lead his forces once again against those of Pele-iō-hōlani. After several battles, Kahekili was victorious. To

consolidate his rule, he married his sister Kalola to Ka-lani'ōpu'u of Hawai'i in the hopes that he would either help by sending men and arms or at least, remain indifferent to the situation.... From O'ahu, Pele-iō-hōlani sent Ka-neoneo to join him to help stem Kahekili.... This left Ka-maka-helei vulnerable. Although she was the nominal ruler of Kaua'i, her uncle Kūmahana began to make his moves to take over her government (Wichman 2003:93).

Kahekili...was quick to realize the opportunity this presented to neutralize Kaua'i. He sent his young half-brother Ka'eo-kū-lani to Kaua'i to woo Ka-maka-helei. Ka'eo-kū-lani was successful...since she was nine years older than Ka'eo-kū-lani, she did not expect to bear any more children, and her oldest son, Keawe, was named heir to the kingdom.... By this time, all of Maui, Moloka'i and Lāna'i were under the rule of Kahekili who had succeeded in taking them from Pele-iō-hōlani. He was gearing up for an invasion of O'ahu where Pele-iō-hōlani, now a very old man, had turned over the government to his grandson Kaneoneo (Wichman 2003:93-94).

In 1775 Kalani'ōpu'u, son of Ka-lani-nui-l-a-mamao (whom the *Kumulipo* was composed for) and his forces in Hāna raided and severely destroyed the neighboring Kaupō district, before continuing several more raids on the islands of Moloka'i, Lāna'i, Kaho'olawe and parts of West Maui. He returned again in 1776 and for several years later, raiding and treating the *maka'ānana* cruelly.

The Alapa, the fierce fighting men of Kalani'ōpu'u, were defeated; only two men escaped. The chiefs and fighting men of Kalani'ōpu'u wanted to continue; "tomorrow we will drink the waters of Wailuku and rest in the shade of Hekuawa." Kahekili prepared for the "great battle" which took place on the sand hills between Waikapu and Wailuku; Ka-hahana, now ruling chief of O'ahu and Moloka'i came to his aid.

Kahekili stopped that war and made peace at the request of his sister Ka-lola, but a few years later Kalani'ōpu'u once again sailed to ravage the lands of Maui and Lāna'i. It was during this war that Kamehameha I, nephew of Ka-lani'ōpu'u was noticed as a great and brave warrior by both sides.

In January 1778 Cook landed in Waimea, Kaua'i and the culture of old Hawai'i began its spiraling change (Day 1992). Fishermen off of Koloa, Kaua'i first saw the ship *Discovery* and rushed to tell Kaua'i *ali'i nui* Ka-maka-helei and Ka'eo-kū-lani. The *kahuna nui* Kū'ōhu declared "that can be nothing else than the *heiau* of the god Lono. In the center is the tower of the demi-god Ke-o-lewa, and there in the back is the place of sacrifice at the altar" (Wichman 2003:94; see also Kamakau 1961:92-96). However, after several days of observation the *kahuna* concluded that these were not gods, but men. He said they were like the two white priests who had come to the islands when Paumakua was living and they were like the *haole* Kū-ali'i had seen on his travels less than a hundred years earlier (Wichman 2003:94). According to Captain Clerke, he was visited by a young chief named Kaneoneo; up to this time "no chief had come to see either Clerke or Cook" (Beaglehole 1967:38 In Kikuchi et al 1978:8). According to Wichman (2003) and Kamakau (1961:93-96) Ka-neoneo was now on O'ahu, replaced by Ka'eo-kū-lani as husband of Ka-maka-helei, granddaughter of Pele-iō-hōlani.

[Ka-maka-helei] sent three men on board to see what this strange ship really was and to assess those on board. These three were *kahuna* Kū'ōhu, wearing his *lei palaoa* (necklace of woven human hair holding a hook of carved whale ivory), chief Kāne-a-ka-ho'owaha, and chief Kī'i-kikī who was Ka'eo-kū-lani's trusted man who had come with him from Maui.... Captain Cook gave Kū'ōhu a dagger, a gift beyond price. It was the first gift from Western civilization to Hawai'i, and it was considered an omen.... Kī'i-kikī reported back to Ka'eo-kū-lani and described the dagger. Ka-pupu'u, one of the guards surrounding Ka'eo-kū-lani...went out to the ship and saw quantities of iron things just lying about on deck. He grabbed as many pieces as he could and threw them into his canoe. One of the ship's guards raised his rifle and shot Ka-pupu'u dead. He was the first Hawaiian to die by a bullet....

Some chiefs thought that Captain Cook should be put to death for killing Ka-pupu'u but the

*kahuna* Kū'ohu said "No they were not to blame... Kapupu'u was to blame, for he went to steal even though our *ali'i nui* had forbidden it." The following day Captain Cook came ashore for the first time. His longboat landed at the mouth of the Waimea River, on the beach of Luhi beside Lā'au-ōkala point. He was greeted by a huge crowd of people pushing and shoving to get a look at this...living god come among them. People had come from Nāpali, Mānā, and Kīptū like a rushing stream during the night.

Captain Cook wandered about Waimea for a time before returning to his ship.... Ka-maka-helei presented gifts to Cook: hogs, chickens, bananas, taro, sweet potatoes, sugarcane, yams, fine mats, and tapa cloth. In return Cook presented them with cloth, iron, a sword, knives, bead necklaces, and mirrors. Then Ka-maka-helei offered Cook her own daughter, Lele-mahoe-lani. According to the Kaua'i source of this story, she spent the night on board with Cook. She left the following morning laden with presents (Wichman 2003:9596).

Cook also gave the chiefs some goats (Beaglehole 1974:677 In Mills 1996:72), sheep and a new breed of pigs (Joesting 1984:199). After visiting Hawai'i Island Cook left Hawai'i for several months, but returned later in the year. Kalani'ōpu'u was fighting Kahekili's forces in Wailua, Maui on November 19, 1778 when Cook's ship was sighted on his return trip to the islands. Kalani'ōpu'u visited Cook on the *Resolution*, while Kahekili visited Clerke on the *Discovery* (Kuykendall and Day 1976:16). When Cook sailed into Kealahou Bay on January 17, 1779, Kalani'ōpu'u was still fighting Kahekili on Maui. At this time Kahekili's brother, Kaeo was ruling chief of Kaua'i [co-ruler with Ka-maka-helei, granddaughter of Pele-i-ō-hōlani]; Kahekili's nephew Ka-hahana of O'ahu and Moloka'i; Kalani'ōpu'u of Hawai'i and Hāna [eastern Maui]; and Kahekili of western Maui, Lāna'i and Kaho'olawe (Kamakau, 1992:84-86, 92, 97-98). On January 25<sup>th</sup> Kalani'ōpu'u visited Cook again at Kealahou Bay, presenting him with several feather cloaks. By February Cook's scheme to kidnap Kalani'ōpu'u as a hostage were thwarted and Cook was killed following a skirmish over a stolen cutter (Kuykendall and Day 1976:18). His ships and crew visited Kaua'i once more (1799) after Cook's death. A battle had taken place the day before and warriors had been killed. It was also evident that venereal disease had spread throughout the island as a result of their first visit to the island (King 1967: part 2:585 -586 In Mills 1996:78).

On Kaua'i:

In 1780, Ka-maka-helei gave birth to another son, Ka-umu-ali'i. The situation on Maui grew uncomfortable for Kahekili. He sent a message to his brother Ka-ko-kū-lani to return to Maui. Ka-ko-kū-lani brought his two trusted counselors, Kī-i-kī and Kai-awa with him. Ka-umu-ali'i, his son with Ka-maka-helei, was declared heir to Kaua'i, passing over his older half-brother, Keawe (Wichman 2003:9697).

The warring between the Hawai'i and Maui forces continued. On his way to Kona from Ka-umu-ali'i, Kalani'ōpu'u was taken ill. He went instead to Ka'iliki'i at Waio'ahukini in Pakini where he died in January 1782. In 1781 a few months before the death of Kalani'ōpu'u, when Kahekili heard how ill Kalani'ōpu'u was, he split his forces and sent them through the south-eastern Kaupō Gap and the north-eastern Ko'olau Gap into Hāna. After damming and diverting the supply of spring water to Pu'u Kau'iki, the Hawai'i chiefs were finally defeated, and the Maui *ali'i nui* regained control of Hāna in 1782 (Kamakau, 1992:84-86; 110, 115-116; Fornander 1900: Vol II 146-7, 150, 216).

But what became of Ke'eumoku and his family [wife Namahana and daughter Ka'ahumanu], whose home for years had been the hills of Hāna? Learning of the meditated invasion of the district, and unwilling to trust himself to the mercy of Kahekili, Ke'eumoku fled with his family to the almost barren island of Kaho'olawe, where he lived in seclusion until after the fall of Kauhiki and death of Kalani'ōpu'u, when he boldly returned to Hawai'i, quietly settled on his old and inalienable estates at Kapalilua, in South Kona, and awaited the development of events, which he perceived were rapidly and irresistibly tending toward widespread revolution and disorder. For

more than fifteen years he had heard the clash of arms only at a distance, and he yearned for the shouts of battle and the music of marching columns (Kalakaua 1888/1990:361).

Kahekili reclaimed Hāna, then through war and trickery went on to gain control of all the islands except Hawai'i (Kamakau 1992:116, 128 -141).

The O'ahu chief [Ka-hahana, nephew and foster son of Kahekili] was living in Nu'uano Valley above Honolulu when he received word that Kahekili had landed on the beaches with a large fleet of war canoes and was gathering his warriors about him for an attack on the defenders of O'ahu. In January 1783, a decisive battle was fought. Kahekili's wife, Kau-wahine, who was also a noted fighter, took part in this battle.... Confusion seized the ranks; the warriors of Ka-hahana were dispersed while he and his wife fled to the forest. Thus, O'ahu and Moloka'i were taken by Kahekili.... [However] fighting erupted on his home island of Maui among minor chiefs... [along with] the growing threat from Hawai'i.... Kahekili's son and designated heir, Ka-lani-kū-pule, was dispatched to Wailuku to prepare for the coming attack. Ka-lani-kū-pule took with him Maui's war leaders and Kahekili's best warriors, the battle-scarred veterans of the war on O'ahu (Speakman 2001:4041).

In early 1790 when Captain George Vancouver made his first stop in the Hawaiian Islands he was told that Kalani'ōpu'u was dead; Hawai'i was ruled by Keoua Kuahū'ula (half-brother of Kiwala'ō), his uncle Keawe-mau-hili, and Keoua's cousin, Kamehameha (Day 1984:77). Vancouver went on to trade with Kalanikūpule in Waikīkī. He then found that the ruling chief of Kaua'i, Ka-umu-ali'i, was a mere child; his father Ka'eo was on Maui with Kahekili. Vancouver also noted a decrease in the population and the number of chiefs since the arrival of Cook (Kamakau 1992: 162 -163), but foreigners continued to arrive.

In spite of the ongoing battles, the foreign explorers and merchants were not deterred; foreign vessels continued to come to the islands.

By 1790 several other foreign ships also visited the islands, helping to establish them as a "familiar resort for the fur traders" and as a "port of call and wintering place -- for those engaged in the more general trade which grew up between Asia and the west coast of North and South America." These voyagers included English Captains Portlock, Dixon, and Meares and French naval vessels under the command of La Perouse.... Because of their excellent harbors and strategic location nearly equidistant from the coasts of the Orient and North America, the Hawaiian Islands quickly became a primary stop on the Pacific trade routes. These islands contained more cultivated land than most of the other Pacific islands, forming "an oasis in the ocean desert" (Greene 1993: Chap II).

By 1790 Kamehameha I had gained enough control of the island of Hawai'i from his uncles and cousins that he could leave to join the war parties on Maui. His canoe fleet "beached at Hāna and extended from Hamoa to Kawaipapa" to battle Kalanikūpule, son of Kahekili (who now ruled from O'ahu). After several battles along the East Maui coast, Kamehameha's forces reached Wailuku where the "great battle" took place. This would be the beginning of the end of independent ruling chiefs because of the inequity of battle strategy and weaponry. Kamehameha had brought a cannon from the *Eleanora* along with her captain, Isaac Davis, and crewmember John Young, who were now his *aikāne punahele* (favorites) and advisors (Kamakau 1992:147 -148). This battle of 1790 was known as the *Battle of Kepaniwai* where the bodies of fallen warriors dammed the I'ao Stream in Wailuku or "water of destruction" (Engelbreton 2000:2).

While Kamehameha was at Wailuku with his followers he heard of Ka-lola's being on Moloka'i with her daughters and granddaughter and he sent word by Kikane for her not to proceed to O'ahu as he was coming to escort her to Hawai'i. He sailed with a great company, among them Ke'eumoku, Keawe-a-heulu, Ka-me'e-ia-moku, and Ka-manawa, the brothers of Ka-lola, and landed at Kaunakakai. They met Ka-lola at Kalama'ula and, when Kamehameha saw how ill she

was and of an incurable disease according to kahuna's diagnosis, he asked, "Since you are so ill and perhaps about to die, will you permit me to take my royal daughter and my sisters [Ke-opu-o-lani, her mother Ke -ku'i-apo-iwa and aunt Ka -lani-hau-io-kikilo] to Hawai'i to rule as chiefs?" Kalola answered, "If I die, the girl and the sisters are yours." Then Kamehameha and all the chiefs waited until the death of Ka-lola [widow of Ka-lani-ōpu'u; sister of Kahekili and highest ranking *ali'i*] (Kamakau 1992:149).

While Kamehameha was on Moloka'i waiting for the passing of Kalola, *kapu* chiefess of Maui, he sent two messengers to O'ahu; one to Kahekili and one to find the Kaua'i *kahuna* Kapoukahi of the *kahuna* order Huli honua, as he was skilled in the art of reading omens and signs. It was he who advised that if Kamehameha wanted to rule over all the islands that he should build a great *heiau* at Pu'ukohola at Kawaihae (Kamakau 1992:149 -150). The messenger to Kahekili threw down two *maika* stones, a black one and a white one. Kahekili asked if Kamehameha was coming to O'ahu to wage war and the messenger said yes. Kahekili then asked him where he would land. The messenger told Kahekili of the landing places that were advised and who advised Kamehameha. After commenting on each suggestion, Kahekili imparted a message for Kamehameha:

Go back and tell Kamehameha to return to Hawai'i and watch, and when the black tapa covers Kahekili and the black pig rests at his nose, then is the time to cast stones. Then, when the light is snuffed out at Kahiki that is the time to come and take the land (Kamakau 1992:150).

While on Moloka'i Kamehameha heard that his cousin Keoua Kuahu'ula, Ka' ū chief, had waged war on other chiefs of Hawai'i Island and had killed Keawe -ma'u-hili, the Hilo chief who had aided Kamehameha in the Maui battle, in spite of an agreement with Keoua that he wouldn't "fight the sons of Kahekili." Keoua took over Hilo then went on to Waipi'o where he destroyed the fishponds and plundered the taro patches and robbed the people from Waipi'o to Waimea, then went on to ravage Kohala. Kamehameha returned to Hawai'i Island from Moloka'i and proceeded to wage war on Keoua. Several battles later, both sides could not gain an upper hand. Although Keoua's warriors seized the muskets of Kamehameha, they didn't have the powder to make them work. It took an act of nature or the goddess Pele to turn the tide as Keoua's army was annihilated by a volcano eruption (Kamakau 1992:151 -152).

In the meantime, Ka -eo-kū-lani, ruling chief of Kaua'i and brother of Kahekili, heard what happened to his nephew Kalanikūpule on Maui and how they narrowly escaped death. He heard "how the waters of 'Āo had been choked with the bodies of the slain in this war." He was so upset that he decided to wage war against Kamehameha (Kamakau 1992:148, 159). The shift in style of warfare that Kamehameha started during the *Battle of Kepaniwai* in Wailuku, Maui continued.

[Ka'-eo-ku-lani] set out with [nephew] Pe'ape'a, son of Kamehameha -nui, his counselor of war, Ki'ikiki'i, Kai-awa, and chiefs, warriors, and paddlers, all well armed with muskets and weapons of all kinds, and with his two man-eating dogs. (He also took with him) Maka'eha and Mr. Mare Amara [foreigner], a man skillful in the use of arms who acted as his gunner (Kamakau 1992:159).

On O'ahu Ka'eo met up with his brother Kahekili, ruling chief of O'ahu, Maui, Moloka'i and Lāna'i and persuaded Kahekili to join him in the war against Kamehameha. Kahekili left his son Kalanikūpule in charge of O'ahu and left for Moloka'i.

The war party landed at Kaunakakai on Moloka'i, and when the Kaua'i chief saw for the first time, by the ovens they had left, the size of the camp which Kamehameha had occupied he said, "Where a big squid digs itself a hole, there crab shells are heaped at the opening." Upon their reaching Maui...the army camped at Wailuku and of Waiehu the Kaua'i chief remarked, "Here is the land of the warrior to whom Kamehameha owes his kingdom (alluding to Ke'eumoku whose wife Namahana, brought him the land of Waiehu).... Waiehu fell to Ki'ikiki'i and it was, alas! The

Kaua'i people who ate the poi of Waiehu.... Kahekili gave some of the land of Maui to the ruling chief of Kaua'i to be divided among his men.... This caused discontent among the chiefs of Maui, who had thus to lose some of their land, and they rose against the Kaua'i chief. A battle was fought at Paukukalo adjoining Waiehu while some of the people were out surfing (Kamakau 1992:159-160).

It is not clear what happened right after that battle because what follows is Kahekili leaving Maui with his warriors from Kaup ō, while Ka'eo sails for Hawai'i with his warriors from Hāna. However, they both land in Waipi'o and Ka'eo keeps his vow and "wantonly destroyed everything in Waipi'o" including the sacred places and the tabu threshold of Liloa...not even Keoua who has passed through there the year before and destroyed the land and the food, had made such wanton destruction" (Kamakau 1992:160). Kahekili in the meantime goes on to Halawa in Kohala where fighting occurs, then sails from Halawa and joins Ka'eo in Waipi'o. When Kamehameha hears about Ka'eo and Kahekili, he sails with John Young and Isaac Davis and meets up with Ka'eo and Kahekili at Waimanu cliffs. The battle of 1791 called *Kepuwaha'ula*, was a stand-off with loss to both sides. Kahekili left and returned to Maui (Kamakau 1992:161-162).

Kamehameha decided to take the advice of the Kaua'i *kahuna* Kapoukahi and build a *heiau* at Pu'ukohola. Kamehameha personally helped to construct the *heiau* Pu'u Koholā in the summer of 1791, to assure his victory over his cousin, Keoua Kuahu'ula, son of his father's older brother. Messengers were sent to Keoua to ask him to come to the *heiau* so that there would be peace between the cousins. Keoua left Ka' ū with a fleet of twenty-seven canoes. As he sailed into Kawaihae Bay at Mailekin i, Ke'eumoku thrust a spear at Keoua, which he dodged, snatched and thrust back. Suddenly muskets were fired from the shore, leaving Keoua and all the others from his canoe dead. The rest of Keoua's warriors were spared when Kamehameha declared the law of the broken paddle [ *Mamalahoa*] (Day 1984:77; Kamakau 1992:154-157).

Vancouver returned to Hawai'i Island in February 1793 to find all the chiefs wanting guns and powder. Instead he gave Kamehameha a bull and heifer from California and asked that all the chiefs stop fighting. In March he sailed to Lahaina and saw Kahekili who was now an old man. He also asked Kahekili to stop the fighting. Kahekili said that "it was not right for the chiefs of Hawai'i to raid Maui and rob and pillage without cause." He told Vancouver he should stay and guard him against further wars. Vancouver went on to O'ahu to see Kalanikūpule, then to Kaua'i before going to North America. It was the last time Vancouver saw Kahekili who died later that year at the age of eighty-seven, after becoming ill and returning to Waikīkī, O'ahu. His bones were carried by his twin brothers Ka -me'e-ia-moku and Ka -manawa and hidden in a secret cave in Kaloko, North Kona. His gods were Ku -ke-olo-ewa, Kuho'one'e-nu'u, Kalai -pahoa, Ololupe, Kameha'ikana, Kala -mai-nu'u, Kiha -wahine, Haumea and Wali -nu'u (Kamakau 1992:164-166).

On Vancouver's third visit to the islands in 1794, Kamehameha I was ruling chief of Hawai'i; Ka'eo was ruling chief of Maui, Moloka'i and Lāna'i; Kalanikūpule of O'ahu and Ka -umu-ali'i of Kaua'i. Then Ka'eo got tired of Maui and wanted to go back to Kaua'i. Not knowing what his uncle's plans were, Kalanikūpule prepared for war. A few skirmishes and reconciliations took place that year on O'ahu, but as Ka'eo prepared to embark to Kaua'i from West O'ahu he discovered a conspiracy among some of his chiefs, principally his two counselors Ki -kīkī and Kai-awa, who were planning to throw him overboard in mid-ocean. He decided it was better to die in battle, then alone in the ocean so he dismantled his canoe and proceeded to make war on Kalanikūpule. Ka'eo won a couple of skirmishes, but in the end was defeated in 'Aiea by Kalanikūpule who was aided by foreign vessels in Pearl Harbor, guarding the shores with guns and cannons. Ka'eo died in mid-December 1794 (Kamakau 1992:168 -169).

The captain and some of his crew of the foreign vessels were then tricked and killed. Kalanikūpule

confiscated the vessels and munitions with the intention of sailing to Hawai'i to overtake Kamehameha. Just one day out they all got seasick and had to return to Waikīkī with Kalanikūpule and his wife still on board. The foreigners sailed off during the night, but put Kalanikūpule and his wife aboard a canoe and let them go back to O'ahu. The foreigners then sailed for Hawai'i Island to tell Kamehameha what happened and to give him all the munitions on board (Kamakau 1992:170-171).

Demographic trends during the Proto-Historic Period indicate a population reduction in some areas, yet show increases in others, with relatively little change in material culture. There was a continued trend in craft and status material, intensification of agriculture, *ali'i* (chief) controlled aquaculture, upland residential sites, and oral records [*mo'olelo*] from that period were rich in information. The Ku cult, *luakini heiau*, and the *kapu* (restriction or regulation) system were at their peak, although Western influence was altering the cultural fabric of the islands (Kirch 1985:308, Kent 1983:13). By 1794 American, English, Irish, Portuguese, Genoese, and Chinese foreigners were living in the islands (Day 1992:23-25). Between 1778 and 1794 at least 21 ships from various countries had visited Kaua'i for provisions and to trade (Mills 1996:68).

### 3.2.5 Early Historic Period (1795-1900 AD)

The Early Historic Period (1795-1900 AD) is marked by very significant events. Kamehameha left Hawai'i Island in early 1795 and landed in Lahaina, taking over all the food patches and cane fields before leaving for Moloka'i where the "whole coast from Kawela to Kalama'ula was covered by canoes. There on Moloka'i he awaited for the proper time to sail for O'ahu, where the chiefs and warriors of Kalanikūpule were slaughtered.... In the *Battle of Nu'uaniu*, O'ahu, Moloka'i, and Lāna'i were conquered" (Kamakau 1992:170-171). Kamehameha took Keku'iapoiwa Liliha and Kalanikauiakea alaneo to O'ahu to witness this battle of Nu'uaniu Pali and the defeat of O'ahu. It was during this trip that Kalanikauiakea alaneo was given the name Ke'ōpūlani (Klieger 1998:21).

During this Early Historic Period, "between one hundred and two hundred foreigners lived in the islands.... Hardly a ship touched without leaving a deserter or two behind.... A white man automatically ranked as a chief, although he could not own land in fee simple or build a permanent house... [and] they took Hawaiian wives" (Day 1992:25).

In Hā'ena during the 1700-1800s, according to archaeological evidence, the population declines and intensive occupation ends (Major and Carpenter 2001:38). Although evidence of habitation at the back and east side of Kē'ē Bay is rather intense and in historic times visitors referred to a "village" at this location (Emory 1929; In Major and Carpenter 2001:39).

In 1802 and 1803, Kamehameha I and his court resided in Lahaina where he had a two-story brick house built (Alexander 1953:63). Lahaina became the capitol of the islands (except for Kaua'i). This was short-lived, however, as Kamehameha I moved to Honolulu in 1803 (Klieger 1998:22). In 1802 on the island of Lāna'i a Chinese man named Wong Tze Chun is believed to have been the first person to mill sugar cane (WSC 1962:7); he came to Hawai'i as part of the sandalwood industry. In 1803 the first horses landed in Hawai'i from California (WSC 1962:7).

Hawai'i's culture and economy continued to change radically as capitalism and industry established a firm foothold. In 1810, Kaua'i *ali'i nui* Ka-umu-ali'i ceded his kingdom of Kaua'i, Ni'ihau, Lehua and Ka'ula to Kamehameha (see more C-3) although Ka-umu-ali'i continued to have autonomy over the island. At this time the sandalwood trade in Hawai'i was flourishing; the Fijian and Marquesan supply of sandalwood was exhausted. Sandalwood came under the personal control of Kamehameha I, who had become "a fervent consumer of high-priced western goods." The sandalwood industry was thriving to the point where the subsistence levels declined, as farmers and fishermen spent most of their time logging,

causing famine to set in (Kent 1983:17-20). Hawai'i became known as "Tan Heong Shan" or the "sandalwood mountains" to entrepreneurs of Southern China, who first came as early as 1794 in search of this prized wood (WSC 1962:41).

Although white men from various countries stayed over in temporary houses, it wasn't until 1816 when a large structure (80 x 100 meters) was constructed, primarily under the supervision of employees of the Russian-American Company (RAC), on the eastern banks of the Waimea River; it was known as *Hippo* or *Fort Elizabeth*—made of stone and adobe apparently with the help of Kaumuali'i's wives and over 300 "native Hawaiians" (Mills 1996:145). Before its completion the employees of the RAC were expelled from the island; the fort was then completed by Kaumuali'i, who had "acquired one of the most important symbols of European power" (Mills 1996:149, 151). However, Kamehameha continued to exercise his suzerainty by collecting tribute from Kaua'i in the form of sandalwood, hogs and vegetables (Mills 1996:153).

On May 8, 1819, Kamehameha I died at Kamakahonu, Kailua, Hawai'i Island. Following his death, his son and heir Liholiho banished the *kapu* system at the advice of his queen mother Ke'ōpūlani and queen regent Ka'ahumanu (Kamakau, 1992:210, 222). On October 1819, seventeen Protestant missionaries set sail from Boston to Hawai'i. The missionaries arrived in Kailua-Kona on March 30, 1820, to a markedly changed culture; one with a "religious" void and a growing appetite for western products. They brought George Humehe, the 21-year old son of Kaumuali'i, who had been living in the United States since he was six or seven—sent there by his father so he could receive an education (Mills 1996:155). Humehe finally returned to Waimea, Kaua'i in May, 1820 where his father Kaumuali'i and the queen Debra Kapule, primarily resided. Kaumuali'i gave Humehe the district of Waimea, including *Hipo* (Damon 1925:205-206, In Mills 1996:160). Shortly after arriving Humehe married Betty, a daughter of Isaac Davis whom he met on Hawai'i Island (Mills 1996:163).

The missionaries quickly started missions on all of the islands, at the objection of the trading community (Mills 1996:158). In 1820 Lahaina was proclaimed the capital of Hawai'i; this lasted until 1845 (Wisecarver 1983:18) when the court moved to Honolulu. Ka'ahumanu, the *kuhina nui* of Kamehameha II (Liholiho) was not automatically a convert to Christianity, however, when she finally embraced it, it was with tremendous zeal. Missionary Bingham (1847:162) wrote an entry in his journal in 1822:

Kaahumanu with husband made tour of windward islands with a large retinue, including sister Namahana [II], her brother-in-law Laanui...and while on this pleasure-seeking tour, searched out and destroyed many idols. On the 4<sup>th</sup> of June, she sent for Kalaipahoa, the so-called poison deity, and caused it to be publicly burnt, with nine other images. On the 26<sup>th</sup> of the same month, one hundred and two idols, collected from different parts of Hawai'i, where they had been hidden 'in the holes of the rocks and caves of the earth,'... [were] committed to flames.

In 1821 Liholiho paid a visit to Kaua'i, intending to resolve the issue of his sovereignty over all the islands. Kaumuali'i met Liholiho (his cousin) at Waimea, making a pledge to him the same as he had done to his father; he offered Liholiho the fort, his vessels, his munitions and even the island. Liholiho told him to keep the island. But Liholiho did take one of Kaumuali'i's wives. After spending a couple of months on the island, Liholiho invited Kaumuali'i onto his ship. When they had settled on board, Liholiho gave his men a signal to set sail, thus "kidnapping" Kaumuali'i. Shortly after arriving back on O'ahu, Ka'ahumanu married her cousin, Kaumuali'i (Mills 1996:171-172) [her mother Namahana was the half-sister of his father Ka'eo]. Ka'ahumanu, then married one of Kaumuali'i's sons, cementing her position of power. Kaumuali'i died a few years later in 1824 (Mills 1996:173) never being allowed to see his Kaua'i family again.

In August 1824, after Kaumuali'i's death, a skirmish took place at Fort Elizabeth that included his oldest son George Humehe who was married to a daughter of Isaac Davis. He wanted revenge and felt that

his father had been poisoned. Kalanimoku had arrived to check on Kaua'i and was faced with some opposition. He sent back to O'ahu for reinforcements; they came led by Maui governor Hoapili, a former warrior and counselor to Kamehameha I from Hawai'i Island, whose warriors were more experienced and had more weapons. The rebel warriors, including George Humehume, held a position overlooking Hanalei Valley. They were subsequently outnumbered and defeated by the forces of Hoapili. George, with his wife and infant daughter fled to the mountains on horseback. They were later captured and shipped off to O'ahu, where he died two years later at age twenty-nine. Most of Kaua'i *ali'i* were dispossessed of their lands and sent to other islands and the Kaua'i lands were divided among the Hawai'i Island chiefs who appointed their own *konohiki* or land managers [e.g. Moku'ohai]. The *maka'āinana* on the lands were treated as conquered rebels (Joesting 1984:104 -111).

In the 1820s and 1830's other industries such as whaling, merchandising and sugar crept into Hawai'i. "For the first time Hawaiian masses were drawn to a cash economy as workers and producers." By 1825 most of the powerful chiefs/chieftains had become Protestant Christians. The first sugar plantation was established on Kaua'i in 1836 (Kent 1983:22, 23, 29). The 1840s heralded other changes as well. The Hawaiian government, with the aid of the missionaries, encouraged the sugar industry as well as other enterprises such as coffee, cotton, rice, potatoes, and silk worms (Speakman 2001: 93).

In the mid -1840s a political act of the Hawaiian Kingdom government would change forever, the land tenure system in Hawai'i and have far-reaching effects. The historic land transformation process was an evolution of concepts brought about by fear, growing concerns of takeovers, and western influence regarding land possession. King Kamehameha III, in his mid -thirties, was persuaded by his *kuhina nui* and other advisors to take a course that would assure personal rights to land. One -third of all lands in the kingdom would be retained by the king; another one -third would go to *ali'i* as designated by the king; and the last one-third would be set aside for the *maka'āinana* or the people who looked after the land [native tenants or *kuleana* lands]. In 1846 he appointed a Board of Commissioners, commonly known as the Land Commissioners, to "confirm or reject all claims to land arising previously to the 10<sup>th</sup> day of December, 1845." Notices were frequently posted in *The Polynesian* (Moffat and Kirkpatrick, 1995). However, the legislature did not acknowledge this act until June 7, 1848 (Chinen 1958:16; Moffat and Kirkpatrick 1995:48 -49), known today as *The Great Mahele*. In 1850, the Kingdom government passed laws allowing foreigners to purchase fee simple lands (Speakman 2001:91).

In 1846 there were only eleven mills in Hawai'i manufacturing sugar and molasses; two on Kaua'i, three on Hawai'i Island and six on Maui (WSC 1962:10). The whaling industry was at its peak between 1846 and 1860 with almost 600 ships reaching Hawai'i ports in one year. But the late 1850s saw a decline in the whaling industry with the discovery of oil in Pennsylvania, the Civil War, and the sinking of at least forty whale ships by the Union to block the harbors; as well as the early freeze in the Bering Strait in 1871 which trapped thirty -three ships. Although the crews escaped, five hundred Hawaiian sailors returned home penniless (Speakman 2001:88 -89).

Disease had a devastating effect on the population and the landscape, killing *ali'i* and *maka'āinana* alike; measles epidemics in 1848 and 1849, were followed by the horrendous smallpox epidemic in 1852-1853. Ten thousand people are said to have died of this disease in Hawai'i (Kamakau, 1992:411, 418). John Papa I'i in *Fragments of Hawaiian History* (1984) talks about the impact of this disease and as *kahu* or guardian of several young *ali'i*, he had to take several of them off of O'ahu island. They just kept sailing from island to island and usually were not allowed to land as O'ahu was thought to be the source of the smallpox.

Historic land records indicate that by 1850, there were several households scattered among the Hā'ena *lo'i*, a pattern that may have developed when *lo'i* were in fallow periods. A photograph ca. 1910 shows a Hawaiian family and their house located in the midst of the Kē'ē *lo'i* (Major and Carpenter 2001:39).

By 1858 at least 2,119 foreigners lived in Hawai'i. Many were merchants who traded with whalers, while the missionaries lived in various locations throughout the islands. The foreigners also included one hundred and eighty Chinese contract laborers from Hong Kong (Speakman 2001:109). Some "foreigners engaged in agricultural pursuits with the idea of reaping a profit from the land, in contrast with the Hawaiians, who carried on... subsistence agriculture" (Coulter 1971:11).

The U. S. Civil War of the 1860s brought about a boost for the sugar industry in Hawai'i as sugar plantations in the South were boycotted or destroyed (Speakman 2001:91 -96). The rise in the number of plantations brought about a radical change in both the population in general, and the number and ratio of foreigners to native Hawaiians. As more and more labor was needed to accommodate the expanding industry, plantations sought laborers from several countries.

Statistics...show that far from being unsuited to plantation labor, or considered inefficient workers, Hawaiian labor was considered the best obtainable by many planters. As late as 1869 some plantations employed Hawaiian labor exclusively.... "The true reason why there is a dearth of Hawaiian labor is the increase of the planting interests from some 2,000,000 of pounds in nine or ten years to 18 or 20,000,000, requiring from eight to ten times as many men now as then." This source found more Hawaiians employed in such labor than ever before, and statistics for that year (1873) showed that out of 3,786 laborers employed on thirty -five plantations, 2,627 were Hawaiian men and 364 were Hawaiian women.... Nevertheless, the population decline was palpable and became a matter of public concern for the kings and their advisors, of the Hawaiian legislature, and of the sugar planters.... Immigration of labor from China and Japan [filled] the population and labor gap...it was from these two countries that the largest contingents of immigrants came, though supplemented by Caucasians, including Portuguese, and Filipinos, Koreans, Puerto Ricans, Germans, Pacific Islanders and many others.... In that period the population rose from 55,500 in 1876 to 154,000 in 1900. The following table shows the changes in percentages (Speakman 2001:107-108):

Table 1. Ethnic Demographics of Hawai'i

|                          | 1876  | 1900  |
|--------------------------|-------|-------|
| Hawaiian & Part-Hawaiian | 89.2% | 26.0% |
| Caucasian                | 6.3%  | 17.5% |
| Oriental                 | 4.5%  | 56.5% |

The Overthrow of the Hawaiian Kingdom government in 1893 and the subsequent annexation to the United States in 1898 (Daws 1974:28 9-290) heralded even more radical changes to the Hawaiian culture and to the local landscapes.

### 3.2.6 Territorial History Period (1900-1949 AD)

In 1900 Hawai'i had a population totaling 154,000 of whom only 29,799 were pure Hawaiians, 7,857 part-Hawaiians and the rest of 116,244 consisting of many other races (Wisecarver 1983:13). This period saw Native Hawaiians running for Congress (Daws 1974 297); and much of the lands being sold in fee simple. The Organic Act was effective on June 14, 1900 and Hawai'i became a Territory of the United States; in 1901 the first Territorial Legislature convened and passed the first income tax law (WSC 1962:26). In the 1940s, World War II also had some lasting influence on lives and industries as young men left the islands by the hundreds, for the front lines abroad.

While the population of Hā'ena decreased between 1700-1800 and the land further modified by the 1946 tsunami, Hā'ena continued to be occupied until decades into the Modern History Period.

If the volcanic glass dates are correct and considering the several projects along the beach, Hā'ena saw Hawaiian beach front cottages until the early decades (c. A.D. 1930) of the present century,

and in fact intensive occupation until the raid and destruction of "Taylor Camp" in A.D. 1977 (Riley and Clark 1979, Riley and Ibsen-Riley 1979). Sporadic occupation on the beach continues, perhaps not unlike the earliest, some one thousand years ago ... Beach excavations and the Land Commission Awards testimonies (c. 1850) verify that Ha'e'na was never abandoned (Griffin 1984:3).

### 3.2.7 Modern History Period (1950-)

Post World War II brought about an influx of people and industries to Hawai'i, allowing the tourism industry and offshoot enterprises to flourish. Along with the rise of the tourism industry, and competing sugar markets abroad, the sugar companies saw a sharpening decline in business (the Sugar Acts of 1934 and 1937, and ILWU Strike of 1946 didn't help). 1950 marked the introduction of radiocarbon analysis which shifted the focus of study in archaeology to excavation as a primary method of data recovery, with a research focus on settlement patterns, subsistence, land and marine use. The 1950s and 1960s were the bleakest years for the sugar industry and it was becoming apparent that the sugar industry was beyond salvage (Kent 1983:107-108). More changes were soon to take place on the landscapes of Hawai'i.

In the 1960s, various federal and state environmental and historic preservation laws and regulations were passed, mandating surveys and impact studies of the landscape, prior to development. In 2000 Hawai'i Legislature passed an EIS amendment resolution which the governor signed as Act 50. This legislation has broadened the scope of environmental impact studies to include cultural impact studies to assure that traditional Hawaiian and other ethnic cultural practices are not adversely impacted, as vacant sugar fields give way to the ever-growing populations and expanding tourist and real-estate industries.

### 3.3.0 Traditional Literature

The ethnographic works of the late 19<sup>th</sup> and early 20<sup>th</sup> century contribute a wealth of information that comprise the traditional literature --the *mo'olelo*, *oli*, and *mele*--as well as glimpses into snippets of time, and a part of the Hawaiian culture relatively forgotten. The genealogies handed down by oral tradition and later recorded for posterity, not only give a glimpse into the depth of the Hawaiian culture of old, they provide a permanent record of the links of notable Hawaiian family lines. The *mo'olelo* or legends allow *ka po'e kahiko*, the people of old, the *kupuna* or ancestor, to come alive, as their personalities, loves, and struggles are revealed. The *oli* (chants) and the *mele* (songs) not only give clues about the past, special people, and *wahi pana* or legendary places, they substantiate the magnitude of the language skills of *nā kupuna kahiko* (the people of old).

#### 3.3.1 Genealogies

*Po'e ku'auhau* or genealogy *kahuna* (masters) were very important people in the days of old. They not only kept the genealogical histories of chiefs "but of *kahunas*, seers, land experts, diviners, and the ancestry of commoners and slaves.... An expert genealogist was a favorite with a chief." During the time of 'Umi (ca 1500-1600s) genealogies became *kapu* (restricted) to commoners, which is why there "were few who understood the art; but some genealogists survived to the time of Kamehameha and even down to the arrival of the missionaries" (Kamakau 1992:242).

Surviving genealogies illustrate that the ruling families of each island were interrelated quite extensively. The chiefs of O'ahu, Kaua'i, Hawai'i, Maui and Moloka'i had common ancestries. Families branched out, but conjoined several times in succeeding generations (Kamakau in McKinzie, 1983: xxv). Not only were the chiefs or *ali'i* related to each other, they were also related to the commoners. In *Ruling Chiefs*, Kamakau states that "there is no country person who did not have a chiefly ancestor" Kamakau (1992:4). In the following passage Kamakau (1992) explains how some of the *ali'i* were connected.

It is said that the chiefs of Hawai'i island were from Maui and from O'ahu and Moloka'i between the times of 'Aikanaka and Hanala'anui. Thus 'Aikanaka was the chief of Koali and Mu'olea in Hāna; Hema, the chief of Ka'uiki in Hāna; Kaha'i, the chief of 'Iao in Wailuku; Wahieloa, the chief of Papauluana in Kīpahulu. Laka the chief was born at 'Alae in Kīpahulu, Maui; he ruled in Ko'olaupoko, O'ahu; the site of his house, Hale'ula, was at Waikane, O'ahu. Lu'ani'u was born at Waimea, Kaua'i, and ruled that kingdom. Kamea was from Waikale, Ewa, O'ahu; Pohukaina was from Kahuku; Pau, that is Ka-pau-nui-kua-'ōlohe, was from Kea'au in Wai'anāe. Hua was from Lahaina, Maui...this is Hua the son of Kapua'i -manakū [Pohukaina] whose *heiau* was Luakona, near to Kap'ū'ulu. Huanuikalālā'ilā'i [son of Pau, that is Kapaunuikea'ōlohe] was born at Kawelo in Honolulu; Paumakua-a-Lonoho'oneua was born at Kua'a-'ohe, Ko'olaupoko, and rules there; Haho was born by the *kawa*, the leaping place, of Kua'ikua at the stream of Kua'ikua in Wahiawā. Palena [-i-Haho] was born on the hill of Ka'uiki in Hāna, at the site Hānanaikū; he ruled and died on O'ahu; his remains and also his stone are at Ka-lua-o-Palena in Kalihi on O'ahu. Hānala'a-nui and Hānala'a-iki were the twin sons of H'i-ka-wai-nui and Palena; they were born at Kahin'ihini'ula, at Mokae and Hāmoa, and a certain *moku āina* land was named after these boys. Lana-ka-wai [son of Hānala'a-nui] was born at the *kawa* of Kua'ikua in Wahiawā, O'ahu (Kamakau, 1991:101).

Malo (1971) also wrote about the connection between the *maka'āinana* and the chiefs. "Commoners and *ali'i* were all descended from the same ancestor, Wa'kea and Papa" (Malo, 1971:52). This is evident in the genealogies. Genealogies were very important to the chiefs, because ranking was very important. The genealogies not only indicated rank, they ascertained a link to the gods. The following excerpt explains the idea and importance of rank and the role of genealogies:

Position in old Hawai'i, both social and political, depended in the first instance upon rank, and rank upon blood descent—hence the importance of genealogy as proof of high ancestry. Grades of rank were distinguished and divine honors paid to those chiefs alone who could show such an accumulation of inherited sacredness as to class with the gods among men...a child inherited from both parents.... The stories of usurping chiefs show how a successful inferior might seek intermarriage with a chiefess of rank in order that his heir might be in a better position to succeed his parent as ruling chief...a virgin wife must be taken in order to be sure of child's paternity—hence the careful guarding of a highborn girl's virginity (Beckwith 1990:11).

One could defend and/or prove their rank by knowing or having one's genealogist recite one's genealogy. For the *kanaka maoli*, genealogies were the indispensable proof of personal status. Chiefs traced their genealogies through the main lines of 'Ulu, Nana'ulu, and Pili, which all converged at Wakea and Papa (Barrere, 1969:24). Two well-known genealogy chants are the *Kumuhonua* and the *Kumulipo* [ten main genealogy chants are known today (Josephides 2010)].

#### 3.3.1.1 Kumuhonua

The *Kumuhonua*, first published by Fornander in 1878 in *The Polynesian Race* Vol. I was based on information from Kamakau and Kepelino. Kumuhonua, the man, was of the Nanaulu line, and the older brother of Olopana and Mo'ikeha (McKinzie 1986:14-15). However, the birth chant *Kumuhonua* has been a subject of controversy (Barrere, 1969: i). Some of the *Kumuhonua* legends were recorded by Kamakau and Kepelino between the years 1865 and 1869, however, the 'genealogy' of the *Kumuhonua*, published by Fornander, was given to him "to provide credibility to the legends...this 'genealogy' (was) constructed from previously existing genealogies --the *Ōlolo* (*Kumuhonua*) and the *Paliku* (*Hulihonua*) which are found in the *Kumulipo* chant (see Beckwith 1951:230 -234) and interpolations of their own invention" (Barrere, 1969:1).

#### 3.3.1.2 Kumulipo

A better example is the famous creation chant *The Kumulipo*. Feher (1969) has several notable Hawaiian scholars write passages in his *Kumulipo: Hawaiian Hymn of Creation -Visual Perspectives by Joseph*

Feher. In the *Introduction* Momi Naughton states “The Kumulipo belongs to a category of sacred chants known as *pule ho’ola’a ali’i*, ‘prayer to sanctify the chief,’ which was recited to honor a new-born chief (Feher, 1969:1).

In her passage, Edith McKinzie states:

“The *Kumulipo* is a historical genealogical chant that was composed by the court historians of King Keaweikēkahiali’iokamoku of the island of Hawai’i about 1700 AD in honor of his first born son Kālani-nui-‘I-a-mamao. This important chant honors his birth and shows the genealogical descent of both the *ali’i* (chiefs) and the *maka ānana* (commoners) from the gods, in particular Wakea” (Feher, 1969:1).

### 3.3.1.3 Hawaiian Genealogies

Edith McKinzie completed the first volume of *Hawaiian Genealogies* in 1983, based on genealogy articles translated from 19<sup>th</sup> Century Hawaiian newspapers such as *Ka Nonanona* and *Ka Nūpepe Kū’oko’a* in the late 19<sup>th</sup> century and early 20<sup>th</sup> century. These articles were in response to a call to preserve the Hawaiian heritage. Some of the information came from Malo’s (1838) *Hawaiian History*, and in Fornander’s (1880), *The Polynesian Race* (Book I) (McKinzie, 1983:1).

Using thirty years to account for one generation, McKinzie determined that Wakea was born in 190 AD; Umi-a-Liloa in 1450 AD; Keaweikēkahiali’iokamoku in 1650 AD; Kālanihūiikupuapaikalanui Keoua in 1710 AD; and Kamehameha I in 1740 AD” (McKinzie, 1983:12). Volume Two of *Hawaiian Genealogies* was published in 1986 and consists of information extracted from genealogical lists published in thirteen Hawaiian language newspapers from 1858 to 1920. It compliments genealogies found in other works, such as Fornander’s (1880) *An Account of the Polynesian Race...* and David Malo’s *Hawaiian Antiquities* (McKinzie, 1986: v).

The following excerpt is from Kamakau’s article in *Ka Nūpepe Kū’oko’a* October 7, 1865, and was translated by McKinzie (1986). It illustrates some of the mid-19<sup>th</sup> century sentiment regarding genealogies:

To the commoners, a genealogy was of no value because their parents forbade (sic) it lest comparisons should occur and country children be born and rise up as chiefs. Therefore, the children of the commoners were not taught beyond father, mother, and perhaps grandparents.... To us, the people of this time, there is no value of this thing of a chiefly lineage; we have no great interest in it. But in our thoughts it is of great value. We have entered into discussion of it; the chiefs valued the chiefs and ancestors; and we also value our knowledge of it. Because it was forbidden to the commoners, they were not to know this. However, due to the rise of wisdom and skill of the children of the commoners, therefore, all of the ranking privileges were no longer restricted; it was only lifted. What remains of the ancestors is something of value (McKinzie 1986:18-19).

### 3.3.2 Mo’olelo

Legends, stories or *mo’olelo* are a great cultural resource as well as entertaining. Leib and Day (1979) state in their annotated bibliography of Hawaiian legends, that legends “are a kind of rough history.” They noted Luamala’s idea of the value of legend and myth in the serious study of a culture and her following quote. “To a specialist in mythology, a myth incident or episode is as objective a unit as an axe, and the differences and similarities of these units can be observed equally clearly and scientifically.” The following definitions of terminology, including the Hawaiian classification of prose tales –*mo’olelo* or *ka’ao*, come from their work (Leib and Day 1979: xii, 1):

|                  |                                                                                                                                                                                                         |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Folklore</i>  | a rather inclusive term, covering the beliefs, proverbs, customs, and literature (both prose and poetry) of a people                                                                                    |
| <i>Ka’ao</i>     | “pure fiction”                                                                                                                                                                                          |
| <i>Legend</i>    | deals with human beings and used interchangeably with ‘myth’... because the collectors and translators of the tales often failed to make the strict distinction                                         |
| <i>Mo’olelo</i>  | deals with historical matters and somewhat didactic in purpose... included tales of the gods, as well as tales of historical personages... many have recurring patterns, plots, and types of characters |
| <i>Myth</i>      | a story of the doings of godlike beings                                                                                                                                                                 |
| <i>Tradition</i> | used to refer to that which is handed down orally in the way of folklore                                                                                                                                |

### 3.3.2.1 History of Mo’olelo Collecting

According to Leib and Day (1979) a substantial number of legends were collected and written in Hawaiian, during the century following Cook’s arrival in Hawai’i. A few accounts of the mythology were printed in the journals of missionaries and travelers, and a few of the Hawaiian lore were printed in languages other than English.

### 3.3.2.2 Legends involving Hā’ena (HSPLS 1989: v1 and other sources)

|                                  |                                                                                                                                   |

### 3.3.3 Mo'ōlelo and Genealogy of Ali'i nui of Kaua'i

In the legends or *mo'ōlelo* collected by Fornander, Kamakau, Knudsen, Wichman and others, we can get a glimpse into the lives of some of the first settlers and *ali'i nui* or ruling chiefs of Kaua'i. Kaua'i was first settled by descendants of Kumu-honua and Lalo-honua thirty-six generations before Papa was born (Wichman 2003:2). The history of the Kaua'i *ali'i* begins in Waimea where according to Wichman (2003) the first settlers to Kaua'i landed generations before. From many of these *ali'i* one can understand why the genealogy of Hawai'i's chiefs and people on all the major Hawaiian islands share common ancestries. To reproduce any legend completely would take too long, therefore only excerpts are generally used for the following ancestors and descendants of the first *ali'i* of Kaua'i, who are said to be descendants of Papa and Wakea (second son of Kahiko and Kū-pūlana-kehau) (Wichman 2004:3) and their daughter Ho'ohoku-i-kalani.

#### 3.3.3.1 Papa and Wākea Progenitors of Kaua'i Chiefs

Papa and Wākea or Wākea and their daughter Ho'ohoku-i-ka-lani are said to be the progenitors of all Polynesians, however the islands were already populated when they arrived and settled in Nu'uuanu,

O'ahu. Hāloa is the name given to both sons of Wākea and Ho'ohoku-i-ka-lani. Kaua'i historians claim that a younger brother of Hāloa, Chief Ka-māwae-lua-lani-moku, son of Papa and Wākea, discovered and settled the island.

**Ka-māwae-lua-lani-moku & Kahiki-lau-lani** Chief *Ka-māwae-lua-lani-moku*...traveled to this island with his wife, *Kahiki-lau-lani*, and her two paddlers *Kō-nihinihi* and *Kō-nahenahe*. Because of his great deeds, the great number of his descendants, and the prosperity of his reign, people called the island Kau-a-i ("place of abundance").... Kaua'i is also the name of the youngest son of ancient voyager Hawai'i-loa. His wife was Wai'ale'ale, and her name was given to the lake beside the highest peak of the island. The word *Kaua'i* itself is older than Hawai'i-loa; it's true meaning is lost in the mists of the cosmic night from which Kaua'i's ruling chiefs descended (Wichman 2003:5).

Whether *Ka-māwae-lua-lani-moku* and *Kahiki-lau-lani* ever lived on Kaua'i is unknown. It is certain that one day, not too many generations after Papa and well before the descendants of Nana'ulu came to Kaua'i, a voyaging canoe commanded by *Kā'alu-nui-kini-ākea* [also spelled *Kā'alu-nui-kini-ākea*] approached the island from the west. Nothing is known of him except his name and that he had a son...and a counselor *Pi'i-ali'i* (Wichman 2003:5).

**Kū'alu-nui-kini-ākea and Kalaimoku Pi'i-ali'i** The first known settler to Kaua'i, *Kā'alu-nui-kini-ākea*, chose Waimea Valley for his new home. The shallow sea between Kaua'i and Ni'ihau teemed with fish, the river delivered fresh water and food, and even the climate was warm, ideal for growing crops, and comfortable to a people who wore a minimum of clothing.... The first settlers worshipped Kane, god of sun and fresh water, and thus all living things. The few *kānāwai* (laws) concerned the preservation of agriculture and marine resources. All ceremonies in the *heiau* (temple) were simple and the audience participated in all the rites. *Heiau* were built so that all priestly ceremonies could be seen by the assembled people who participated in the rites. From the beginning, there was a lack of distinction among the Kaua'i *ali'i* (chiefs). The rank of the mother determined in large part the rank of her child (Wichman 1998:67).

**Kū'alu-nui-paukū-mokumoku & the Menehune** *Kā'alu-nui-paukū-mokumoku* followed his father *Kā'alu-nui-kini-ākea* as *ali'i nui*. He sent back to his homeland for a people called *Menehune*, who were masters of stonework and engineering. The *Menehune* were an energetic, short but broad-shouldered, muscular people. They were organized in divisions based on their skills and work duties and were completely obedient to their leaders. They worked as a team and if a project was interrupted for any reason, they abandoned it and never returned to finish it. Under *Kā'alu-nui-paukū-mokumoku*, many *heiau*, fishponds, and irrigation systems for wet-land farming were built. These *Menehune* explored the island from one side to the other and left stories of their adventures in place-names that still remain (Wichman 1998:8).

**Kū'alu-nui-paukū-mokumoku, Ola and Kalaimoku Pi'i** The son of *Kā'alu-nui-paukū-mokumoku* was Ola. He opened the land between the ridges and the sea to agriculture. The land was considerably higher than the river, and separating the rich bottomland from freshwater was the cliff **Pali-uli**, "green cliff," which rose directly from the riverbed.... Ola gathered the *Menehune* and asked that an irrigation ditch be built around Pali-uli (Wichman 1998:8).... The ditch was called *Kā'ā-Ola*, "container acquired by Ola." The new farmland was named after their ancient homeland, *Pe'e Kaua'i*, "hidden Kaua'i" (Wichman 1998:9).

Like his ancestor Hawai'i-loa, Ola also contended with cannibalism. For several nights in a row, Ola and Pi'i noticed a bonfire flickering on the shores of Ni'ihau where no one lived. He asked his friend *Ka-hao-o-ka-moku*, who was about to set off on a fishing expedition to Ka'ula islet, to stop by Ni'ihau and find out who was there. Two days later Kāne-ōpa, the head *lawai'a* (fisherman) of the expedition, returned alone with a harrowing tale. As they landed on Ni'ihau, the fishing party had been greeted by a man who offered them food, shelter, and women. This unknown man had then shown them into a house where, tired from fishing, one by one they fell

asleep, all except Kāne-ōpa who was suspicious by nature and who had not liked the stranger's manner (Wichman 2003:13-14).

Kāne-ōpa was the only one to survive; he went back to Kaua'i and told Ola and Pi'i about the cannibals of Ni'ihau. They devised a plan and went back. Their plan worked and the cannibals were killed. "No mention of Ola's marriage or direct descendants has survived" (Wichman 2003:14).

### 3.3.3.2 Waimea and Wainiha Alliance

**Kā-la-kāne-hina and Lohipono** Sometime after Ola, *Kā-la-kāne-hina* became the *ali'i nui*. He lived at Lā'au-ōkala, the eastern point of the Waimea river outlet. He married Lohipono, a chiefess of Wainiha valley. She left her infant son *Kāne-a-Lohi* with her brother *Ka-lālā-pōpō'ulu*, a bird catcher who brought up his nephew in the mountains and trained him in the art of catching birds whose feathers were greatly prized (Wichman 2003:14).

**Kāne-a-Lohi** Kāne-a-Lohi exasperated his uncle a great deal, for he refused to eat most kinds of food and always demanded the flesh of small birds. To feed this prodigious appetite, *Ka-lālā-pōpō'ulu* moved to the cliffs above Halulu waterfall on the very edge of the immense cliffs of Wai'ale'ale. Here *uwā'u* (dark-rumped petrel) nested in deep holes dug into the sides of the cliffs. Each morning the *uwā'u* flew out to sea and each evening they flew home to their caves. The young...are good to eat (Wichman 2003:14).

A giant, *Ka-wai-pe'e*, from Pe'ape'a above Hanapēpē liked destroying the nests and killing the birds and throwing them away. *Kāne-a-Lohi* and his uncle set a trap for the giant and killed him as he came after a distressed bird. However, the Waimea chief *Kā-la-kāne-hina* also heard that men were eating his favorite *kapu* birds and set out for the mountains to catch and kill them. But *Kāne-a-Lohi* and his uncle destroyed his army and would have killed him too. But *Kā-la-kāne-hina* called out "Save me, in the name of your mother, Lohipono. I am your father." *Kā-la-kāne-hina* returned to Waimea and built a house and invited his son. They suspected a trap when all the chiefs' men were sitting in a circle next to the wall while the mat in the middle of the room sagged. *Kāne-a-Lohi* barred the door and a rush to get out the chief and his men fell into the hold. *Kāne-a-Lohi* then set the house on fire. *Kāne-a-Lohi* became *ali'i nui* for a short time, married and had a son *Ka-lau-lehua*. He later took his mother and son back to the mountains he loved (Wichman 2003:15-16).

**Ka-lau-lehua** *Ka-lau-lehua* later became *ali'i nui*. For reasons not mentioned in the legends, *Ka-lau-lehua* wanted to dig a ditch leading from Wai'ale'ale to the cliff's edge so that the pond would be the headwaters of the Wailua River. *Ka-lau-lehua* sailed to the mythical island of *Kāne-huna-moku* to fetch the *Mū-ai-mai'a* (banana-eating people). He tricked four *Mū* men and three *Mū* women into coming with him from their homeland to build his ditch. They refused and asked to be returned home. *Ka-lau-lehua* wouldn't help them, instead he imposed a *kapu* forcing them to live in the Alaka'i swamp. They planted bananas wherever they found a suitable spot and slowly they grew in numbers. They were a shy people and even though they lived in the same area as the Menehune, they avoided them too, but watched unhappily as the Menehune sailed away from Kaua'i. The *Mū* had lost their knowledge of the stars that could lead them back to their homeland (Wichman 2003:16-17).

**Ka-iki-pa'a-nānea** Several generations later [after *Ka-lau-lehua*], *Ka-iki-pa'a-nānea*... became the *ali'i nui* of Kaua'i. His headquarters was on the small plateau on the eastern side of the Waimea river mouth. *Ka-iki-pa'a-nānea* had two major passions: sports and riddles. He was a champion wrestler and boxer who always tried to kill his opponent. Everyone feared and hated him...only his personal servant, *Kūkae'a* was ever in his company.... Worst still when every chiefess on Kaua'i refused to marry him after the death of his wife, *Ka-iki-pa'a-nānea* sent his messengers to O'ahu, ordering them to bring him a wife (Wichman 2003:1718).

### 3.3.3.3 Puna Chieftdom and Interisland Ali'i Nui Connections

*Ka-iki-pa'a-nānea's* men kidnapped *Mākolea* who was surfing at Waikīkī and took her back to Kaua'i where she too refused to marry him. So he locked her up until a time when she would agree. *Mākolea* was already married to a *Māui* warrior *Ke-paka-ili-ula*. He sailed to Kaua'i and befriended *Kūkae'a*. Eventually *Kūkae'a* gave him the answers to the riddles. *Ke-paka-ili-ula* challenged *Ka-iki-pa'a-nānea* to a boxing match, which he won and answered the riddles correctly. He then seized *Ka-iki-pa'a-nānea* and tossed him into a firepot. Earlier *Ka-iki-pa'a-nānea* had been so preoccupied with his riddles and athletics that he had allowed an ocean-traveler from Marquesas, *Puna-nui-ka-ia-āina* to settle with his entourage on the banks of the Wailua river where the Menehune had constructed their temples. Now there were two chieftdoms on Kaua'i - Puna and Kona (Wichman 2003:18-19).

**Nana'ulu and 'Ulu** More than three hundred years after *Papa-hānau-moku* and *Wākea*, a chief from Tahiti, *Ki'i* and his wife *Hina-kō-ula*, became parents of two sons, *Nana'ulu* and *'Ulu*. When they were grown *Ki'i* asked them to go on voyages of discovery.... *Nana'ulu* sailed north in his canoe named *Manō-nui* (Great Shark) and found the islands of Hawai'i...voyagers came in increasing numbers. Meanwhile the descendants of *'Ulu* spread out over the South Pacific. Among them were extraordinary people who lived such wonderful adventures that storytellers had rich material to develop into entertaining sagas [e.g., *Maui*, *Aikanaka-a-Mako'o*, *Puna & Hema*, *Kaha'i & Wahioloa* and *La'ka*].... There were so many astonishing ancestors like these that the genealogists added them all into the *'Ulu* genealogy. Today there seems no way to reconcile the short *Nana'ulu* and very long *'Ulu* genealogies (Wichman 2003:20, 23).

**Puna-nui-ka-ia-āina and Puna-kai-ōlohia** Two voyaging canoes set out from Tahiti fifteen generations after *Nana'ulu* and arrived on O'ahu and Kaua'i. *Maweke* and *Paumakua* settled peacefully on O'ahu and quickly became ruling chiefs of a district of that island. At that same time, *Puna-nui-ka-ia-āina*, whose genealogy has not survived, arrived on Kaua'i, having come, most likely from the Marquesas Islands. *Puna-nui-ka-ia-āina* arrived when the chief with the deadly riddles, *Ka-iki-pa'a-nānea*, was ruler of Waimea.... *Puna-kai-ōlohia* followed his father... as leader of his people along the banks of Wailua. Nothing is known of him or his reign, except that he had a son [**Puna-ai-koā-i'i**].... *Puna-ai-koā-i'i* had only one child, his daughter, *Hina-ulu-ā*...they called her *Ho'oiipo-malanai* (*sweetheart of the gentle breeze*) (Wichman 2003:23-24).

**Puna-ai-koā-i'i, Hina-ulu-ā and Mo'ikeha** *Puna-ai-koā-i'i* (Puna) urged his daughter to marry, but she couldn't choose from the many suitors who came to court her from many islands - they were all equal to her. Finally Puna and his *kahuna nui* devised a plan --a contest of strength and speed. A *lei palaoa* would be taken to *Ka'ula* island and the first chief to retrieve it would win her hand. All were pleased with the contest rules. Then on the evening of the contest a stranger arrived in a voyaging canoe on the shores and said he was *Mo'ikeha* and asked to participate in the contest. The competing chiefs said as long as he could recite his genealogy and that it was equal to theirs. *Mo'ikeha* chanted his own genealogy: "*Nana'ulu* the husband, *Ulukou* the wife...*Kekupahaikala* the husband, *Maihihea* the wife; *Maweke* the husband, *Naiolaueka* the wife...*Muli-ele-ali'i* the father, *Wehelani* the mother, *Mo'ikeha* the man, *Hina-ulu-ā* the wife." Everyone enjoyed the boast and the chiefs agreed to his participation (Wichman 2003:23-24).

The names of these chiefs' names and places of residence is slightly different according to Kamakau's (1991) version:

The chiefs of Kaua'i who lived at *Kapa'a* while *Mo'ikeha* was living there were **Puna-nui-kai-anaina**, **Puna-kai-ōlohe**, and **Puna-ai-koā'e**. A beautiful daughter of the Puna chiefs, *Ho'oiipo-i-ka-malani* - also called *Hina-ulu-ā* - lived at *Waimahanalua* because of the excellence of the surf of *Maka'iwa* there *Mo'ikeha* took her to wife, and they were united in a lasting union. When their oldest son was born *Mo'ikeha* gave him the name *Ho'okamali'i* for the skin of *'Olopana*

[Mo'ikeha's older brother]. Their second son he named Haulani-nui-ai-ākea for the eyes of 'Olopana, and their third son he named Kila for Lu'ukia, the wife of 'Olopana (Kamakau 1991:106).

**Mo'ikeha, La'amaomao and Haulani -nui-ai- ākea** Mo'ikeha's companion was La'a-maomao, his foster son and owner of a large calabash which contained all the winds of the world. Mo'ikeha was able to use the winds and beat the other contestants and win the hand of Hina -'a-ulu-ā. Later Mo'ikeha's youngest son went back to Raiatea to bring La'a -maomao to see Mo'ikeha before he died. La'a [also called La'a-mai-Kahiki because he came from Kahiki] went to O'ahu where he sired three sons by three different chieftesses at the requests of the *kahuna* of Kualoa, as La'a was a descendant of Paumakua and they were afraid this line was dying out.

According to Kamaka'u (1991) "La'a-mai-Kahiki became an ancestral chief of chiefs and commoners of O'ahu and also for Hawai'i and Kaua'i. You will find his chiefly descendants in the *mo'o kū'auhau* of Nana'ulu, Puna-i-mua, and Hanala'a-nui" (Kamakau 1991:110).

Mo'ikeha's three sons went different routes; the oldest son Ho'okamali'i became the ruling chief of Kona, O'ahu; the second son Kila went to Waipi'o on the Big Island [Kila later went to Kahiki]; and the youngest son Haulani -nui-ai-ākea stayed on Kaua'i where he became the *ali'i nui* after the death of Mo'ikeha (Wichman 2003:23-35).

### 3.3.3.4 Kona and Puna Conflict

**Haulani-nui-ai-ākea, Ke-oloewa-a-Kamaua and Ka'ili -lau-o-ke-koa** Haulani-nui-ai-ākea was not a good chief so he was dethroned by Ke-oloewa-a-Kamaua a Moloka'i chief married to one of Maweke's granddaughters. However Ke-oloewa-a-Kamaua refused the throne and Kila was sent for in Raiatea, but he too refused wishing to stay with his [foster] brother La'a -mai-Kahiki. Ka'ili-lau-o-ke-koa, a granddaughter of Mo'ikeha was asked to rule and to marry *Ke-li'i-koa*, a Kona, Kaua'i chief. However, she fell in love with someone else of Puna, Kaua'i. This created a rift between Puna and Kona. Ka'ili-lau-o-ke-koa's husband died after a few years and Ke-li'i-koa invaded Puna and the two armies fought at Kuamo'o ridge. With the help of the women, the Kona chief was killed and the army defeated. Ka'ili-lau-o-ke-koa died childless and the chieftdom of Puna was offered to Ahukini -a-La'a, a son of La'a -mai-Kahiki (Wichman 2003:36-39).

**Ahukini-a-La'a, Kama-hano and Lu'anuu** Ahukini-a-La'a...and Ha'i-a-Kama'i'o had a son, Kama-hano. Kama-hano lived with Ka'-auca-o-ka-lani...they had a son, Lu'anuu. It was at this time that the first warrior hero of Kaua'i appeared. The war between Kona and Puna flared up (Wichman 2003:40-42).

**Akua-pehu-'ale** Akua-pehu-'ale of Kona swept ashore at Wailua and the surprised Puna chiefs fled for the uplands. Akua-pehu-'ale was considered a *kupua*, a supernatural being who could take two forms...that of a man and that of a giant sea monster. He was greatly feared and hated even by the men on his side. Once he vanquished the Puna forces he settled at the seashore (Wichman 2003:42).

**Ke-āhua, Ka-uhao, Lepe-a-moa and Ka-u'i-lani** One of the exiled [Puna] chiefs, Ke-āhua, found refuge in a remote valley in the Wailua uplands, which today bears his wife's name, Ka-uhao, daughter of Hono'u Iuli and Ka-pā-lama of O'ahu. Their first child was Lepe-a-moa, a *kupua*, who could take the form of a beautiful woman or a...feathered chicken. She was taken at birth to be raised by her O'ahu grandparents. Shortly after their defeat, Ka-uhao gave birth to a son...named Ka-u'i-lani (Wichman 2003:42).

When Ka-u'i-lani grew up he became a great warrior and defeated Akua -pehu-'ale. After the victory feast he led the Puna people back down to the mouth of Wailua (Wailua -nui-hāno) river. He later sailed for O'ahu to find his sister, Lepe-a-moa whom he had never seen (Wichman 2003:42-44).

**Lu'anuu and Palila** Lu'anuu, grandson of Ahukini -La'a, was named after the grandfather of Ki'i, father of 'Ulu and Nana'ulu. He was a good chief and was greatly admired in spite of the continuing wars with Kona - references to him indicate a close relationship to Kona. During the time of Lu'anuu there was a great warrior named Palila, son of Ka -lua-o-pālena and Maihi-iki. He was taken at birth and raised by his grandmother Hina in a sacred temple of Alana -pō where he was trained very well. Later he helped his father defeat Kona chief Ka -maka-o-ka-lani on the plains of Kōloa. Shortly after, a messenger from the ruling chief of O'ahu arrived asking for Palila's help. Palila had many adventures on O'ahu and Hawai'i and later became the ruling chief of Hilo (Wichman 2003: 44-47).

### 3.3.3.5 Merge of Puna and Kona Chiefdoms

**Kūkōna, Makali'i -nui-ku-a-ka-wai-ea, Mano -ka-lani-pō and Palekaluhi** Kūkōna [son of Lu'anuu] inherited an island at war and left it united as one kingdom. From then on, the legends of the Kona kingdom were seldom told and the genealogies of the first settlers were forgotten.... Kūkōna's *ali'i wahine* was Lau-puapua-ma'a and they had twin sons, Mano -ka-lani-pō and Palekaluhi. When Kūkōna became *ali'i nui* of Puna, the Kona chief was Makali'i -nui-ku-a-ka-wai-ea. He had been at the royal court of O'ahu for many years and several times had fought in battles against Kama-pua'a.... Makali'i-nui-ku-a-ka-wai-ea had been sent by Kama-pua'a to the royal court with the bad news of defeat. Eventually Makali'i-nui-ku-a-ka-wai-ea returned home to Waimea and organized his own force. Makali'i-nui-ku-a-ka-wai-ea's army included the father and older brother of Kama-pua'a (Wichman 2003:47-48).

**Kama-pua'a, Limaloa, Kūkōna and Makali'i -nui-ku-a-ka-wai-ea** The Kona and Puna armies met at Kōloa Gap and the war became a stalemate until Limaloa and Kama -pua'a joined the Puna army. Limaloa was a giant and had become friends with Kama -pua'a when he first came to Kaua'i. Kama-pua'a dared Limaloa and Kūkōna to join him in one-to-one combat against any Kona champions. Kahiki -'ula of Kona was the first to step forward and was struck down by Kūkōna, but as he was going to give the finishing blow Kama-pua'a stopped him and said he would finish the job and to go and look for other opponents. Instead of killing the man, he whispered to Kahiki -'ula, who was his father, to go back to his family in Kalalau. Limaloa was engaging another warrior, Kahiki -honua-kele, whom Kama -pua'a recognized as his older brother. When Limaloa struck him down, Kama -pua'a told Limaloa he would finish up. Instead he whispered the same thing to his brother. Then Kama-pua'a faced Makali'i -nui-ku-a-ka-wai-ea who did not recognize his former enemy. Kama-pua'a chanted a list of all the warriors he ever defeated and when he was done Makali'i -nui-ku-a-ka-wai-ea replied that he was defeated (Wichman 2003: 48-49).

**Puna and Kona merger** The two kingdoms were merged into one with Kūkōna as the *ali'i nui*. To cement the new situation, Nae -kapu-lani, the daughter of Makali'i -nui-ku-a-ka-wai-ea, was married to Kūkōna's son Mano-ka-lani-pō. Meanwhile, on the island of Hawai'i, Ka -lau-nui-o-Hua dreamed that his hand was possessed by the god Kāne-nui-ākea...he dreamed that he would become the ruler of all the islands (Wichman 2003:49).

**Kūkōna and peace in the islands** Ka-lau-nui-o-Hua successfully defeated Maui's Ka-malu-o-Hua, Moloka'i's Ka-haku-o-Hua and O'ahu's Hua-i-pou-leilei. He took the three chiefs with him on his invasion of Kaua'i where they landed at Māhāulepu, Pā'ā and Weliweli with no opposition. What he didn't know was that Kūkōna knew of the invasion as the guardian watchers of Hā'upu had seen the fleet as it left O'ahu. Kūkōna ordered everyone to leave their homes, take all their food with them, and go to the center of the island. He had all of his warriors hide among the trees on all the ridges overlooking

Māhāulepu to Lāwā'i. He also ordered every canoe on the island to gather at Hanapēpē Bay. K ūkona surrounded the invaders by land and by sea. By nightfall K ūkona had all the rulers of the major islands as his prisoners. He took his prisoners on a tour of the island and while taking a nap had a dream that three of the four rulers tried to plot his death , but Ka-malu-o-Hua of Maui rejected the plan saying that K ūkona had been good to them instead of killing them all and taking over all the islands. K ūkona woke up to discover that his dream was true, but instead of putting them to death he said he only wanted peace. He freed the rulers except for Ka -lau-nui-o-Hua whom he kept for ransom, and made them swear that they or their descendants would never invade Kaua'i again. K ūkona ordered the *heiau Ka-umu-o-Hua* built near Alaka'i swamp and it was here that the rulers all swore to uphold their promise not to invade Kaua'i. This peace was called *Ka-lai-loa-ia-Kamaluohua* (The Long Peace of Kamaluohua), which lasted over five hundred years. The royal court was kept at Wailua, but a permanent home was also maintained at Waimea (Wichman 2003: 49-52).

### 3.3.3.6 Ali'i Nui and Hā'ena Connections

**Golden Age of Mano-ka-lani-pō and Nae-kapu-lani** The reign of Mano -ka-lani-pō was considered the “Golden Age” because it was so peaceful that warriors became athletes and people lived to an old age. Mano-ka-lani-pō and Nae-kapu-lani had three sons: Kau -maka-a-Mano, Nā-pu'u-a-Mano and Ka -ha'i-a-Mano. During the reign of Mano -ka-lani-pō, he eventually allowed the *Mū-ai-mai'a* people to return to their homeland, Kāne-huna-moku, which was seen by their *kilo kilo* offshore of Miloli'i valley. They left Kaua'i as the *Menehune* before them had done , from Hā'ena. Also during his reign, three goddess sisters came to Kaua'i from the west after visiting Nihoa, Necker and Ni'ihau, in huge voyaging canoes from their homeland in Sāmoa; Kapō-ula-kinau, who was the first to arrive on Kaua'i, followed by Pele and Hi'iaka-i-ka-poli-o-Pele. Kapō-ula-kinau married off some of her women attendants to the men of Kaua'i, such as Limaloa the giant and Kau -maka-a-Mano, son of Mano -ka-lani-pō, then she left Kaua'i in search of a husband for herself. Pele also landed at Mānā, seeking a new home and safety from her sister Nā-maka-o-ka-ha'i. As Pele toured the island she met Kama -pua'a and they traded insults. Kama -pua'a tried to rape Pele, but she was saved by her sister Kapō-ula-kinau. Pele then went on to K ūē, Hā'ena where she met Lohi'au, the brother of Limaloa [warrior who fought alongside K ūkona and Kamapua'a against Kona forces], and fell in love with him (Wichman 2003: 55-59).

**Kau-maka-a-Mano** Kau-maka-a-Mano reigned after his father Mano -ka-lani-pō died. He married Kapō-inu-kai and they had only one child, Ka -haku-a-Kāne. Nothing was known of the other sons of Mano-ka-lani-pō, Nā-pu'u-a-Mano and Ka -ha'i-a-Mano. Ka-haku-a-Kāne was named after one of the four sons of Mo'ikeha, the voyager from Ra'iātea (Wichman 2003: 59-61).

### 3.3.3.7 More Ali'i Nui Interisland Travels and Marriages

**Ka-haku-a-Kāne** Ka-haku-a-Kāne, like so many of his ancestors, made a grand tour of the windward islands. He was...*ali'i nui* of Kaua'i and had an impeccable genealogy. When he reached Maui, Kapō-nae-nae, sister of the ruler, the first Kahekili married him [Kahekili I was married to Haukanuimakamaka or Haukanimaka , a Kaua'i chiefess and was father of Kawaokohele and Keleanuinohoanaapii who married the O'ahu *ali'i* Kalona, son of Ma'ilukukahi; Kahekili I was the grandfather of Pi'ilani]. They had two children, Kahekili-a-Kāne and Kū-o-nā-mau-a-ino. When Kahekili-a-Kāne's granddaughter married Lono-a-Pi'i, the *ali'i nui* of Maui at that time, Maui chiefs were able to connect themselves to the ancient Kaua'i line leading backwards to La'a-mai-Kahiki. When Ka-haku-a-Kāne left Maui and returned to Kaua'i, he married Mano -kai-ko'o, like himself a grandchild of Mano -ka-lani-pō. They had a son, K ū-walu-paukū-moku (Wichman 2003: 61-62).

**Kū-walu-paukū-moku** His name indicates that the genealogy of the Kona kingdom had not been lost before this time. He was named after an ancestor, the son of K ū-walu-kini-akua, the first

settler on Kaua'i. This Kū-walu genealogy had been joined to that of La -a-mai-Kahiki when Kū-walu-paukū-moku's great-grandfather Mano -ka-lani-pō married Nae -kapu-lani, daughter of Makali'i-nui-kū-a-ka-wai-ea, last ruling chief of Kona. Kū-walu-paukū-moku was a good, wise, and liberal ruler ...married Hame-a-Waha'ula, a chiefess whose genealogy has been lost.... Waha'ula was the first *heiau* built by Samoan priest Pā'ao after he made his first landfall in the district of Puna on Hawai'i island.... Pā'ao left his homeland and brought his god Waha'ula to Hawai'i.... Within Waha'ula's enclosure was a sacred grove of trees said to contain one or more specimens of every tree growing on all the Hawaiian Islands. One of these trees was a *hame*, a medium-size tree with grapelike clusters of sour, but edible fruit used to dye tapa; its hard wood was used for anvils for beating *olonā* fiber (Wichman 2003: 62-63).

**Ka-haku-maka-paweo and Ka-haku-a-kukua-ena** There are no legends concerning the quiet and peaceful rule of Ka -haku-maka-paweo.... His wife was Ka-haku-a-kukua-ena, of whom nothing is known, although the name indicates they must have been closely related. They had three sons: Kaile -lālāhai, 'A'a-nui-kani-a-weke, and Ka -lani-kukuma. Nothing is known of the two older brothers (Wichman 2003: 63).

**Ka-lani-kukuma, Kū-a-Nu'uau and Pāka'a** During the time of Ka -lani-kukuma, two Kaua'i heroes, Pāka'a and Pikoi-a-Alalā lived, and their adventures became popular tales of the storytellers. When Keawe-nui-a'Umi, son of 'Umi-a-Liloa of Hawai'i, was born he was placed in the care of Kū-a-Nu'uau who was entrusted as the *kahu* (guardian) to raise and educate the royal youngster.... Kū-a-Nu'uau became the close advisor of his chief.... After many years, Kū-a-Nu'uau toured all the islands, leaving his charge behind. Kū-a-Nu'uau eventually came to Kapa'a where he met La'a -maomao, a descendant of the navigator of the same name who had helped Mo'ikeha, the traveler from Ra'iātea, win his wife many years before. La'a maomao had inherited the calabash of winds as well as the name of her ancestor. K ū-a-Nu'uau and La'a -maomao settled down on a bluff overlooking the sea between Kapa'a and Ke'elia. After six months, word came from Hawai'i that Keawe-nui-a'Umi wanted Kū-a-Nu'uau to return and take up his duties once again. Before he left Kapa'a, K ū-a-Nu'uau gave his pregnant wife a white *malo* and a cape woven of *kahukalu*, a grass that grew only at Kapa'a.... After Kū-a-Nu'uau left, La'a-maomao and her brother Ma'ilou, a bird catcher, raised her son. His name was Pāka'a.... When K ū-a-Nu'uau died, Pāka'a took his place as the favorite friend of Keawe -nui-a'Umi (Wichman 2003: 63-64).

**Ka-haku-maka-lina and 'Ili -hiwa-lani** The wife of Ka-lani-kukuma was Kapo-lei-a-kuila, a direct descendant of Haulani-nui-ai-ākea, the oldest son of the seafaring Mo'ikeha. This union of the two lines after ten generations increased the *mana* and aristocratic rank of their two sons, Ka-haku-maka-lina and 'Ili-hiwa-lani. Ka-haku-maka-lina became the *ali'i nui* after his father, but within a few generations, the *ali'i* of Kaua'i successfully searched for a ruler among the descendants of 'Ili-hiwa-lani. Unknown and unannounced to...Ka-haku-maka-lina, a well-known chief of Hawai'i island, Lono-i-ka-maka-hiki, arrived on Kaua'i. He had just defeated Kama-lāla-walu of Maui...Lono-i-ka-maka-hiki landed at Waimea.... [Later] Ka-haku-maka-lina made a grand tour of the windward islands. Everywhere he was greeted warmly. When he reached the island of Hawai'i, he was feted by 'Akahi-ili-kapu, a daughter of 'Umi-a-Liloa. When it was time for him to return home 'Akahi-ili-kapu sailed to Wailua with Ka-haku-maka-lina. There she gave birth to two children, Ke -li'i-ohiohi, a son, and Koihalauiwailua, a daughter. 'Akahi -ili-kapu returned to Hawai'i with her children, and eventually they married into the Hawai'i *ali'i* line, thus adding the Kaua'i genealogical mana to the descendants of 'Umi-a-Liloa. (Wichman 2003: 67-70).

**Kama-kapu, Kā-kuhi-hewa and Ka -hā-malu-ihī** Ka-haku-maka-lina also married Ka -haku-mai'a, a Kaua'i chiefess, whose name indicates that she too was a descendant of Ka-haku-maka-paweo. They had a son, Kama-kapu. [Kama-kapu married Pā-wahine and they had Kawelo-mahamaha-i'a.] When Kama-kapu became *ali'i nui* of Kaua'i, the ruler of O'ahu was Kā-kuhi-hewa, who had earned a fierce reputation as a warrior, statesman, and keeper of the most glorious court in all the islands. By this time he was an old man. For his fourth wife, he chose a young Kaua'i chiefess, Ka-hā-malu-ihī. She had an impeccable genealogy descending, on her mother's side, from 'Ili-hiwa-lani, second son of Ka-lani-kukuma. From her father, Kawelo-ehū, she was a direct descendant of Ahukini-a-La'a, this

giving her a double -looped genealogy, making her *mana* the strongest on Kauaʻi. She owned three powerful *kumukānāwai*... Ka-hā-malu-ʻihi came from the sacred sands of Waimea... and her lands there became a *puʻuhonua* (place of refuge) for those who had broken her laws (Wichman 2003: 70-71).

### 3.3.3.8 Kauaʻi - Oʻahu Aliʻi Nui Merge

**Ka-hā-malu-ʻihi and Kūaliʻi** Kā-kuhi-hewa died shortly after his marriage to Ka-hā-malu-ʻihi, then she married Kāne-kapu-a-Kā-kuhi-hewa, his son. They had Ka-hoʻowaha-o-ka-lani. Her great-grandson Kūaliʻi later became *aliʻi nui* of Oʻahu (Wichman 2003: 71) and Kauaʻi.

**Kawelo-mahamaha-iʻa and Ka-pōhina-o-ka-poko** It was Kawelo-mahamaha-iʻa, son of Kama-kapu and Pā-wahine, who made the fateful decision to create once again a child who bore the *niʻaupiʻo* rank.... Kawelo-mahamaha-iʻa and his wife Ka-pōhina-o-ka-poko had six children. Their last two were a boy, Kawelo-maka-lua, and a girl, Ka-ʻāwhi-a-ka-lani, both still young and still virgin.... As soon as it was possible, the youngsters were mated (Wichman 2003: 73).

**Kawelo-peʻe-koa, Kawelo-ʻai-kanaka and Kawelo-lei-makua** When Ka-ʻāwhi-a-ka-lani felt the first pangs of labor she was taken to the sacred enclosure of Holoholokū [birthing stone in Wailua, built by Puna chief for Moʻikehaʻs first child]. Ka-ʻāwhi-a-ka-lani had twins; her first born, Kawelo-peʻe-koa was taken by the priests to be raised in seclusion as the supreme *aliʻi kapu*. The second born was Kawelo-ʻai-kanaka, who was raised to be a ruler. As the children grew, the island prospered under Kawelo-mahamaha-iʻaʻs rule and peace prevailed. Kauaʻi became an island of plenty and its hospitality was renowned throughout the islands. Kawelo-mahamaha-iʻa had two *luakini heiau* constructed in Anahola where human sacrifices were offered. Ruins began to grow that Kawelo-mahamaha-iʻa was part shark and as deaths continued and sacrifices grew, fear turned into anger. One day as Kawelo-mahamaha-iʻa traveled back from Anahola he was stoned to death. Kawelo-maka-lua, father of the twins, was a thoughtful and considerate ruler in contrast to his father, Kawelo-mahamaha-iʻa and his son, Kawelo-ʻai-kanaka, but he didnʻt live long as a ruling chief. Kawelo-ʻai-kanaka or Aikanaka was afforded awesome power because of his *niʻaupiʻo* rank, but his cousin Kawelo-lei-makua (Kawelo) was not impressed. The rivalry between the cousins continued until Kawelo and his younger brother Ka-malama decided to leave Kauaʻi and join relatives on Oʻahu. They settled on land given them at Halemanu where they often crossed the pass [Kolekole] into Waianae to enjoy the ocean. While on Oʻahu Kawelo trained in many arts. One day Kawelo had a vision of his parents under duress. The following day two men from Kauaʻi brought him a message saying that his cousin ʻAi-kanaka had stripped his parents of everything and thrown them from the top of the mountain where they had sought refuge (Wichman 2003: 73-78).

**Kawelo and Kāne-wahine-iki-aoha** Kawelo borrowed a war canoe and twenty-four warriors from Oʻahu ruling chief Ka-ihi-kapu who waived payment and sailed to Kauaʻi with his wife Kāne-wahine-iki-aoha, his brother, his two foster sons, his uncles who had delivered the message, twelve Ulu warriors and his war god Kāne-ika-pua-lena. A great battle ensued and all the champions of ʻAi-kanaka were killed and he fled. Kawelo had avenged his parents and now Kauaʻi belonged him. He divided the island between his wife, brother, and his foster sons. His brother Ka-malama presided over the Kona district and Kawelo the Puna district with the help of one foster son, Ka-ele-hā-o-Puna. Peace came to Kauaʻi again (Wichman 2003: 78-84).

**ʻAi-kanaka and Kawelo** One day Ka-ele-hā-o-Puna decided to visit Mānā. He arrived at Wahiawa in the evening and was invited to spend the night. His host had another guest, none other than ʻAikanaka who had gone into hiding at Kōʻūla valley. ʻAi-kanaka immediately recognized Ka-ele-hā-o-Puna and invited him to spend the night in the company of his daughter Kawelo-ʻēha. Ka-ele-hā-o-Puna fell in love with Kawelo-ʻēha and the two were quickly married. Ka-ele-hā-o-Puna had little to give ʻAi-kanaka for his kindness and eventually gave him information that Kawelo did not learn to defend himself against an attack by stones. Huge cairns of stones were piled on the plains of Wahiawa. Kawelo heard

rumors and asked his brother Ka-malama to investigate. His brother did, an altercation broke out and Ka-malama was killed by Ka-ele-hā-o-Puna stabbing him in his back. Upon hearing this news of his brotherʻs death, Kawelo sent for his other foster son and his wife, but left before they arrived. He met up with Ka-ele-hā-o-Puna and ʻAi-kanaka who stoned him. He recovered three times, but the fourth time he laid stunned, assumed dead. His body was wrapped in banana stalks and taken to Maulili *heiau* in Kōloa to be sacrificed the next morning. The guardians of the *heiau* were Kaweloʻs sister and her husband. During the night they revived him and when ʻAikanaka came to the *heiau* he was killed by Kawelo. However, he spared his foster son Ka-ele-hā-o-Puna. His wife and other foster son arrived with their forces and killed the fleeing warriors of ʻAikanaka. They gathered the body of Ka-malama and demanded the death of Ka-ele-hā-o-Puna. Kawelo still refused until he was shown that his brother had been stabbed in the back. He killed Ka-ele-hā-o-Puna with one blow. The legends are not clear at what happened to Kawelo; one possibility was that he had been thrown off the cliff at Hanapepe by his men who feared his obsession to go after all of ʻAi-kanakaʻs relatives. However, not much time had passed between the death of ʻAi-kanaka and the arrival of Kūaliʻi as *aliʻi nui* of Kauaʻi, breaking the direct line of twelve generations of ruling chiefs from father to son beginning with Ahukini-a-Laʻa (Wichman 2003: 84-86).

### 3.3.3.9 End of Kauaʻi Direct Line Rule

**Kū-aliʻi and Pele-io-holani** In order to get warriors and a canoe, Kawelo had agreed to cede Kauaʻi to Kū-aliʻi in case both he and ʻAi-kanaka should die in the impending war. Kū-aliʻi had a good claim on Kauaʻi as any other *aliʻi* as his grandmother was Kawelo-lau-huki, daughter of Kawelo-mahamaha-iʻa. He had inherited the *kumukānāwai* of his great-grandmother Ka-hā-malu-ʻuhi who had been wife to both Kā-kuhi-hewa and his son Kāne-kapu-a-Kā-kuhi-hewa. As a young man Kū-aliʻi went to Kauaʻi to gather *kaula* wood for weapons and a war club and Kawelo-lei-makua (Kawelo) had been his guide. When Kū-aliʻi, who was now ruling chief of Oʻahu, heard that ʻAi-kanaka had been killed by Kawelo and he himself killed, Kū-aliʻi rushed to Kauaʻi to declare himself the *aliʻi nui*. He installed his son Pele-io-holani as governor. Under Kū-aliʻi Kauaʻi supplied men and arms to the wars that spread over the windward islands as Kū-aliʻi and his son Pele-io-holani established a multi-island kingdom with Kū-aliʻi *aliʻi nui* of Molokaʻi, Lānaʻi, and Maui. Kū-aliʻi lived to a very old age [some say 175] and at his death his oldest son, Ka-piʻo-hoʻokā-lani became ruling chief of Oʻahu and Pele-io-holani of Kauaʻi (Wichman 2003: 89-90).

**Pele-io-holani, Ka-naha-o-kalani and Ka-apuwai** Ka-piʻo-hoʻokā-lani immediately invaded Molokaʻi. Alapaʻi-nui heard this and went to Molokaʻi to avenge his relatives there and killed Ka-piʻo-hoʻokā-lani whose army fled back to Oʻahu where his son Ka-naha-o-ka-lani was now ruling chief. He sent a message to Kauaʻi to ask his uncle Pele-io-holani for help. Pele-io-holani left his daughter Ka-apuwai in charge while he was gone. The impending war on Oʻahu was averted as the cousins Alapaʻi-nui and Pele-io-holani decided to settle peace fully. Pele-io-holani remained on Oʻahu as ruling chief and his daughter remained as governor of Kauaʻi. Ka-apuwai was married to Kaʻume-he-iwā -- they were both descendants of Ka-lani-kukuma, giving their daughter Ka-maka-helei stronger *mana* than her parents. Ka-apuwai died before Pele-io-holani and the government went to her daughter Ka-maka-helei (Wichman 2003: 91-92).

### 3.3.3.10 Oʻahu-Kauaʻi-Maui Aliʻi Nui

**Ka-maka-helei, Kiha, Ka-neoneo and Ka-ʻeo-kū-lani** Ka-maka-helei ruled Kauaʻi with allegiance to her grandfather Pele-io-holani. She married a Kauaʻi chief Kiha and they had three children: two daughters, Lele-māhoa-lani and Ka-lua-i-pihana and a son Keawe. Pele-io-holani sent his grandson Ka-neoneo to Kauaʻi to check on things and Ka-maka-helei put aside Kiha for Ka-neoneo; they had a daughter Ka-puaʻa-moku. Kiha fled to Niʻihau and gathered a small army and raided Kauaʻi. He was

subsequently killed. Pele -io-holani sent for his grandson to help him with problems with Kahekili [II], leaving Ka -maka-helei vulnerable against her uncle K ūmuhana. Seizing this opportunity Kahekili sent his brother Ka'eo -kū-lani to Kaua'i to neutralize the kingdom and woo Ka -maka-helei, who named her son Keawe her heir. It was during this period that Captain Cook landed at Waimea in 1778. Ka -maka-helei presented Cook with gifts of hogs, chickens, bananas, taro, sweet potatoes, sugarcane, yams, fine mats, and tapa cloth. In return Cook presented her with cloth, iron, a sword, knives, bead necklaces and mirrors. Then Ka-maka-helei offered Cook her daughter Lele-māhoa-lani (Wichman 2003: 92-96).

**Ka-maka-helei, Ka-'eo-kū-lani and Ka-umu-ali'i** Ka-maka-helei gave birth to a son, Ka -umu-ali'i in 1780 and shortly after, Kahekili sent for his brother Ka'eo -kū-lani to help with problems on Maui. His son Ka-umu-ali'i was declared heir to Kaua'i with Inamo'o as regent. Kahekili died on O'ahu in 1793 and Maui, Moloka'i and Lana'i came under the rule of Ka'eo -kū-lani, who ruled for a year before becoming homesick for Kaua'i. On his way back he stopped on O'ahu. His nephew, Kalani -kū-pule, thought he was invading O'ahu and a battle ensued. The battle was called off and Ka'eo -kū-lani continued on his journey to Kaua'i. While in Wai'anae he discovered that his counselors were plotting to throw him overboard in mid-channel and return to O'ahu to conquer the island. Ka'eo -kū-lani decided to go into battle with them against Kalani -kū-pule rather than die alone at sea. Ka'eo -kū-lani was killed in 'Aiea in 1794 by rounds of gunfire from two foreign ships hired by Kalani -kū-pule; only the two treasonous counselors escaped back to Kaua'i. The following year Kamehameha I invaded O'ahu and Kalani-kū-pule ended up as a sacrifice to Kamehameha's war god (Wichman 2003: 96-98).

**Ka-umu-ali'i and Keawe** Ka-maka-helei's oldest son Keawe attacked Wailua and captured his younger half-brother Ka-umu-ali'i, who was made a privileged prisoner free to wander Wailua, but couldn't leave without Keawe. Keawe then declared himself *ali'i nui* of Kaua'i. Joining Keawe was Ki'i-kīkī, one of the treasonous counselors and *konohiki* of Wainiha. Ki'i-kīkī's brother Kāne-'ehu was *konohiki* of Hanapēpē. Keawe did well for a year. He collected all the muskets, guns and ammunition on the island as a symbol of power and put his trust in the brothers Ki'i -kīkī and Kāne-'ehu, as no one had returned from O'ahu to warn him of their treachery. They convinced him to take a tour around the island and meet his subjects. In Kapa'a Keawe went to bathe in the famous pool *Kupa-nihi*. While there Ki'i -kīkī got a rifle and shot Keawe. Kāne-'ehu advised his brother to return to Wailua and kill Ka -umu-ali'i, but Ki'i -kīkī refused saying he could control the young chief. Ki'i -kīkī took all the guns and went to Polihale, while Kāne-'ehu went back to Hanapēpē (Wichman 2003: 99).

**Ka-umu-ali'i, Nā-kaikua'ana and Kamehameha** Although now free from his brother Keawe and his regent Inamo'o, Ka -umu-ali'i knew that Ki'i -kīkī and Kāne-'ehu were very dangerous, so he turned to Nā-kaikua'ana, a member of his court and a close friend of Ki'i -kīkī. Ka-umu-ali'i bribed Nā-kaikua'ana with his wives. After some time Nā-kaikua'ana realized that he could also be in danger of losing his life so he swore allegiance to Ka -umu-ali'i. To prove his loyalty he offered a plan to regain the guns. When Ki'i-kīkī was out surfing one day at Ka -ua, Makaweli, Nā-kaikua'ana seized the guns. Ki'i -kīkī hurried to Hanapēpē to his brother; both of them fled to 'Ewa, O'ahu, but Nā-kaikua'ana followed them and killed the brothers. However, Nā-kaikua'ana returned to Kaua'i with disturbing news; Kamehameha, no ruler of the windward islands was preparing to invade Kaua'i. After two failed attempts, Kamehameha sent a message to the young chief to recognize him as sovereign. Ka -umu-ali'i realized that it was a matter of time and he didn't have the resources to beat Kamehameha, so he accepted. However, he refused the many invitations to go to O'ahu and make a public oath fearing the same fate as Ke ōua. After many more invitations an order came that he could not refuse. Ka -umu-ali'i left Kaua'i to meet Kamehameha on O'ahu. Kamehameha turned down the offer of the lands of Kaua'i and invited him to land where he was royally entertained. A few days later, members of Kamehameha's court invited Ka-umu-ali'i to a feast. On the way there he stopped to visit Isaac Davis who warned him that they were plotting to kill him there. Ka -umu-ali'i changed his plans. Before leaving he stopped by to see

Kamehameha and Ka-lani-moku who told Ka-umu-ali'i to "take care of the chief Liholiho who belongs to you and to your cousin Ka-'ahu-manu. Liholiho shall be the heir" (Wichman 2003: 99-104).

**Ka-umu-ali'i, Liholiho and Ka -'ahu-manu** Ka-umu-ali'i could only agree - he went to O'ahu as a ruler and returned to Kaua'i as a vassal, but he saved his kingdom from a bloodbath. Shortly after returning to Kaua'i he received word that Isaac Davis had himself been poisoned. The young chief's world was continuously changing as more and more ships came - whalers, merchants, including sandalwood merchants, and traders. The traders built a trading post at Waimea and a fort shortly after. With his new-found income, Ka-umu-ali'i purchased guns, ammunition and ships with hopes of someday getting out of the stranglehold of Kamehameha. This was never to be; in 1819 Kamehameha died and his son Liholiho and Queen Ka'ahumanu as his regent, took over.

They radically and forever changed the social structure of the Hawaiian society by extinguishing the *kapu* system. The following year Calvin Congregational missionaries arrived in Hawai'i to a society with a structural/religious void, as well as Humehume, oldest son of Ka -umu-ali'i who had been given up as lost. He had been placed in the care of a Yankee captain when he was seven, to be educated. The captain died and Humehume was turned out into the streets. He was later sent to the Congregational school in Cornwall, Connecticut where several other Hawaiian youth were. When the first missionaries left, they took Humehume (George) with them. Humehume and the missionaries were welcomed by Ka -umu-ali'i who gave the missionaries land to build a church and school; Ka-umu-ali'i was later converted.

In 1821 after spending over a month enjoying Kaua'i hospitality, Liholiho invited Ka-umu-ali'i to his brig for dinner. He quietly gave the order to set sail with Ka-umu-ali'i as his prisoner. Later that year he was "compelled" to marry his cousin Ka'ahumanu; she also married his son and heir. From then on the Kaua'i chiefs were kept at her side. In 1824, as Ka -umu-ali'i lay dying, his family were allowed to come to O'ahu, but they were not allowed to see him before he died. He was taken in state to Maui where he was buried next to Ke ōpū-o-lani [also his cousin], sacred queen of Kamehameha. (Wichman 2003:104-110); he was the last king of Kaua'i.

### 3.3.4 'Ōlelo No'eau

'*Ōlelo no'eau* or proverbial/traditional sayings usually had several layers of meanings. They reflected the wisdom, observations, poetry and humor of old Hawai'i. Some of them referenced people, events or places. The following '*ōlelo no'eau* were compiled by Pukui between 1910 and 1960 with both translations and an explanation of their meaning (Williamson, et al. in Pukui, 1983:vii), which are often more *kaona* (hidden or double meaning) than obvious; they refer to places or *ali'i nui* associated with places and people of Hā'ena and other places in the vicinity.

|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ' <i>Ōlelo no'eau</i> : | <i>Kīlīoe wahine i uka.</i>                                                                                                                                                                                                             |
| Translation:            | Kīlīoe, woman of the upland.                                                                                                                                                                                                            |
| Meaning:                | Kīlīoe was a <i>wahine mo'o</i> (lizard woman) famed in chants and songs of the <i>ali'i</i> . She belonged to Kaua'i and it was she who tried to prevent Hi'iaka from taking the body of Lohi'au from a cave at Hā'ena (#1799, p 193). |
| ' <i>Ōlelo no'eau</i> : | <i>'Ō'ili pulelo ke ahi o Kāmaile.</i>                                                                                                                                                                                                  |
| Translation:            | The fire of Kāmaile rises in triumph.                                                                                                                                                                                                   |
| Meaning:                | Said of one who is victorious over obstacles, this is the first line of a chant composed for Kamehameha II. In olden days, firebrands hurled from the cliffs at Hā'ena, Kaua'i, made a spectacular sight (#2392, p 261).                |

|                                                     |                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Meaning:                                            | Kaua‘i, the northwestern most island of the group, beyond which the sun vanishes at dusk. Manokalanipo was an ancient ruler of Kaua‘i (#1488, p 161).                                                                                                                                                 |
| ‘ <i>Ōlelo no‘eau</i> :<br>Translation:<br>Meaning: | <i>‘Akāhi a komo ke anu ia ‘u, ua nahā ka hale e malu ai.</i><br>Cold now penetrates me, for the house that shelters is broken.<br>Fear enters when protection is gone. Said by ‘Aikanaka of Kaua‘i when two of his war leaders were destroyed by Kawelo (#90, p 12).                                 |
| ‘ <i>Ōlelo no‘eau</i> :<br>Translation:<br>Meaning: | <i>Ka ipo laua‘e o Makana.</i><br>The beloved laua‘e of Makana. (Refers to the famed variety of fern used in lei for its fragrance and grew near Pu‘u Makana)<br>Refers to a loved one (Pukui and Elbert 1986:194).                                                                                   |
| ‘ <i>Ōlelo no‘eau</i> :<br>Translation:<br>Meaning: | <i>Ka pali kā‘ili wahine o Kē‘ē.</i><br>The wife-snatching cliff of Kē‘ē.<br>Alludes to a tale in which the men of Kē‘ē fell in love with the women ( <i>wahine</i> ) of Nu‘alolo, went to that valley and scaled the cliff to reach it, threatened the men and took the women back (Pukui 1983:165). |
| ‘ <i>Ōlelo no‘eau</i> :<br>Translation:<br>Meaning: | <i>Kupopou ana i ka pali o Kē‘ē.</i><br>Going downhill at the cliff of Kē‘ē.<br>Said of a non-cooperative person and played on the place name's resemblance to <i>kē</i> (to object) and <i>‘ē</i> (elsewhere) (Pukui 1983:207).                                                                      |
| ‘ <i>Ōlelo no‘eau</i> :<br>Translation:<br>Meaning: | <i>Aia a Kē‘ē.</i><br>There at Kē‘ē.<br>Refers to the distance between Kē‘ē and other locales; figuratively it means something hardly worth looking for, it is so far away (Pukui 1976:105).                                                                                                          |

### 3.3.5 Place and Object Names

Hawaiians of old generally named everything; from winds and mountains, to rocks, canoes, taro patches, fishing stations, and “the tiniest spots where miraculous or interesting events are believed to have taken place” (Elbert in Pukui et al., 1974: x). They all represented a story, some known only locally, while others became legendary. The list below (Table 2) represents place names with an association to project lands in Hā‘ena and vicinity.

**Table 2.** Place and object names in Hā‘ena and their *mo‘olelo* and significance

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Hā‘ena</b>      | Tucked against the Nāpali cliffs is the ahupua‘a of Hā‘ena; “red hot” – possible reference to strong <i>kapu</i> that surrounded this place (Wichman 1998:125). Land section, village, point. <i>A Lohi‘au-ipo i Hā‘ena lā, ‘ena‘ena ke aloha ke hiki mai</i> ; and <i>Lohi‘au-ipo</i> at Red-hot, hot the love that comes (Pukui et al. 1974:34). Hā‘ena was always ruled by a chiefess who was independent of the <i>ali‘i nui</i> and who ruled for life. One high chiefess was Kekela who was alive during the Mahele and directed the people to file their land claims. Hā‘ena was also noted for the quality of dog grown here as food for the chiefesses who were not permitted to eat pork (Wichman 1998:126). |
| <b>Hala-aniani</b> | “Clear-pandanus” – the lake of fresh water within the upper wet cave of Hā‘ena; it was set aside for the <i>ali‘i</i> and commoners could not bathe in it. The waters were thought to be able to restore an ailing person back to health. The chiefs either drank from a calabash filled with the water or swam in the underground lake (Wichman 1998:129). Visitors in                                                                                                                                                                                                                                                                                                                                                |

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                            | 1849 reported legends of <i>mo`owahine</i> and a white substance on the surface there, although it did not keep them from taking a canoe inside to explore (Alexander 1991:126-127).                                                                                                                                                                                                                                                                               |
| <b>Halele`a</b>            | “House of happiness” – cited in chants as the most beautiful place in all the islands. Moku or district on Kaua`i that includes Kalihiwai, Kalihikai, Hanalei, Wai`oli, Waipā, Waikoko, Lumaha`i, Wainiha and Hā`ena; the extent includes Wai`ale`ale to the sea, bordered by Nāpali on the west and Puna (the Makaleha Mtns) and Ko`olau on the east (Wichman 1998:105).                                                                                          |
| <b>ʻĪlio Point</b>         | “Dog” Point – may refer to the Polynesian-introduced canine or the seal ( <i>ʻĪhoholoikauaua</i> ) - “dog running in the rough seas” who have been known to beach themselves there (Major and Carpenter 2001:9).                                                                                                                                                                                                                                                   |
| <b>Ka`aulama-poko</b>      | A fishing hole near shore “light from a short-burning torch” because it can be fished at night using a <i>kukui</i> nut torch, which never burned for very long (Wichman 1998:125).                                                                                                                                                                                                                                                                                |
| <b>Kai-kua`au-o-Hā`ena</b> | “Lagoon sea of Hā`ena” – the only lagoon on Kaua`i – protects Makua Bay (Wichman 1998:125).                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Ka-lua-`āweoweo</b>     | “ <i>Āweoweo</i> hole” is the fishing hole at the farthest point from land; the <i>ʻāweoweo</i> gather in this grotto – this fish was eaten raw, cooked or dried. A large school of young <i>ʻāweoweo</i> ( <i>alalauā</i> ) swimming into the bay was an omen of the death of a high chief (Wichman 1998:125).                                                                                                                                                    |
| <b>Ka`iwi-ku`i</b>         | A Hawaiian man and his wife used to steal from the fields of the Menehune farmers in Mānoa Valley; he was chased up the ridge toward Pōhaku-o-Kāne where he put up a fight, but the Menehune used their slingshots and pelted him with stones. Some were so large that the bones of his skull were shattered...in this form he was turned to stone – the ridge where he lies was named Ka`iwi -ku`i or “hammered bone” (Wichman 1998:126-127).                     |
| <b>Kānehunamoku</b>        | “Kāne’s hidden island” son of two cloud gods Manoiku(kiu)lani (“Male head of the clouds in the blue sky”) and Hihikalani (“Female head of the rolling clouds”) who lives on a floating island that is “sacred and shall not be seen in the light of day. It shall be seen only at certain kapu periods in July and August When it hovers near Hā`ena, Kaua`i, then he shall be near on the floating island of Kaonohiula” (Beckwith 1970:71).                      |
| <b>Kaonohiula</b>          | Floating Island that hovers near Hā`ena, Kaua`i in <i>kapu</i> periods of July and August (Beckwith 1970:71). Beckwith interprets references to invisible or floating islands and clouds as metaphors for the seclusion of high-ranking <i>ali`i</i> children raised under strict <i>kapu</i> and thus it may be inferred that Hā`ena was considered a sacred place...where <i>ali`i</i> children were raised and trained (Major and Carpenter 2001:6).            |
| <b>Ke-ahu-a-Laka</b>       | “Inspiration of Laka” – Hā`ena was famous for its schools where students came to study the sacred forms of <i>hula</i> or to learn the history and genealogies of the chiefs. Ke-ahu-o-Laka [ <i>heiau</i> ] was the school of <i>hula</i> , chanting and composing religious chants as well as songs. The student remained for seven years. The <i>heiau</i> and the student were dedicated to Laka, goddess of the forest and dance (Wichman 1998:132).          |
| <b>Ka-ulu-o-Pā`oa</b>      | “Inspiration of Pā`oa” – This <i>heiau</i> was the school for historians and genealogists. It was said that during the final examination a student listened to a genealogical list that lasted several hours and had to repeat it without error. Pā`oa was the <i>kahuna nui</i> and close friend of Lohi`au at the time of Pele’s arrival. He swore to avenge Lohi`au’s death and confronted Pele at her home on Hawai`i. Pele, assuming her most beautiful form, |

beguiled Pā`oa into living with her for three days. He drowned himself in shame for not having kept his oath (Wichman 1998:132).

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Ke-a`a-lewalewa</b> | “Dangling root” is a peak on the east side of Mānoa Valley; <i>a`a lewalewa</i> are aerial roots of the <i>ʻōhi`a lehua</i> tree of the forests or the pandanus tree of the lowlands. Kea`alewalewa was a Wainiha man who constantly stole food from the Menehune farmers of Mānoa Valley. They got so angry after a time that they chased after him and turned him into stone (Wichman 1998:126).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Ke`ē</b>            | “Avoidance” – beach and cliff west of Hā`ena, Kaua`i (Pukui 1974:105). The beach and lagoon at the beginning of Nāpali District is Ke`ē, the site of the legend of Pele, Lohi`au and Hi`iaka. Pele came to Ke`ē when she was first looking for a home and safety from her sister Nāmakaokīaha`i. Once she found her home on Hawai`i Island she was lured back by Lohi`au’s drumming. She returned and found him and fell in love with him, but each time she dug a cave to make a home for them, she met with water. She left Kaua`i as she was in her spiritual body, promising Lohi`au she would return for him. After a long wait, Lohi`au hung himself in despair. His body was placed in a cave above Ke`ē and was guarded by two <i>mo`o</i> sisters Kilioe and Aka. When Hi`iaka and Wahine-ōma`o arrived as envoys from Pele they found Lohi`au dead. Hi`iaka killed the two guardians and with herbs and prayers restored Lohi`au’s life then took him to Pele, who in the meantime had destroyed Hi`iaka’s <i>Lehua</i> forest. The angry Hi`iaka embraced Lohi`au so Pele covered him with lava. Hi`iaka dug a tunnel from the sea to her sister’s fire pit and almost succeeded in killing Pele, but their brothers persuaded her not to. Hi`iaka returned to Kaua`i; her brothers restored Lohi`au’s life once more and sent him after Hi`iaka. They married and spent the rest of their life together at Ke`ē (Wichman 1998:130). Ke`ē probably also refers to the <i>kapu</i> of the place in light of Beckwith’s interpretation of legends as reference to seclusion of <i>ali`i</i> (Major and Carpenter 2001:9). `Īli of Hā`ena (Waihona 2010) |
| <b>Kilioe</b>          | The body of Kilioe became a furrowed rock beside the sea that is still used as a birth rock, a place for safeguarding the umbilical cord of newborns. In doing so, the child is placed under the protection of Kilioe. The ancients believed that the fate of the umbilical cord foretold the child’s life (Wichman 1998:130). When Hi`iaka went to find Lohi`au for Pele, she had to fight two supernatural lizard women (Kilioe and Aka according to Wichman 1998; Kilioa and Kalaimanu according to Kalākaua 1990; Kilioekapua and Kalanamainu`u according to Beckwith 1970). Kilioe was turned into a <i>pōhaku</i> that was used as a <i>piko</i> stone where the umbilical cord of a newborn infant was placed to be under the protection of the <i>mo`owahine</i> (Wichman 1998:130).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Koa-manō</b>        | On the way to Kaua`i, Makani-kau, chief of the winds, god of love, was crossing the channel between O`ahu and Kaua`i in his wind form and saw some people being chased by a big shark. He landed on the canoe and told the frightened people he would play with the shark and they needn’t worry. He jumped into the sea and the shark opened its mouth to seize him but he climbed onto it and caught its fins and forced it to flee through the water into the rocks and became the great shark stone Koa-manō “shark warrior.” Kahuna Pa`ihulu would go to this rock and offer prayers and food to a shark. The shark would then carry him to Kalalau and back again (Wichman 1998:125-126).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Limahuli</b>        | “Turning hand” – a deep valley in Hā`ena (Wichman 1998:125; Pukui et al. 1974:133).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Makana</b>          | “Gift” – a triangular peak, prominent and unmistakable. Firebrands ( <i>ʻōahi</i> ) were thrown from the top of this peak. On the side of Makana is a storied stone, a reminder of a tale of friendship. Nou was a boy who saved the life of a Menehune who had fallen; in return the Menehune promised Nou that he would become a champion firebrand thrower. The other firebrand throwers became jealous of Nou and his prizes and killed him. The Menehune put Nou’s body into a cave and sat at the entrance and allowed himself to turn into stone                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

to guard the bones of his friend (Wichman 1998:129). ‘*Ō`ahi* were thrown from Makana up into early historic times: during Queen Emma’s 1860 visit to Kaua’i; when Eric Knudsen staged a display in the early 1900s; and on Kamehameha Day in 1925(Knudsen 1946; Barrere and Kelly 1978In Major and Carpenter 2001:8).

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Makua</b>       | “Ancestor” – a large lagoon and bay in the <i>ahupua`a</i> of Hā`ena (Wichman 1998:125).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Manini-holo</b> | “Traveling reef surgeon fish” – large dry cave on Ka`iwiku`i Ridge; Manini -holo was also the name of the head fisherman at the time the Menehune were leaving the island to return to their homelands. He brought his workers to gather food from the reef and bay of Hā`ena; during the night all the food disappeared, but Manini-holo saw the <i>e`epa</i> in the fissures of the pali and realized they were the thieves so they killed them. The Menehune gathered in the mountains, crossed Nāpali coming to the plain in front of Manini-holo where they boarded their canoes in Makua Bay. They sailed away and never returned (Wichman 1998:127-128). Historic visitors were told that a certain side room of the cave was used as a hiding place by <i>ali`i</i> during times of war (Alexander 1991:126) and construed that a stone wall at the rear of the cave was meant to block off a burial area (Lydgate 1991:139) ( <u>In</u> Major and Carpenter 2001:9).                                                                                |
| <b>Mānoa</b>       | “Thick” – a shallow valley in Hā`ena (Wichman 1998:125). Stream (Pukui et al. 1974:146). ‘Ili of Hā`ena (Waihona 2010)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Naenae</b>      | “Congested” – wife of Hawaiian man who stole from Menehune farmers; they chased her into Limahuli Valley. She stopped to rest near the waterfall where the Menehune caught her and killed her. She was turned to stone and is called Naenae (Wichman 1998:126).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Nā-hiki</b>     | “Many arrivals” – the bay beside the two <i>heiau</i> . At the end of their training students at the <i>hula</i> school had to swim in the lagoon, go out the channel into the ocean and come ashore at Nāhiki where even on calm days, the waves surge fiercely in and out. In so doing they passed the shark that was fed by the chiefess. Those students who had broken any rules were devoured by it. Those who were without fault came ashore safely (Wichman 1998:132).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Nā-Piliwale</b> | “Clinging ones” or “the emaciated ones” – a stone formation on the Mānoa ridge looks like two running figures with skirts flying up behind them. It was the custom of the four Piliwale sisters to visit a chief’s court and remain until all the food in the area had been consumed. There fore their appearance heralded a forthcoming famine. They had extraordinary appetites; their favorite foods were freshwater shrimp and snails and the fiddlehead fern ( <i>hō`i`o</i> ). Two sisters came to Hā`ena and because they were <i>kupua</i> and could not tolerate the sun, Lohi`au and his sister Kahua nui built them a shelter in Maniniholo Cave and one on the ridge so they could enjoy the view. They were fed their favorite foods at night and entertained by every <i>hula</i> dancer at the school at Ke`e. One night they forgot the time and raced down the ridge to the cave but the sun’s rays caught them and turned them into stone; they remain there as a warning to the other two sisters not to visit Kaua`i (Wichman 1998:127). |
| <b>‘O`o`a`a</b>    | “Fast-rooted one” – a boulder formerly on Hauwā reef that now lies in the depths. ‘ <i>Ō`i`ā`ā</i> came to Kaua`i with her two brothers in the form of rocks; after their long journey she rested on the sea and became a guardian of the reef. She was moved from the reef in the 1946 tsunami where she is still waiting for her brothers offshore. She can be seen by snorkelers (Wichman 1998:128).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Pā-ka-moi</b>   | “Enclosure of the threadfin fish” – a boulder near the base of the upper wet cave (Waiakanaloa); also connected to the story of Pele and Lohi`au. When Hi`iaka and her companion Wahine`ōma`o reached Hā`ena they asked Pakamoi a fisherman to find them a place to sleep for the night. He mistook the tenor of their request and after watching                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

them loosen their clothes in preparation for sleeping, he attempted to fulfill his desires on Hi`iaka who was saved by Pā`ū-o-Pala`e, a friend and servant, who changed places with her. Pakamoi was turned to stone where he lay (Wichman 1998:129).

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Papaloa</b>          | “Long reef” – (Major and Carpenter 2001:9)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Pōhaku-o-Kāne</b>    | “Stone of Kāne” – brother of ‘ <i>Ō`ō`ā`ā</i> who tried to climb to the peak above but because he was round and the cliff was sheer, he would roll back to the bottom where he would start over. The god Kāne took pity on him reached down and placed the rock on the peak. It is said that when Pōhakuokāne decides to leave his perch, Kāne will raise the waters of the ocean to his level (Wichman 1998:128).                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Pōhaku-loa</b>       | “Long-rock” – the other brother of ‘ <i>Ō`ō`ā`ā</i> who rested on the top of the sand dunes (Wichman 1998:128).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Wai-a-Kanaloa</b>    | “Water made by Kanaloa” – Kanaloa was one of the four major Hawaiian gods and brother of Kāne. They were known for digging sources of drinking water as they toured the various islands. The upper wet cave (Wai-a-Kanaloa) in Hā`ena was dug by Kanaloa. Other legends say it was Pele who struck the cliff here with her staff <i>Pā`oa</i> when she was searching for a home, but was met by water instead (Wichman 1998:129).                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Wai-a-ka-Pa-la`e</b> | “Water of the lace fern” – the lower wet cave in Hā`ena. In the olden times, the water in the cave had a brownish hue, which was said to be the hair of a beautiful <i>mo`o</i> maiden who could usually be seen sitting near the entrance of the cave combing her hair. A chief from Wainiha fell in love with her and the two disappeared for several months. Then the mermaid reappeared with a baby at her breast. When asked where the chief was she drew her finger across her neck to indicate that he was dead. In revenge, his friends tried to kill the <i>mo`o</i> but she dove into the water and escaped. Her long hair spread out in the water giving the pool its color. As she grew older the brown tint turned gray. For this reason the cave was known either as Wai-a-kapa-lae - “water of terror” or Wai-a-kapa-la`e – “water of shiny tapa” (Wichman 1998:129-130). |

3.3.6 Winds

3.3.6.1 Winds of Halele`a

Halele`a is cooled by *Kaiālulu*, a pleasant and gentle trade wind; and sometimes the forceful Ko`olau trade wind *Hao-Ko`olau-o-Halele`a*.

3.3.6.2 Winds of Hā`ena (Poepoe 1911 In Pacific Worlds).

*He Kalahale ka makani o Hā`ena*  
*He Limahuli ka manaki o Hā`ena*  
*He Kolokini ka makani he`enalu o Kahuanui a Lohi`auipo, i Hā`ena*  
*He Unukupua ka makani lawe leo a Lohi`au-ipo i Hā`ena*  
*He Kanaenae ka makani kaili aloha a Lohi`au i Hā`ena*  
*He Kilauae ka makani kaili aloha a Lohi`au i Hā`ena*  
*He Leoikua ka makani lawe aloha a Lohi`au-ipo i Hā`ena*  
*He Ipo noenoe lauwa`e ka makani ki`i wahine a Lohi`au ipo i Hā`ena*  
*Aloha wa`e o Lohi`au-ipo i Hā`ena e--!"*

Wichman (In Pacific Worlds) expands on the winds of Hā`ena below:

**Kalahale** refers to a house gable, but was also name of a chiefess of Iā`ena.

### 3.4.0 Historic References

By and large “Historic References” pertain to notable historic events, overviews of important place names and land tenure within the project area and districts. One of the most significant practices in the history of the Hawaiian people was their concept of stewardship of the land. However, over time, these practices were replaced by more western methods of land tenure and use, as the lands of Kāuaʻi went from the domain of the *aliʻi nui* to the domain of the monarchy to various individuals and corporate entities.

#### 3.4.1 History of Land Divisions

It was during the time of Kūkona (ca. 1400s), father of Manōka-lani-pō (ca. 1405 -1455AD) that the division of lands is said to have taken place (Wichman 2003:53 -54). The islands were portioned into districts, sub-districts, and smaller divisions, each ruled over by an agent appointed by the landlord of the next larger division, and the whole under control of the ruling chief over the whole island or whatever part of it was his to govern (Beckwith 1970:383). Each island was divided into *moku* or districts that were controlled by an *aliʻi ʻai moku*. Within each of the *moku* on each island, the land was further divided into *ahupuaʻa* and controlled by land managers or *konohiki*. The boundaries of the *ahupuaʻa* were delineated by natural features such as shoreline, ridges, streams and peaks, usually from the mountain to the sea, and ranged in size from less than ten acres to 180,000 acres (Moffat and Kirkpatrick 1995:24 -29, see also Chinen 1958:3). But sometimes “only the line of growth of a certain tree or grass marked a boundary; and sometimes only a stone determined the corner of a division” (Chinen 1958:1). The ideal *ahupuaʻa*, from mountain to the sea, enabled a chief and his followers to obtain fish and seaweed at the seashore, taro, sweet potatoes and bananas from the lowlands, and forest products from the mountains. However, this more often than not, was not the case (Chinen 1958:3).

Each *ahupuaʻa* was often divided and subdivided several times over (i.e., *ʻili*, *kuleana*, *moʻo*, *pauka*, *koele*, *kiha pai*), answerable to *aliʻi* where the lesser division was located. However the *ili kupono* or the *ili ku* was “completely independent of the *ahupuaʻa* in which it was situated...tributes were paid directly to the king himself” (Chinen 1958:4). Some *ahupuaʻa* did not have any *ʻili*, while others had as many as forty, “each with its own name and carefully defined boundaries” (Chinen 1958: 3). *Moʻo* or *moʻo ʻāina* were the next size of land division; these were set for cultivation purposes only. *Moʻo* were subdivided into *pauka* which were also for cultivation only. Patches of land cultivated by tenants for their chiefs were called *koele* or *poʻalima* because they were worked only on Fridays. A *kihapai* was cultivated only for the tenant and his family. Rights to lands were mutable or revocable; a ruling chief or any “distributor” of lands could change these rights if displeased, or as favors –usually after a victorious battle, and after the death of the *aliʻi nui* (Chinen 1958:5).

During the period between 1839 and 1855, several legislative acts transformed the centuries-old Hawaiian traditions of *aliʻi nui* land stewardship to the western practice of private land ownership. In the first stage King Kamehameha III (Kauikēaouli) divided up his lands among the highest ranking *aliʻi* (chiefs), *konohiki* (land managers), and favored *haole* (foreigners) (Chinen 1958:7 -14; Moffat and Fitzpatrick, 1995:11, 17). This historic land transformation process was an evolution of concepts brought about by fear, growing concerns of takeovers, and western influence regarding land possession. Kamehameha III, in his mid-thirties, was persuaded by his *kuhina nui* and other advisors to take a course that would assure personal rights to land.

In 1846 he appointed a Board of Commissioners ‘To Quiet Land Titles’ - commonly known as the Land Commission, to “confirm or reject all claims to land arising previously to the 10<sup>th</sup> day of December, AD 1845.” Notices were frequently posted in *The Polynesian* (Moffat and Kirkpatrick, 1995). Kamehameha III formalized the division of lands among himself (one-third) and 245 of the highest-ranking *aliʻi* and *konohiki* (one-third) between January 27 to March 7, 1848. He acknowledged the rights of these

individuals to various land divisions in what came to be known as the *Buke Mahele* or ‘sharing book.’ These lands, however, were all “subject to the rights of native tenants” or *kuleana* lands, with reversionary rights to *ahupuaʻa* and *ili kupono* claimants if the tenant died without heirs (Chinen 1958: 29-30). The *Great Mahele* marked the end of the feudal system in the kingdom (Chinen 1958:15).

However, the legislature did not acknowledge this act until June 7, 1848 (Chinen 1958:16; Moffat and Kirkpatrick, 1995:48 -49). “The mahele did not actually convey title to the various *aliʻi* and *konohiki*; it essentially gave them the right to claim the lands assigned to them –these lands became known as the *konohiki* lands. The *konohiki* chiefs were required to present formal claims to the Land Commission and pay a commutation fee, which could be accomplished by surrendering a portion of their land to the government.” The government could later sell these lands to the public. Upon payment of the commutation fee, the Minister of Interior issued a Royal Patent to the chief or *konohiki*.

The last one-third was originally designated to the *maka ʻāinana*, but not acted on –instead it was set aside to the government, “subject always to the rights of the tenants” (Moffat and Kirkpatrick, 1995:41 -43; see also Chinen 1958:15 -21). *ʻIli kupono* were the only *ʻili* (parcel) recognized in this process, all the *ʻili* and lesser divisions were absorbed into the *ahupuaʻa* claim (Chinen 1958:20).

In 1892 the legislature authorized the Minister of Interior to issue Royal Patents to all *konohiki* or to their heirs or assignees where the *konohiki* had failed to receive awards for their lands from the Land Commission. The Act further stipulated “that these Royal Patents were to be issued on surveys approved by the Surveyor General of the kingdom” (Chinen 1958:24; Moffat and Fitzpatrick 1995:41 -43).

#### 3.4.2 Hāʻena Ahupuaʻa

The *ahupuaʻa* of Hāʻena is located in the *moku* of Haleleʻa. Its valleys are not very deep and the *ahupuaʻa* is relatively small (1500 acres) compared to adjacent *ahupuaʻa* of Hanakāpāʻai on the west and Wainiha on the east. However, Hāʻena does include extensive, well-watered agricultural areas along two main stream valleys of Mānoa and Limahuli, as well as flat land along the coast making it suitable for both agriculture and habitation. The broad sand beach with its protecting reef would have provided a useful canoe landing and nearshore marine resources. Hāʻena is the westernmost *ahupuaʻa* in the district of Haleleʻa with easy access to the bountiful deep-sea fishing grounds of neighboring Nā Pali district (Major and Carpenter 2001:13).

Griffin (1984:6-7) concluded that the occupation of Hāʻena was divided into four phases, each with particular characteristics of cultural adaptation that focused on economy or sources of energy, residence or loci of domicile and task performance. His four phases are (1) Early Occupation, (2) Mid-millennium Stability, (3) Historic Transition and (4) Twentieth Century Adjustment.

The Early Occupation Phase is poorly known. Along the front of Keʻe beach two profiles have revealed deep strata as yet undated, yet suggestive of transient beach use. The data suggest a generalized strand looping adaptation, probably by parties of collectors -fisher people camped a few days at a time. No evidence of agriculture was found, nor is there any reason to argue its necessity. The origins of these hypothetical transients is unknown. Only by archaeological explorations in locations and environments favoring early and simple subsistence systems may we learn of centers of sedentism and population concentration.

The Mid-millennium Occupation Phase is well documented as to presence, duration, concentration, and general adaptation. This phase extends from the 1000s into the 1700s, and marks a shift of increased dependence on taro production and less on collection of marine fauna. The latter never was abandoned, yet as the human population rose, providence of marine resources seems to have diminished somewhat. We suggest that by the time of European arrival, most of the taro

pondfields were completed, the *heiau* built, and the importance of Hā'ena as a social, political, and economic center established.

The Historic Transition Phase, lasting from about A.D. 1800 to 1900, is exciting in what we do know, given excavation results and archival data, yet remains poorly developed. The land award testimonies are suggestive, but no excavations have sought the claimants' houses and fields, nor have the materials likely still hidden in written records and photographs yet been perused. Major anthropological questions remain: were Ha'ena and its people marginal to the colonial activities going on throughout the kingdom, or did Ha'ena play a role as a reservoir of economic and population strength linking Na Pali to Hanalei, Wailua, and other foci of political activity? When and how did Ha'ena lose population? How did the Hawaiian people of the area adapt to changing conditions and cultural systems?

The Twentieth Century Phase cannot be said to be without interest. To an anthropologist the variety of adaptive changes and new people utilizing Ha'ena make the phase one of the most interesting. Hā'ena between 1900 and 1950 saw the end of a land-and-sea focused adaptation, and the withdrawal of the last of the Hawaiian people. Only transient campers, again collectors and fishermen, used the beaches. The Taylor Camp "hippy" occupation was brief and, so far, a bit variant, but is heuristically useful in understanding the range of variations in adaptation to northern Kauai and the nature of American "counter culture" efforts to build alternative life styles. In fact, as we move into the late twentieth century, we are seeing new, diversified uses of Ha'ena. A new form of permanent residence is appearing, in the guise of expensive beach homes of our culture's socio-economic elite. At the same time continued transient occupation by both mobile (vacationing) elite and "squatting" lower class members of society is present. Most distant on the horizon, but still there, are the Hawaiian people, looking toward regaining the land once theirs, for farming, fishing, and residence.

The *mo'olelo* depict Hā'ena as a special place for a very significant chiefly class who interacted with deities such as Pele and her sister Hi'iaka. It was a sacred place where in traditional times Lohiau, lover of Pele and Hi'iaka, was once a chief of Hā'ena. He had a brother Limaloa and a sister Kahuanui who was the actual *ali'i nui* of Hā'ena, which was always ruled by female chiefs who ruled for life. The chiefess was also not under the control or whim of the paramount chief or *mō'i* of Kaua'i, but rather independent (Wichman 1998:126). Lohiau and his sisters paid tribute to Laka and perpetuated the hula in a *halau* (school) whose significance is still honored to this day by *kumu hula* (teachers) and their *haumana* (students). Hā'ena as a chiefly residence continued into the nineteenth century with the Mahele Award [LCA 10613] of Hā'ena lands awarded to *ali'i* Abner Kuho'oheihēpahu Pākī, husband of L. Konia, granddaughter of Kamehameha I and father of Princess Bernice Pauahi Bishop.

| <i>Ahupua'a</i> | <i>Number of Claims</i> | <i>Number of Awards</i> | <i>Ali'i Claimant</i> |
|-----------------|-------------------------|-------------------------|-----------------------|
| Hā'ena          | 34                      | 25                      | A. Pākī               |

Accompanying these chiefs and chiefesses were retainers and favored tenants who provided for the immediate needs of the chief's household.... Hā'ena has limited *kula* lands (flat, open fields/pastures) being that the cliffs drop so sheerly to the shore. Premium *kula* lands would be dedicated to those uses which sustain life—*auwai*, taro cultivation and residence (Silva 1995:18).

As an *ahupua'a* chief Pākī was entitled to select a *kapu* fish and produce of the land (generally taro); Pākī claimed that the *he'e* was the *kapu* fish of Hā'ena and had at least 12 *koele* that were cultivated for him (Silva 1995:25). Abner Pākī informs that *he'e* (octopus) is the *kapu* (restricted) fish [sic] of Hā'ena (Kingdom Konohiki Records 1852; 1854; 1857 In Maly 2003:19).

3.4.3 Konohiki of Hā'ena

*Ahupua'a ali'i* were allowed to have a *konohiki* or land manager and about 1837, Esetera Kekela was appointed as Hā'ena *konohiki* making her one of very few women who held this position; she too later claimed Mahele lands [5 parcels] in Hā'ena LCA #5477 [Ili of Kalole]. Kekela was the last known *konohiki* of Hā'ena.

3.4.3.1 Mo'olelo of Kekela, Konohiki of Hā'ena

Kekela'akalaniwahikapa'a (Kekela) had married Kamehameha I half-brother Kalaimamahu in 1804; five years later in 1809 she is widowed and in 1810 she is given [by Kamehameha I] to Kamaholelani [nephew of Kaumuali'i, king of Kaua'i] and returns with him to Kaua'i to live. Kamaholelani and Kekela settle at Lumahai, an *ahupua'a* not far from Hā'ena, which Kaumuali'i had given to both of them (Kamakau 1992:195; In Silva 1995:28-29).

Kamaholelani is sometimes referred as Kaumuali'i's cousin and his son. It was said that like Kaumuali'i and very few other chiefs of this time (early 1800s), Kamaholelani was adept at speaking and reading the English language (Kamakau 1992:244-245). He apparently was a court favorite and was well-respected among his peers. In 1820 Kamaholelani dies. Kekela remains at Lumahai until 1824. In that year, Kaumuali'i passes away, civil strife results and control of the Kaua'i dominions is given to O'ahu and Maui chiefs. Kekela returns to O'ahu and either forfeits Lumahai or is disposed of it. Further, not only is Kekela well-spoken for in the courts of Kamehameha and Ka'umuali'i, she is also the sister of Abner Pākī's own mother. Hence, her close association to her Hā'ena claim, Pākī's claim to the entire *ahupua'a* and her management of Pākī's Hā'ena holdings (Silva 1995:29).

Land records reveal that Kekela had arrived there [Hā'ena] in 1839 and had probably become settled with her entourage and tenants by 1847 [see missionary census below]. Kekela's obituary indicates that she was born about 1778, making her 69 in 1847 (Silva 1995:22).

3.4.3.2 Konohiki Privileges

Konohiki E. Kekela claimed that the *he'e* (octopus) was her *kapu* (restricted) fish of Hā'ena; and the *lehua* the special plant of Hā'ena.

| Interior Department Doc No. 11 (1850) (In Maly 2003:20): |                 |                     |                       |
|----------------------------------------------------------|-----------------|---------------------|-----------------------|
| <i>Aina</i>                                              | <i>Konohiki</i> | <i>'Ia Ho'omalu</i> | <i>La'au Ho'omalu</i> |
| <i>Hā'ena</i>                                            | <i>Kekela</i>   | <i>He'e</i>         | <i>Lehua</i>          |

Kekela also listed among the usual *konohiki* responsibilities, the management of 12 *ko'ele* whose names she gave as: Pākī, Kaho'okumaka, O'ahu, Kapala'a, Akole, Kaluahine, Ka'ili'ili, Pe'ekaua'i, Kalaole, Ko'i, Kanaele and Keokea. Soon after settling in Hā'ena, testimony reported that she made three *loko* or ponds within the *ahupua'a*. Native testimony does not reveal the names, locations, sites or nature of these ponds or whether these ponds are the *loko kalo* which she claimed in her application (see LCA #7949) (Silva 1995:26).

Kekela died in Honolulu in 1865 without issue. Her obituary read:

Death of an ancient woman. On Thursday, May 15, died at Honolulu, KEKELA, an aged Hawaiian female, believed to be eighty-seven years old. She was a nurse or *kahu* of the late high chief Pākī, and through a long life of upright conduct and fidelity, she has enjoyed the respect and esteem of the chiefs and all who knew her (Hawaiian Gazette June 17, 1865 p.5 c.4; In Silva 1995:29-30).

### 3.4.4 Mahele Awards in Hā'ena State Park Lands

With the exception of *kuleana* lands awarded to individual tenants, Abner Pākī was awarded the entire *ahupua'a* of Hā'ena in name only, which means that the land was not surveyed at the time. As *ali'i*, he held ultimate control over the resources within the *ahupua'a*, including water sources and products from the mountain and seas. He had twelve *ko'ele* (parcels) in Hā'ena. Eight LCA claims for Hā'ena (Figure 4) were within the Hā'ena State Park boundaries and included Pākī and Kekela as well as these below (Silva 1995:30-33):

**Haole** – LCA #7998: 8+ Lo'i 100 (f) X 25 (f), bound by Makana cliff and other cultivated lots; given to him by Mokuohai. This parcel was formerly cultivated by an older Hā'ena tenant Ho'oleali'i whose claim was not supported by Kekela who said Ho'oleali'i had returned his taro land in 1834 because he suffered poor health and was unable to maintain it [Ili of Kē'ē]

**Kanehakili** – LCA #7996: His land was given to him by Kekela in 1839; his lo'i measured 50 X 35 (f) and was surrounded by lo'i on three sides and by the beach on the other side...his house was located in Kekela's lot where he lived since 1839. [Ili of Kapihae]

**Mokuohai** – LCA #8200C/RP 7091: Mokuohai acquired his awards (house lot and pond field adjoining Loko Naia) from Kekela in the 1840s; in c. 1844 Mokuohai received Loko Kē'ē; his holdings totaled 4.25 acres 25 rods which was considered a sizable holding for Hā'ena. Upon his death, his award descended to his grandchild and heir, Kaenaku. [Ili of Kē'ē and Hā'ena]

**Naiwa/Naiui** – LCA #10941/RP 6388: Naiui received his taro lands from the *konohiki* prior to 1839 [prior to Kekela]. These lands contained 10 lo'i, a house lot adjoined them – the house lot was given to him by Kekela in c. 1839. These parcels appear to be situated in the midst of extensively watered taro lands. [family cemetery front of house cared for - 1964 photo (Major and Carpenter 2001: 19)] [Ili of Kamo'okahi]

**Poa** – LCA #10674/RP 7638: Pea was a tenant from the days of Kaumuali'i [but] his claim was supported by Kekela; he claimed a house lot, 3 large taro pond fields and 10 smaller ones. His parcel was surrounded by well-watered taro lands, bound on the seaward side by sand hills. Pea died in 1849 and his widow claimed and was awarded the parcel under his name. [Ili of Pa'akala]

**Nanahu** – LCA #8200B: Taro lands measured 20 X 15 (f); they appear to be situated between Loko Naia and Loko Kē'ē and his house lot is seaward of Loko Naia. Nanahu testified that his

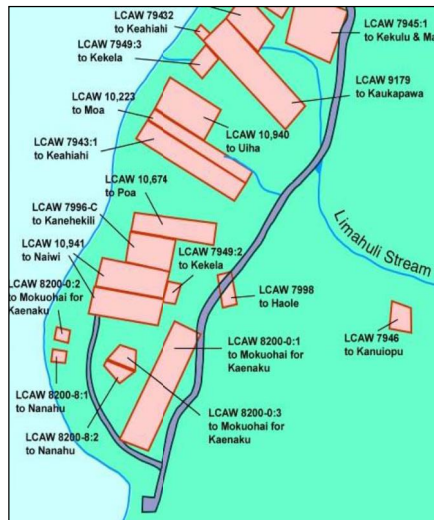

Figure 4. LCA Claims in Hā'ena State Park (Pacific Worlds).

claim descended to him from his relatives from the days of Kaumuali'i (pre-1824). He had received the land immediately from his brother who died in c. 1839. In c. 1840, Mokuohai arrived at Hā'ena, asking for a place to set up residence and plant taro. His lot was considered one of the most attractive and fertile parcels in the area. Nanahu and Kekela allowed Mokuohai use of part of the land, no gifting, however Mokuohai who may have been associated with Kekela claimed a part of Nanahu's land and was awarded this parcel. Mokuohai gave Haole land to cultivate in 1846; this land was formerly cultivated by Hoolealii although Haole claimed them in LCA 7998. Ho'oleali'i had maintained his house lot in Nanahu's parcel, thus Nanahu's *makai* parcel contained both Nanahu and Ho'oleali'i's house lots.... Mokuohai and Haole may have had an affiliation with Kekela as they both arrived in Hā'ena after 1839 when Hā'ena was under Kekela's management. Kekela testified supporting both Mokuohai and Haole claims and discredited Hoolealii. [Ili of Naia]

### 3.4.5 Hā'ena Land Transfers (Post 1855)

Royal Patent # 3596, Land Commission award 106.13, apana 6, to Abner Pākī. This is the same land conveyed by deed of William Kinney, dated January 5 1875, to Kenoe D. Kekaha and 37 others as tenants in common, owning the said entire tract of land in 38 equal shares" (Silva, 1995: 25). Abner Pākī died in 1855, his wife Konia in 1857. Their only child Bernice Pauahi Bishop inherited their lands and in 1858 sold Hā'ena to W. H. Pease (Silva 1995). The Hā'ena lands were transferred several times including to a *Hui* (co-op); the Robinson family obtained an interest in the Hā'ena Hui lands. In 1955 the Hā'ena Hui was dissolved and the State later acquired the beachfront property held by the Robinsons for use as a public park. In the late 1960s the brother of actress Elizabeth Taylor, Howard Taylor, acquired a parcel of land and a community known as Taylor Camp was established and populated by transient residents. This parcel was condemned by the State in 1975 and added to the public land bank later becoming the Hā'ena State Park (Major and Carpenter 2001:16).

### 3.4.6 Kē'ē, 'Ili of Hā'ena

Kē'ē is located at the end of Kūhiō Highway and includes the beach, canoe landing, trail to the *heiau* and *hula* platform, sand dune, comfort station, Kalalau Trail Head (foot/livestock trail) and Lohiau's house site, taro and sweet potato cultivation and at least one fishpond (although it could have been a *loko i'a kalo* – a pond for both taro and fish cultivation). The abundant resources of the area, both *mauka* and *makai* once supplied a good sized population in pre-contact times, most likely a permanent settlement, as indicated by archaeological cultural remains (Major and Carpenter 2001:16).

However, historic human activity and natural disasters such as the 1946 and 1957 tsunamis greatly modified these lands and destroyed settlement evidence. The traditional oral histories (e.g. Lohiau, Laka, Pele & Hi'iaka, etc.) of the area illustrate that Kē'ē was once a very sacred and special place, a *wahi pana*, where deities and *ali'i* co-mingled and where sacred rituals (e.g. *'ōahi*, Laka's *hula pā*, *hula halau*, *heiau*) were conducted. For some reason by the 1930s when E.S. Craighill Handy visited, much of the cultivation of the greater Hā'ena had been scaled back with limited terraces in Kē'ē still functioning.

The sloping and flat lands east and west of Limahuli Stream between the sand dunes and the mountain sides were developed in terraces irrigated by ditches from Limahuli Stream. About a dozen of these terraces are now under cultivation in taro. The rest are used as pasture or abandoned under brush and grass (Handy 1940; Major and Carpenter 2001:18).

By the mid-1960s Loko Kē'ē and Loko Naia were abandoned and only a few taro *lo'i* were still being cultivated. However, by 1967 the last taro crop was harvested in Kē'ē. The taro terraces would remain fallow until 2000 when a group, *Hui Maka'āinana O Makana* began to restore old taro *lo'i* (Major and Carpenter 2001: 19).

Today Kēʻē is a tourist destination where as many as 10,000 tourists visit in any given week (Major and Carpenter 2001:19). They come for the scenic drive, but mostly for the great snorkeling at its protected lagoon and its sandy beach. They also come for the hiking adventures to nei ghboring Kalalau Valley (11 miles) and visits to the wet caves (Waiakanaloa and Waiakapala'e).

Photo 18. Kēʻē Beach and Kai-kua'au-o-Hā'ena Lagoon

### 3.4.7 Other 'Ili Names of Hā'ena

The following 'ili names of Hā'ena are based on the database of *Waihona 'Aina*: Ha'aheo, Hāli'i, Kahakaheana, Kahau, Kaia/Koia, Kaia 'aimokua, Kalokomaikai, Kaloli/Kālole, Kamo'oloa, Kanulau, Kaoneana, Kapihae, Keleke, Kiwaa, Kupapaululu, Lalaole, Mahau, Makanaulua, Mo 'olalaole, Naia (fishpond), Pa'akala, Pahole, Pe'ekaua'i, Pu'ukahua, Puukoka, Waikapu.

### 3.5.0 Hā'ena State Park Land Resources and Use (Traditional and Historic)

The following map (Figure 5) depicts some of the traditional and historic resources in Hā'ena.

Figure 5. Map illustrating resources within Park boundaries (Pacific Worlds).

#### 3.5.1 Hā'ena Pu'uone (Dune-banked Ponds)

Among the significant natural features in Kēʻē are the *Pu'uone* (dune banked ponds), called Loko Kēʻē and Loko Naia. The ponds, referenced in *kuleana* claims, 8200 B and 8200 C, were modified for cultural subsistence uses in antiquity, and remained in use through the early 1900s as fishponds and taro pond fields (In Maly 2003:34). One claim in the area generally is known as Kēʻē; specifically, the area of Loko Kēʻē (Helu 8200 C) (In Maly 2003:8).

**8200 B Nanahu** at Hā'ena, Kaua'i. House lot, kula and *Loko* "Naia". *Loko Naia* (Naia Fish Pond) is bounded *mauka* by *Loko Kēʻē* and *makai* by sea beach.

**8200 C Mokuohai** at Hā'ena, Kaua'i. *Loko Kēʻē* in the *ili* of Kēʻē; bounded *mauka* by *Waiakapalaie pali*; *Napali* by sea beach; *makai* by sea beach (In Maly 2003:18).

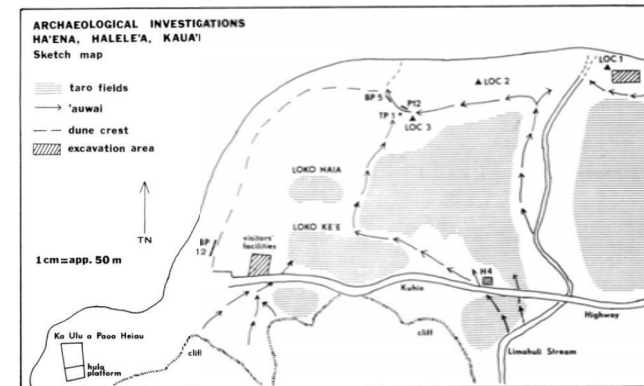

Figure 6. Map of dunes, fishponds, taro pondfields and 'auwaisystems (Griffin 1984: 9)

#### 3.5.2 Sand Dune Habitation

Previous studies revealed the presence of household floors, hearths, *imu*, post holes and an array of midden and artifacts in the dunes and in the flat land between the bay and Loko Kēʻē (Griffin et. al. 1977, Hammatt et. al. 1978 In Major and Carpenter 2001:131).... It appears that habitation was concentrated along the dune crest (i.e. *makai* of the present unpaved access road to the poi mill area), spreading out at the west to occupy the whole flat area between Loko Kēʻē and the bay. Habitation of this area did not cease with the dissolution of the Hā'ena Hui, although the population did change radically (Major and Carpenter 2001:134).

#### 3.5.3 Taro Lo'i

Land registry and testimony numbered well over 150 taro pond fields of varying sizes and shapes in Hā'ena. Of these 40 or so were situated within the Park site. That Hā'ena was well -developed and productive is unquestioned. Its water resources and available cultivable lands appear to be utilized maximally (Silva 1995:35). Lo'i restored in 2000 by Hui Maka'āinana. [See below 3.7.14]

Photo 19. Taro Lo'i in Hā'ena State Park

Photos 20-22. Evidence of burials on Parks lands

### 3.5.4 Burials

In August of 1994, the Hawai'i DLNR Division of State Parks conducted a community meeting to gather input for a proposed Hā'ena State Park Master Plan. At this meeting, concerns were expressed regarding the neglect of known burial sites within the park. These burial areas are known to local lineal families who formerly lived in what is today Hā'ena State Park. Some of these areas were formerly landscaped and maintained, leading to their slow deterioration. Some of these burials are as recent as 30 to 50 years old. The family burials are concentrated in one area within the boundaries of the park identified as a cemetery (State site #50 -30-02-1892). Also the coastal dune system, a portion of which runs through the park, is a known burial area: some burials were located during previous archaeological testing and others have been exposed as a result of erosion. This pattern suggests a high potential for additional burials to be exposed in the future. The descendant families requested that a joint effort between the families and the Division of State Parks be initiated to stop further deterioration and natural destruction, and to restore a sense of respect to these sacred areas (TKCH 2001:1-12-13).

#### 3.5.4.1 Dune Burials

Sand dunes were considered "the most reasonable place for internment" for the Hā'ena commoners other than within the family house lot. "Hā'ena's fairly sizable resident population through time would be reflected in more than moderate burial activity in the sand dunes.... Tidal and human impacts have negatively affected these dunes and will continue adversely unless policy, planning and enforcement measures are established" (Silva 1995:18-19).

Photo 23. Part of Dune System in HSP

#### 3.5.4.2 Hā'ena Cave Burials

Given Hā'ena's physical environment, one would expect customary royal internment in hidden or inaccessible areas on the steep cliffs. Numerous caves pock-marked the cliffs of this coastline thereby providing natural tombs for the chiefly class. Mythology verifies this practice in Hā'ena; Prince Lohiau was entombed nearby in a cliff cave until revived by Hi'iaka. It is possible and even likely that others of chiefly status have found a final resting place within these cliffs (Silva 1995:18).

### 3.5.5 Hā'ena Caves as Places of Interest in 1800s Literature

The editor of "*The Hawaiian Kingdom Statistical and Commercial Directory and Tourists Guide*" (1880) George Bowser, wrote about various statistics and places of interest around the Hawaiian Islands. The

following excerpt from "An Itinerary of the Hawaiian Islands" offer descriptions of the communities and various attractions of the Halele'a region (In Maly 2003:35), especially Hā'ena.

From Hanalei I rode out to Hā'ena, which is at the northeast corner of the island, and is distant from Nawiliwili about forty-four miles. The land in this neighborhood is very sandy, and does not seem likely to be turned to account for any purpose but pasture. Two curious caves have been found near here. One of these, called by the natives Kanaloa, which means "the wife of the devil," has no floor except the water which lies in it, the depth of which no one has yet succeeded in fathoming. At its mouth this cave is about sixty feet wide and twenty feet high, and from these dimensions the sides and roof gradually draw in, with a gentle curve, until there is only six or eight feet either way above the surface of the water. The full extent of the cave has never yet been explored. Its walls are perfectly smooth, and their curved surfaces are so perfect that they might have been cut by the hand of man. The other cave is dry, and is not far from Kanaloa. It is called Maninihola, and is about forty feet long, twenty feet high at the entrance, and gradually diminishing to about six feet at the inner end. The natives used to have various stories about monsters which inhabited these caves, but it is now impossible to find any connected story in what they tell you.

The editor of the *Hawaiian Gazette*, Henry M. Whitney, published a "Hawaiian Guide Book" in 1875 and 1890. The publication was produced as one of the early promotional guides to encourage visitation to the Hawaiian Islands, and included descriptions of the islands, agriculture, plantations, scenery, climate, population, commerce, and places to stay while visiting. His publications provided readers with commentary on traveling the old road ways through Hanalei and Nāpali and included several "traditions" of storied places on the landscape (In Maly 2003:36-38).

The wonderful caves, Waiakanaloa and Waiakapala'e, are about ten miles from Hanalei. In the early days of Hawaiian history, it is said, a brother and sister came from a foreign land, in order to supply the people with water, of which there was a great dearth. They came to a mountain, and determined to dig into its side until water would be discovered. Kanaloa, the brother, selected a spot where he thought he would find water, and after digging a long time detected a lake, whose waters he caused to flow over the land, and to this day the taro patches are irrigated from this source. Visitors are escorted into the arched entrance, and to the lake within. Here the natives light torches, and take the tourist for a row upon the water, which is cold and clear and fresh. At the entrance the depth of the water is forty - two feet, though further in it is said that no bottom has been found.

Photo 24. Waiakanaloa Cave

A strange sensation, a combination of awe and fear, creeps over one as daylight is left behind, and the frail bark glides into the blackness of night, and seemingly into the very bowels of the earth. The black waters reflect the ruddy glare of the torches, and the flickering flames throw strangely contorted shadows upon the rocky sides and ceiling of the cavern, while the half-nude forms of the rowers look weird and unearthly. Even the most frivolous scarcely speak a word, and then only in the faintest whisper, and it is with a long-drawn breath that the traveler steps out of the darkness into the light, but also with an impression that lasts for life.

Photo 25. Waiakapala'e Cave

The other cave, which was dug by Kapalae, has also an arched entrance, and though much smaller than the first cave contains a lake whose waters are ever covered by a thin film. There is a third cave, known as the "Dry Cave," which one can enter and walk through, or can ride into on horseback. A few seconds walk into its depths brings one beyond the reach of daylight, and no one has ever ventured further within its gloomy recesses. A foreigner could not find his way out, and a native could not be persuaded to enter, because it is said that a gigantic moo (dragon) guards the cave. We are told that the ancient high chiefs of Kaua'i were buried there, far under the mountain, and that many priceless feather cloaks and feather helmets might be found. In speaking of the largest cave, the *Hawaiian Spectator* said: "Its entrance is gothic, from twenty to thirty feet high, and as wide. The entrance to the second compartment (or lake), is also gothic, and one half as large as the other opening. The first chamber is about 150 feet long, 100 feet wide, and sixty feet high, the whole forming a beautiful arch."

3.6.0 Hā'ena Demographics of mid-1800s.

The missionary census of 1835 and 1847 a disproportion between the number of children and adults (Schmitt 1973:46 In Silva 1995:21):

| 1835      |     | 1847*     |                   |
|-----------|-----|-----------|-------------------|
| Adults:   | 100 | Adults:   | 108               |
|           |     | Male      | 46                |
|           |     | Female    | 62                |
| Children: | 16  | Children: | 54 [up to 20 yrs] |
|           |     | Male      | 30                |
|           |     | Female    | 24                |
| Deaths:   | 4   | Deaths:   | 10                |
| Births:   | 1   | Births:   | 2                 |

\*At this time [1847] Hanalei's adult population was 376 and children 146; Kalihiwai was 156 and 54; Wainiha was 153 and 63; and Kalalau was 115 and 16 (Silva 1995:23).

3.7.0 Previous Archaeological and Other Studies: Hā'ena and vicinity

As early as 1931 Bennett voiced this observation: "Unfortunately the continuity of culture on the Island of Kaua'i is broken. The older natives who still remember heiau (temples) are fast dying, and the younger generations are no longer interested" (Bennett 1931:3).

At the western edge of Halele'a, just on the border with the Na Pali District, lies Hā'ena, also the scene of considerable intensive archaeological study (Griffin et al. 1977; Hammatt et al. 1978; Griffin 1984). Earle (1978) mapped several large irrigation complexes that lie just inland of a large sand dune fronted by Kē'ē Beach. Excavations by Griffin, Hammatt, and others have revealed that these dunes incorporate well -stratified occupation deposits, with many superimposed cultural strata. Unfortunately, no radiocarbon dates are available, but a series of hydration -rind age determinations on volcanic-glass artifacts suggests occupation as early as the tenth century and continuing up until historic times. A number of relatively early artifact types were also recovered, including porpoise-tooth pendants and incipiently knobbed two -piece fishhooks. Hammat et al. (1978:168) outlined a tentative sequence for the Kē'ē Beach site. They believe that the first phase consisted of a 'transient marine-oriented' fishing settlement. By about A.D. 1200 there was a 'population increase with a broader resource base,' and settlement expanded inland. The 1400s witnessed 'the development of intensified irrigation agriculture in inland areas with a continued use of the littoral environment,' a pattern that evidently continued up until the historic period. The archaeological potential of the Hā'ena area, with both the stratified Kē'ē Beach deposits and the extensive irrigation systems inland, has just begun to be tapped and future work in the region may reveal much about the development of Hawaiian society in this part of Kaua'i (Kirch 1985:101 - 104 In Silva 1995:14).

3.7.1 Thrum (1907) "Tales from the temples" In *Hawaiian Annual for 1907*.

3.7.2 Stokes (1908, 1909, 1927) Various studies.

3.7.3 Emory (1929) "Ruins at Kee, Hā'ena, Kaua'i: Famous Court of Lohiau" in the *Hawaiian Annual of 1929*, Emory provided the descriptions for many of the sites listed in Bennett (1931) below.

3.7.4 Bennett (1931) *Archaeology of Kaua'i*. Bennett conducted his field work of Kaua'i archaeology in 1928 -1929, "supplemented by a study of available collections, of published literature, and of manuscript notes on file in Bernice P. Bishop Museum" (Bennett 1931:3). Bennett (1931:60-69, 95) notes that various artifacts found are unique to Kaua'i such as the curved adze, gouged stone implements, polished stone knives, and Kaua'i pounder (ring, stirrup, and block), block grinders, the broad tapa anvil, makaloa sedge mats (Ni'ihau and Kaua'i ), and decorated gourds or ipu (Ni'ihau and Kaua'i ). [Hā'ena sites cited above].

### 3.7.5 Handy & Handy (1972) *Native Planters in Old Hawai'i: Their Life, Lore, and Environment.*

Almost certainly the first settlers chose protected bay and beach areas where fresh water was available and there was good inshore and off shore fishing...it would seem, if we accept the evidence of the story of P'ele and her clan, that this (Kaua'i) was the first landfall of at least one group of early settlers (Handy & Handy 1972:268).

### 3.7.6 Griffin et. al. (1977) *Preliminary Archaeological Investigations at Hā'ena, Halele'a, Kaua'i Island*

The first survey and testing program began in 1977 under the direction of the author (Griffin et al. 1977). The most westerly portion of the dunes and back dune areas, and the terrain west of a transect running from the east edge of 'Iloko Ke'e to the outlet of the 'auwai (ditch) by BP5 was closely examined on the surface. In addition, test excavations, coring, and profiling of seaward dune faces was completed. Several backhoe trenches were placed where stratigraphic data might be retrieved. Since complex stratification was apparent in the dune, special efforts were made to understand the depositional history and geoarchaeology (In Griffin 1984:2).

### 3.7.7 Earle (1978) *Economic and Social Organization of a Complex Chiefdom: The Halele'a District, Kaua'i, Hawai'i.*

### 3.7.8 Hammatt et.al. (1978) *Archaeological Investigations at Hā'ena State Park, Halele'a, Kaua'i Island: Phase II: Excavations of Beach Localities and Visitors Facilities Area.*

### 3.7.9 Riley and Ibsen-Riley (1979) "Taylor Camp, Hawaii: The life and death of a hippy community" *Field Museum of Natural History Bulletin* 50, 18.22

### 3.7.10 Riley and Clark (1979) *Archaeological Testing and Excavations at Hā'ena, Kaua'i.*

During the summer of 1978 a combined University of Hawaii-University of Illinois (Urbana) Field School was held at Hā'ena. Griffin coordinated the project, while Thomas Riley directed the effort (Riley and Clark 1979). Riley worked at three "localities", each in beach deposits (Fig. 1). Two, localities 2 and 3, are in eastern and central portions of the park. Locality 1 is to the east of [6] Limahuli Stream, on the property of Mr. Barlow Chu. Riley and Clark opened horizontal test excavations as well as test squares and profiles (In Griffin 1984:2).

### 3.7.11 Hammatt and Meeker (1979) *Archaeological and Ethnohistorical Investigation at Hā'ena, Halele'a, Kaua'i Island.*

Riley's work on the Chu property was followed by further excavations in the high dune beside the stream and by surface mapping and ethnohistorical study (Hammatt and Meeker 1979a, 1979b). The work of Hammatt and Meeker was especially interesting, given its richness in data of historical archaeology. Hammatt, building on maps by Earle (1978) drawn in 1973, further mapped the historic remains of the Chu homestead and adjacent taro fields. These features ranged from the present road *makai* to the dunes (In Griffin 1984:2).

### 3.7.12 Yent (1980) *Preliminary Archaeological Testing of House 4, Hā'ena State Park, Halele'a, Kaua'i.*

Martha Yent (1980) conducted emergency mapping and salvage research of a *mauka* house platform, house #4, found near the road among the taro fields. While her project was necessarily limited by salvage constraints -- a simple assessment of damage done by laying water pipe -- her report has important implications for the Hā'ena settlement and agricultural systems (In Griffin 1984:2).

### 3.7.16 Major and Carpenter (2001) "Supplemental Archaeological Inventory: Hā'ena State Park, Kaua'i TMK: 5-9-06:14 and 5-9-08:1 through 19." Map below of sites inventoried (Figure 7).

Much of the archaeology done in Hā'ena has been on buried sites in the coastal flat, primarily because this is where houses have been built in the last two decades. Surface features are common in the valleys (Mānoa and Limahuli -- agriculture and habitation), but the coast has very few. Archaeologists have not dwelt upon this pattern and it is not clear whether the lack of surface features reflects the original settlement pattern (post structures without rock walls), post abandonment deposition of sand that has buried features, or historic removal or disturbance of surface features.... Archaeological excavations have failed to demonstrate that walls or platforms were common in the coastal area. Instead, it appears that although stone lined pits and pavements may have occurred, above surface features may not have been a major part of the coastal settlements. What has been recorded numerous times is the presence of fire pits, refuse pits, and one or more strata rich in charcoal, midden and artifacts. These appear to be present...in the Kē'ē dunes [pg 23].

Unfortunately, the archaeology that has been done is in response to development of particular private parcels; therefore the overall distribution is not known and what we have to go on are sporadic glimpses. Although the general opinion is that habitations were dispersed along the shore, rather than clustered in villages, burials seem to be concentrated in certain locales and had yet to be demonstrated that clustered habitations did not exist [pg 25].

Cultural deposits in coastal sands vary in age, but there are enough dates to show that Hā'ena *makai* was occupied by about A.D. 1300-1400. The earliest date (AD 252-549) fits the belief that Hā'ena would have been an attractive area for early settlement, but even the authors suspect the date's bias.... The A.D. 900-1100 dates for Kē'ē (Hammatt et al 1978) are invoked as justification for assuming occupation of the rest of Hā'ena, despite the fact that Kē'ē dates are based on volcanic glass and derive from a different valley catchment. There appears to be a strong willingness to accept the model proposed by Hammatt in 1977 saying that transient fishing camps began before AD 1000 and coastal settlement occurred in the 1200s [pg 26].

Figure 7. Recorded Archaeological Sites in Hā'ena (Major and Carpenter 2001:24)

Earl (1978) described the general settlement pattern in which inland *lo'i* complexes used all available land down to just behind the coastal dunes, with habitations occurring on and just behind the dunes. Historically, Land Commission data indicate a pattern of [pg 26] habitations dispersed amid the *lo'i*, but still with the majority of habitations located closer to the coast than to valley interiors [pg 27].... Field terraces immediately *makai* of the main road and on the west side of Limahuli Stream were mapped and tested, [and] showed evidence of both wetland and dryland cultivation. Three *mauka-makai* divisions of the project were identified, based on historical *kuleana* boundaries, morphological differences in features, and modern vegetation patterns. On either end, excavations revealed *lo'i* sediments, whereas the middle section lacked such a layer and contained an *imu* indicating at least temporary habitation.... Charcoal from the *imu* suggested occupation as early as AD 1050, well before the AD 1400-1500s dates from other excavations that were interpreted as beginning the wetland field system (Calis 2000:3132, 35) [pg 29].

The Phase I *lo'i* e complex [Figure 8] consists of 42 features, the majority (38) of which were irrigated pond fields; Features 1 and 40 are *'auwai*; Features 41 and 42 are habitation features. Feature 1 at one time brought irrigation water from Limahuli Stream to System A, while Feature 40 is a large ditch that drained System B with runoff flowing into the ocean on the north/northeast preventing stagnation and flooding of the coastal dune habitation system. System A is bordered by the *'auwai* (Feature 1) on the north and by the main road on the south. The original construction of the road (ca. early 1900s) most likely impacted this *lo'i* e complex [pg 51]. The terraces within this Phase I are not the entire system; there were more terraces westward eventually draining into Loko Kē'e (65 meters west), a combination agricultural/aquacultural feature with no apparent outlet. System B is bordered on the south by the *'auwai* (Feature 1) and on the north by *'auwai* (Feature 40). Remnants of a Poi Mill (Site 7014), is just outside of this Phase I survey area [pg 53].

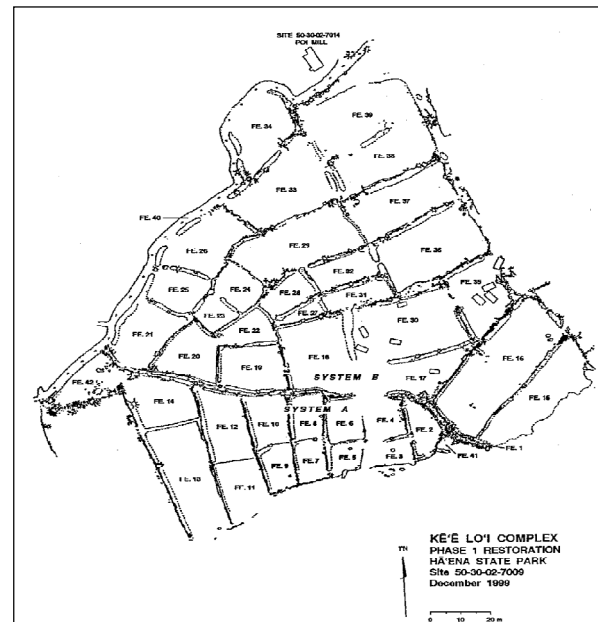

Figure 8. Kē'ē Lo'i Complex, Hā'ena State Park (Major and Carpenter 2001:52).

Photo 35. Part of Restored Lo'i System in Hā'ena State Park.

Subsurface testing included test units, stratigraphic trenches (6), a backhoe trench (near the extreme of the project), and shovel probes [pp 49 -50]. Several charcoal samples were submitted for dating. The results yielded several date ranges: AD 1270 -1410; AD 1320 -1350; AD 1390 -1440; AD 1440-1480; AD 1440 -1640; AD 1470 -1660; AD 1490 -1600; AD 1520 -1590; AD 1620 -1680; and AD 1730-1810 [pg 112-113].

Fishing and canoe-making artifacts recovered on the surface provided evidence of marine subsistence activity. Prismatic blades, basalt flakes and an adze fragment all indicated that work occurred amid the fields, but without sufficient resolution to interpret specific activities.... Together, the artifacts yielded the unsurprising information that non-agricultural activities occurred in or near the western edge of the project area [Phase I - lo'i].... But since excavations were not performed in the middle of [the] field, it would be unfair to say that such artifacts cannot also be found away from the banks. Blades and flakes would be useful tools for preparing *huli* (propagative cuttings) and cleaning harvested corms, so their presence should not be interpreted as evidence of non-agricultural activity [pg 138].

### 3.7.16.1 Chronology of Kē'ē Site 7009 [Agricultural System] [pp 148-149]

- |              |                                                                                                                                                                                                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AD 1300s     | Irrigated agriculture begins at Kē'ē as early as the late 1200s... "intensive" irrigated pond fields are the first form of agriculture here                                                                                                                                |
| AD 1500s     | Existing fields at Kē'ē are overhauled. Large fields are subdivided and the current <i>auwai</i> is constructed. Activity appears to be system-wide and appears to differ from simple repair and rebuilding of fields that have been inundated by flood or wave sediments. |
| AD 1830-1875 | Boundaries of fields change and water flow is probably rerouted and managed differently as Kekela, a non-Kaua'i chief, becomes <i>konohiki</i> . Several land claimants in the area arrived during her tenure.... Abner                                                    |

- |              |                                                                                                                                                                                                                                                                                                                                              |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AD 1875-1955 | Paki received all portions of Hā'ena not otherwise claimed<br><br>Most of the <i>ahupua'a</i> of Hā'ena is sold to a Hui of native tenants in common. Parcels now correspond to shares in the Hui.... By the 1930s, farming has declined and the tsunami of 1946 kills many residents and causes others to stop farming.                     |
| AD 1955-1967 | Members of the Hashimoto <i>'ohana</i> are the last to farm the fields of Site 7009. Although some modern machinery is used for certain tasks, cultivation methods are essentially the same as those used traditionally. Hui parcels are sold off in a piecemeal fashion by many owners.                                                     |
| AD 1968-1975 | Taylor Camp commune, a hippie settlement, occupies what is now the central area of the park. No further cultivation of taro, and the <i>auwai</i> is abandoned. Population fluctuates and farming consists of small, unirrigated gardens on the old terraced fields. Perhaps for the first time, residents do not rely on local subsistence. |
| AD 1975-2000 | The State of Hawai'i condemns land west of Limāhuli Stream, evicting Taylor Camp residents so that the land can be developed as a State Park. Parking and restroom facilities are built and other land use is limited to squatter camping, fishing and recreation, all of which are oriented to the shoreline.                               |

### 3.7.16.2 Significance Evaluations

Aside from modern additions... all of the features within the project area [Phase I] are significant under NRHP and SRHP criterion D and certain features are significant under Criterion E of the State of Hawai'i criteria due to their cultural significance to Native Hawaiians [*auwai*] [pg 150].

### 3.7.17 Dye (2002) "Archaeological Assessment for a Residential Lot at Hā'ena, Kaua'i (TMK:5.9.02:62)"

The assessment included a brief field check of the parcel to document existing conditions and an extensive review of maps and other documents to determine the likely presence or absence of unrecorded historic properties. Information on historic land-use patterns before, during, and after the *māhele* is presented, as are the results of archaeological surveys at Hā'ena Point and in the vicinity of the residential lot. The archaeological information is synthesized and used in conjunction with information on land-use patterns to formulate expectations for inventory survey results.

#### 4.0 ETHNOGRAPHIC SURVEY

The Ethnographic Survey (oral history interviews) is an essential part of the Cultural Impact Assessment (CIA) because they help in the process of determining if an undertaking or development project will have an adverse impact on cultural properties/practices or access to cultural properties/practices. The following consultant selection criteria were initially considered:

- ❖ Have/Had Ties to Project Area
- ❖ Known Hawaiian Cultural Resource Person
- ❖ Referred by State Park staff
- ❖ Referred by NTBG-Limahuli staff

Both State Park and Limahuli Garden staff had names of *kuleana* land awardees, lineal descendants, cultural practitioners, well-known historians and long time residents of the project area and vicinity. An effort was made to contact people from each category.

The consultants for this Cultural Impact Assessment were selected because they met the following criteria: (1) consultant grew up, lives or lived in the vicinity of the project area; (2) consultant is familiar with the history and *mo'olelo* of Hā'ena and vicinity in general; (3) consultant is a known Hawaiian Cultural Practitioner in the project area/vicinity; (4) consultant is a lineal descendant of *kuleana* lands; and/or (5) consultant was referred by Staff of Limahuli Garden or State Parks (see Demographics Table 3 below). Copies of signed "Consent" and "Release" forms are provided in Appendices H/I.

##### 4.1.0 Research Themes or Categories

In order to comply with the Scope of Work for this cultural impact assessment, the ethnographic survey was designed so that information from consultants interviewed would facilitate in determining if any cultural sites or practices would be impacted by the implementation of the proposed *Hā'ena State Park Master Plan and Environmental Impact Statement* (Job No. F74C664A). To this end the following research categories or themes were incorporated into the ethnographic instrument: Consultant Background; Land, Water, Marine and Cultural Resources and Use; Anecdotal Stories; and Project Concerns. Except for the 'Consultant Background' category, all the other research categories have sub-categories or sub-themes that were developed based on the ethnographic raw data or responses of the consultants. These responses or clusters of information then become supporting evidence for any determinations made regarding cultural impacts.

##### 4.2.0 Consultant Background

The project and the CIA process was explained, then after signing the consent form, each consultant was asked to talk about their background; where they were born and raised, where they went to school and worked, and a little about their parents and grandparents. This category helps to put the person being interviewed at ease, establishes their connection to the project area, their area and extent of expertise, and how they acquired their proficiency. In other words, how the consultant met the research consultant criteria.

The consultants either have family ties to the project area and vicinity and/or are familiar with the history of Hā'ena State Park and vicinity. Six people were interviewed; all are part Hawaiian. Four were interviewed in their homes (one in Hanalei, one in Wailua, one in Kilauea and one in Honokua, South Kona); one was interviewed at Limahuli Garden and one was interviewed at NTBG office in Kalāheo. Efforts were made to interview three more, but there were no responses to emails or telephone messages.

Table 3. Demographics for Hā'ena State Park CIA Interviewees (all are part-Hawaiian)

| Interviewee        | YOB  | B/R           | Lived/Lives/Works | Connection to HSP                                 |
|--------------------|------|---------------|-------------------|---------------------------------------------------|
| Alquiza, Kapu      | 1954 | O'ahu/Anahola | Hanalei (CP-H)    | Ke Ahu a Laka – cultural practice                 |
| Hashimoto, Thomas  | 1934 | Hā'ena        | Hā'ena (CP-F)     | Fishing; <i>lo'i kalo</i> ; <i>ohana</i> history  |
| Medeiros, Clarence | 1952 | Kona          | Kona (CP-T/LD)    | Descendant of Mokuohai ( <i>kuleana</i> land)     |
| Wichman, Chipper   | 1957 | O'ahu/Kaua'i  | Hā'ena (M)        | Limahuli; Hā'ena <i>lo'i kalo/mo'olelo</i>        |
| Wichman, F. Bruce  | 1927 | O'ahu/Wailua+ | Hā'ena (M)        | Limahuli; Hā'ena <i>mo'olelo</i>                  |
| Wichman, Randy     | 1957 | Wailua/Hilo+  | Hā'ena (CP/M)     | Limahuli; Hā'ena <i>mo'olelo</i> , cultural sites |

CP = Cultural Practitioner; H= Hula; F Fisherman; T=Taro Farmer; LD = Lineal Descendant; M = Mo'olelo (history expert)

##### 4.2.1 Kapu Kinimaka Alquiza (Kumu Hula)

[This interview was disrupted when Kumu Kapu had to leave to pick up a grandchild; the follow-up scheduled interview did not work out.] I don't know why my parents named me this but my mom and dad both married twice, my mom had ten children and my dad had from his previous marriage had six, so they had sixteen children...we were all raised together. My mom had three children from her previous marriage, and then came us 7 kids after that. My dad had the six children before the second batch came around. I'm from the second batch. That's how we distinguish ourselves with each other, first batch and second batch. But anyway, I was actually born on O'ahu, and at a very infant age my parents moved to Kaua'i - I was the youngest at the time, so my [younger] brothers and sisters...four of them, were born on Kaua'i. I was the youngest at that time moving from Honolulu to Kaua'i, so I knew nothing of Honolulu, actually. My dad inherited the first batch of children, and when he met and married my mom, she raised the first batch of his and her children. When my parents moved to Kaua'i (1954) they lived down at Nawiliwili, near the Marriott - that's where we were raised; and the rest of my brothers and sisters were born there.... I think it was 1963 or 1962 when we moved away from there to go to Anahola - in 1963 my mom got awarded a Hawaiian Homestead in Anahola...we stayed there until we all graduated from high school, married, and left the home. Prior to St. Catherine's I went to Immaculate Conception School in Lihue from kindergarten to fifth grade and then St. Catherine's from sixth grade until eighth, and then Kapa'a High School from ninth to graduation. Gee I'm amazed I can remember those days. Of course some of the kids came after, so we never had all sixteen children in the house at the same time. Some grew older and went off to their specific destinations, and others came and took their spot. Life has really passed for my mom and my dad.... My mom is Ellen Pai Kinimaka. My great great grandfather's name was Keawemahi Kinimaka; he married Kawahine Pai is what I know her as, I don't really know her first name, but she was from Borabora.

My dad, Joseph Kamanua Kinimaka, was a glaze tile setter; he was one of the first here on Kaua'i, which was really cool at the time, but of course we really didn't know it yet. Then for his recreation he was a falsetto singer, and a steel guitar player. So his first batch of sons became great entertainers in Honolulu.... We have a cousin who's been doing the family genealogy for over ten years. I was just amazed when we all came together as a family and she busted out this chart, and generations going far back to Umi and Liloa and so forth and I'm like 'holy cow!' My great-grandfather was David Leleo Kinimaka; he was commander in chief to King Kalakaua's guard; he was a Lt. Major. We have documentation on his life too. I don't know my grandpa or my grandma, but my cousin found a lot on his father; so our great-grandfather and great-great-grandfather, and great-great-great-grandfather! My last grandson is named after my great-great-grandfather. Anyway, my dad is from Kona and he was raised in an orphanage, so I don't know much about my grandpa and grandma. He met my mom there in Kona, and moved to O'ahu and living in some really poor districts of O'ahu.

After high school - I was kinda active in high school stuff and did a lot of traveling during high school for Aloha Airlines and Ala Moana Hotel -- we were promoting both the airlines and the hotel during my four years of high school. My kumu was a great kumu and he was asked to take on this responsibility of promoting the islands, and so he selected a few of his dancers within his halau - he was Manu Gonzalves. I was really young, but I was always told I looked old kind a - like mature looking, so I guess I was fortunate that that happened because I got to see the east, west, and Midwest of the mainland; Canada, New Zealand, Australia, all those beautiful places. I know I would never have been able to see these through family travels because of our situation of having so many children, you know how that goes. So I was so blessed- not only me - I had other sisters; there were five of us, so all five of us had the privilege of going to different parts of the world through hula, through promotion of our islands etc....all the way through high school...some of us after high school. I went to college and another went off to continue dancing and traveling, and stayed with our kumu until he moved away. We started out with Auntie L. Ovey Apana when we were little, and she did get a few promotions but we were babies then, but we did most of the island kind of performances. Then when we got bigger and moved to Anahola, my mom took us to Uncle Joe Kahaulelio who was in Kapa'a, so we went to Uncle Joe when I was in the sixth or seventh grade, we stayed with him until we were all out of high school. He was the one that actually took us around the world. It was a good thing that my mom pushed us to keep hula because she just believed that we needed to be part of hula. My mom was a kahiko dancer and to her it was important that we did hula...she danced *auana* too.

I danced at age five with my sisters. I went to high school, got married at age 20, my first son at age 21, my second son at age 24, and my daughter at age 27 I think. I started teaching when I was part of a halau here on Kaua'i that was going to enter the Merrie Monarch Festival, they asked me to come and be part of it and I did. My daughter was two years old at the time, and so I did what my mom did, bring her along and get her to find some interest in the dance. Lo and behold as I was practicing for the whole year with this halau, she was two years old and I sat her in the back, and I said okay mom is gonna practice, you stay here and you watch or dance. She ended up dancing in the back at age two.... Kumu Lake became my kumu at one point, and then he passed away. I called him my kumu although he wasn't officially my kumu, but he took me into his home and shared mele, history, and stories.... And there was this other gentleman, he wasn't my kumu, he's a haole guy that was raised by a Hawaiian family on Lanai, my dearest friend, Kepa Maly. And he is sooo knowledgeable; I love him dearly. Today, I'm so happy because he was here on Kaua'i, married a Kaua'i girl and they lived here and then he moved to Big Island. But when he was here on Kaua'i, he worked with me in my halau. And it's that kind of people that I like, Kumu John and Kepa, that kind of people we get drawn together. They're just all true, real people. When he was on Kaua'i, he educated me on so many places on our island. He got me interested in reading more about Kaua'i, our home. I said wow I've been missing out on all these things! And then he moved away.

\* \* \*

**4.2.2 Tom Hashimoto** I'm Tom Hashimoto and I was born (1934) and grew up in Ha'ena with my mom and dad and my brother Joe Hashimoto. My mother was Dora Poe Hashimoto; she was born in Makua on O'ahu, and my dad was born in Napo'opo'o on Hawai'i. I lived in Ha'ena 41 years. Actually I bought this house [in Kilauea] and moved away in 1973 to Princeville, and moved up in this area [Kilauea] in the 1970s when I bought this house. My father worked for the County and my mom worked in the cannery during the summer months...Hawai'i Food Packers. I went to school when we came to Ha'ena -- think we were the last class in Ha'ena -- you don't know the area so it's kinda hard for me to explain. The place is all *kamani* bush. Well, right in between there from Kapuhi to that one near Kuhao, it's right between there that's where the school is...on the mountain side, right where you know that big open lot, that nice open

lot down after you pass Kapuhi and the houses, it's right next to that, but they all covered with *kamani* trees that area. After that to Kapa'a High School, but I never graduate because I went to work to help support the family because my two brothers were in Korea at the time, was war time eh? And then for the Army not taking me, I went to join the National Guard in 1950 to help support my dad. I went to work here and there like the cannery, indoor kind...at the time job was scarce in 1950 and then I worked for McBride for five months in 1954 I think, and then after that I worked for Julia Wichman -- I worked at their house property in Ha'ena. I would be asked to do all kinds of work by Mrs. Wichman and doing all that because I was employed by her. I worked for her and then in 1968 we were called -- the Unit and they took us to Honolulu because we got activated. So I went away for two years. And then while I was in the service, because Mrs. Wichman was paying me my wages while I was away, I figured I owe her something so I came back and worked for her, although my mind was so in the career, in the service because I had 18 years, but because of that I came home and then I was working at the Hanalei Plantation Hotel (overlooking Hanalei River mouth) - worked over there until 1962 until the time that place closed. [Club Med] that's the place and we worked the club too.

I worked for Mrs. Wichman and then I planted some taro down in where the State lo'i is right now, down by the cave. But my pastime was fishing, so that's the reason why I learned it well. My dad was the best fisherman; he go throw net fishing. And of course we fish with old man Hanohano Pa; he was a good fisherman too. And of course I fish with my father-in-law Henry Tai Hook. I still do that now -- throw net, making net, everything, like most fishermen. The only net we had at the time and then we had to go pitch *kala* and then we had *nenu*, that's the only kind of net we had, nothing heavy duty. And the other kind of fish we just throw net on 'em like moi and all that. Bang-bang net is about 500 mesh across with floater and lash too like the time we using *aho*, and *aho* had 96 -- no more this kind rope now you know. That's how we use to rig the net with the *aho*. Twine, that cotton twine, you call them *aho*. We use to use the *hau* floater because you don't have to go buy. You only buy the *aho* and weave and of course the twine -- another *aho* to lash the net down to the length. We use to do everything for the bang-bang net; in fact we use to do everything for the throw net too. We use to sew our own net and we learned it very young. When I was 12, I started to make nets because we were interested in throwing net because my dad catch all the fish, so we learned that time. The other thing we use to catch too was the turtle; that was our meat. So what we use to do was catch the turtle and give every Hawaiian family over there a turtle, one each house. Even at that time the jobs were kind of scarce and the wages no good. Like the County use to pay \$30 a month. So my dad when kinda lay off from the County for a little while in the 1940s I think and worked for Dora Eisenberg and had better wages. At that time the wages Mrs. Eisenberg paid \$55 a month, which was good money. And then of course my dad use to ask her for car like that and then she use to go Garden Island Motors and buy the Model A and give to my dad. My dad would pay back slowly and all of a sudden she tell my dad just to keep the car and stop the payment. She just gave him the car. And we had several cars from Mrs. Eisenberg. My dad use to take care all the properties out here like we use to take care up to across the pond down by Limahuli, we use to take care all that. That was Eisenberg's. And then where Mrs. Wichman owns, they had house made for us, and we stayed there part of the time and where my sister lives, that's where our property was so we use to live there too. We lived there for many years, all my teen days.

My dad use to work *sailamoku* on the boat, you know, deck hand. They call it *sailamoku* at the time. He use to work for the *Wai'ale'ale*, they had I think 3 or 4 ships that ran between the islands to haul cows and rice and whatever. He use to work over there on that boat partly and then go back to the big island when the coffee season harvesting time to help his dad- his dad was a coffee farmer. See, what happened, my grandfather came here- I guess he had a family back in Japan, he came from Japan and married a Hawaiian woman over here. That's where my dad was born and then us guys. He had my dad and one sister; I think there was five of them. My grandma was full blood Hawaiian. My grandfather came from Fukuoka, Japan. My dad's name was Joe Mahi'ula Hashimoto. He came here because...well his grand uncle Keoni - that's what brought him over here. He [Keoni] came to this island when he was 80 years old in 1910, that's why he knew this island all over the place because after my grand uncle passed away, he lived with old man David

Pa. Old man David Pa...this is a complicated story. The old man was 17 years old, he married my grandma who was my grand uncle's wife that came from the big island, and my grand uncle married David Pa's sister, just like switching over. When my grand uncle passed away, he (my dad) lived with David Pa, because David Pa married my grand uncle's wife – my grand aunt. And then we stayed with the Pa family too because the connection was there because my grandfather married the old man's sister, who was Kaihilani. And all these people were born and raised in Kalalau, the last family to come out from Kalalau – the Pa family yeh. So when I was growing up Hanohano Pa's mom who was Wahinekouli, she was in her late 70s when I was in my teens. We got all acquainted with these people because my dad use to live there part of the time, live over there, live in Waimea, live in Hanapēpē, that's why he knew people that lived on this side of the island and in Waimea, Kekaha and Hanapēpē. Like the Akuna, the Malama, all those Hawaiian families. He lived over there. And my dad was very good in Hawaiian - fluent Hawaiian. I don't know why my dad didn't want us to learn the Hawaiian language. Even Japanese, that time they had Japanese school. But war time they went close the school because the Army took over all those places. I understand Hawaiian when people talk, but to converse, no. Now we kinda older and it's hard to learn than the young people. I know my granddaughter, five year old, she good in Hawaiian because she go to the immersion class. Now they get school for that. You just let em go because that's the only way they going learn the language.

I was young, my dad when he was around with people he always talk the language, you gotta talk it every day and that's what happened. Like they would talk funny kind stories that we no can hear or understand, that's the reason why maybe because they talk that kind. So that's what happened. After we grew older we kinda know what the hell was going on he would explain to us. Like he use to tell us...oh you know he use to listen to the music from Alohikeya, you know who that is? He was a composer, a cracker-jack composer who lived in Waimea, I think he came from the big island. He used to write songs about how he used to handle a woman. So when the song is sung, so beautiful but the meaning of the song is nasty! And my dad use to explain to us but we were older already. We were married when he use to do that. We use to go sing that song and he laugh because we don't know what the hell's going on. He gotta explain to us what the song was all about. That's how we knew.... My dad never go high school, he went grammar school, but actually it's learning with the people in this difference areas, that's how he learn that. My dad knew his Hawaiian, nobody touch him. Even the name places of this whole island, when you ask him, he tell you what the name of that place like how these activists and all that he tell em the name. Even the other side Waimea side, he going tell you because he lived all over this island, that's how he knows. Like from the old people, the Hawaiians. I was real stupid I never go sit down with my dad because at the time I had family, I gotta go work. I use to work for Julia Wichman during the day and at 5 o'clock go work hotel til 2 o'clock in the morning, bartender. I did that for what 35 years. And then quit 1994. steady go work. And then go work only Limahuli. But I did plenty things in my life.

I think they (mom and dad) met over here because my grandma had three families - grandma Martha had three families. One was my mom folks - my mom and her sister - and then they had another family, Saffery. She was for Leonard Saffery. And then she came here and she married Kimokeo Kanehe, so that's how my mom moved over here. And that's how I think my dad got involved. My grandma was Martha Ka'aiakamanu from Maui - the family still there. That was her maiden name. And then she has two sisters in their 80s and they still living in Maui, I think in Lahaina. And they look exactly like her, the smile everything, reactions. That's what my cousin told me because they went down there, they had one reunion so that's how they met these people. And we were thinking about it because last year we went down for my granddaughter's baby luau in Makawao, but we never even think about it because we got so involved but by the time we came home was too late already. So we didn't have any time to go run around the island. [With Saffery] they had two; I think one girl and one boy. My uncle's name was Jack; now I forget what my aunty's name was... ah Sarah - Jack and Sarah Saffery. Kimokeo Kanehe, that was her third family; she had three children with Kimokeo Kanehe.

I don't have that much education, but in my own way, I see all around the way these guys act and that's what made me try.... Where my sister's living in Hā'ena that's my house. I went build that house as my memorial for my dad...but you know what, my dad wanted me to get the property but I wish I didn't get it. My sister, in fact, when my mom died my sister never go put that probate in court, because we were asked to; myself, my brothers Joe, Jack and George who lives in the mainland, and we got two acres in Hā'ena – that's what she got. She tells my brother George 'that's my property, my property' - til today. And you know what happened, she never realize today computer eh? My daughter Dancit can go in too, go find out who own the property; my daughter Leilani own the property - only her name on there. My sister went change um.... I paid the inheritance tax since my dad. Our property value was 40,000.... That's why the Hawaiians sell all their property in Hā'ena because they couldn't handle the tax. Like you know the Chu family they own below Limahuli, Barlow Chu – retired, worked with me. They had to sell um, forced to sell. No can handle the tax. All over there. With that kind price behind over there, no way.

I get a little over 20 when I got married in 1954 I was 19. I got married young. 54 years we were married. We had one reunion, on our 50th anniversary we had one party, my girl went throw one party for us at the Raddison, and that one they went surprise us they went catch us really off guard!

###

**4.2.3 Clarence Medeiros, Jr.** My name is Clarence Medeiros Jr. of Kona, Haleki'i and Kanāuee, North Kona. I also reside in Honokua, South Kona. I went to school in Kona, from first grade to sixth grade at 'Alaē School, South Kona. Then I went to Ho'okena School, South Kona. When we -my dad and I- moved to O'ahu – he was working on O'ahu with some other cousins. We stayed in Kalihi, and I went to Lanakila School. We also stayed with my great grandmother over there. She was Mary Pacheco Costa Pimental, on my father's Portuguese side. She lived on Birch Street. Then we moved to Kalihi. Then we moved back to Kona, and I finished school at Ho'okena School until eighth grade. Then I went to Konawaenā High School. I joined the U.S. Army in 1969 until 1972. After that I went work but I also went back to school - masonry apprenticeship school in adult education classes at night and earned my journeyman certificate and worked as a journeyman mason as block setter, cement finisher, stone mason, and doing masonry skills such as layouts and estimates. I continued my college education at UH Hilo that included the requirements like English, math, and took up blueprint reading, structural engineering, Hawaiian language, Hawaiian history, ceramics; and I took some fun courses like golfing. I worked in the construction industry for a couple of years, and did some heavy equipment operator jobs too, because when I was in the military I went to engineering school and got a certificate from the military. I worked at the Kona Hospital in the engineering department and took care of all the electrical, nurse's call systems, etc. throughout the facility. I had to stop working because my injuries that I got in Vietnam was getting really bad and I get hard time move around to do my job because I would fall off the ladder when my legs would buckle and my injuries kept me in the hospital as a patient a week at a time. So I was asked to stop working and got disability income. I then stayed home and took care of my farms: macadamia nut, coffee, dry -land taro, a big banana operation, avocado, cattle, and horses, but coffee and macadamia nuts were the main money -maker for my farms; and I also grew produce for the house. I did that from the late 1970s all the way up until 2007 when I decided to let the pigs enjoy my farms because price for the macadamia nuts went down significantly and it was not worth the effort. We haven't harvested the nuts for almost a year now. The coffee is okay. I still plant the taro, and give the huli to my children and grandchildren to work, pass em on to the next generation to learn aboutem so they can continue.

So now we talking about Hā'ena. But since I'm talking about the taro, I wanted to say how I got involved with Hā'ena because Nellie, my wife, had a seminar on Kaua'i. She was there for three days, and during the day I was by myself and I had this rented car, so I went gallivanting. In preparing for the trip, I had to drive quite a ways to find this place where our relatives had property. In doing genealogy thirty years ago, somehow we get family over there by the name of Mokuohai. I did more research, looked through books and listened to stories from our elders that kinda pinpointed the family to Hā'ena. Then I got the book from State Preservation, Dorothy Barrere - she made this book that was an Ali'i Awards book about the *konohiki* that were awarded properties from the king. That name Mokuohai was in that book, the probate. This was all probates. It showed the genealogy; and then my genealogy was in this probate. It looks like since this probate was done, he had property on Kaua'i and it was in Hā'ena including three kuleana that were located across from the wet cave by the end of the road. Awarded was half of Honokoa Ahupua'a on the Nāpali Coast of Kaua'i.

So, during that trip I left the hotel and went on an adventure and came across this hill - ad for tourists located on top of the hill on the way to Hā'ena. So I went to inquire how or if I needed to make an appointment to go on the helicopter that was available, and how long it would take to go where I wanted to see; so the tour people said it would take about two hours, so I paid them and went. We flew along the coast, we flew around Hā'ena, Limahuli, and at that point I still didn't meet anybody yet; but I saw smoke by the wet cave area. We flew in a circle, looking down, seemed like people were opening up the land yeh, cleaning and burning rubbish and stuff. So, we made a couple of passes there and then we went along the coast, but while we were flying somebody was giving us the "birdie," maybe we were irritating them, tourists or what. So after I got off the helicopter and drove the car down and I seen people working there. So I parked the car, walked across, and talked to this guy who introduced himself as Carlos Andrade, Chipper Wichman, and his wife Hauoli. As we got talking it appeared that Hauoli was a relative of mine on my mother's side and she was related to the Leslie family etc. from Kona. They invited me and showed me what they were doing and they asked me what was my interest over there. I had my genealogy documents with me and the paperwork that talked about Mokuohai kuleana. They were really happy because they met me, a relative, who was interested. So they asked me if I wanted to come back and help them and join the organization, a nonprofit group. Since then I went back at least three times to help them with the lo'i, planting and clearing; but I haven't been back there for maybe six years or so, because I've been busy and had to take care of some health problems. I got to know Chipper and stayed at their place the second time we went.

The last time we went back Halau Hula O Maiki had a hula uniki there and we were invited to go because Nellie is with the halau, and they asked me if they could have a black pig because whoever they tried to get it from they couldn't come up with it. It had to be a black pig that was big for the occasion so they can eat the whole thing - as part of the uniki, the people had to eat everything, all of the pig, the whole thing. I went to my friend and he got the pig, it was about 80 lbs, and it was really down to the wire like they were gonna do it on Saturday, we got it on Friday and got em to Kaua'i. When we got there they had prepared the imu but it had rained so heavy that they had hard time getting the imu lighted. We had hard time making the water hot because everything was wet; but we got it done. The uniki went on and it was something that I was really impressed with - how they did their customary uniki. I was asked by Coline Aiu to sit with the kupuna on top where they had all the guests but I stayed down with Chipper them because I was talking with them about all of the work and stuff so anyway I felt too young to be sitting up there with the kupuna, and they respected my wish that I stay down and help with the work.

After the day I went on the helicopter and met with everybody, I still had two days left. So the next day I went to the real property tax office and met this guy named John Kruse who was working there. He made me all the maps that I needed, the areas that I was concerned about. Even Ni'ihau, he made some maps of over there. He gave me the tax map keys. I went to see the County guys the next day about any archaeological stuff down there, and they gave me this report and I was looking for the burial of Ka'aumoa - na Moa Niau, my great-grandmother who moved from Kona to O'ahu and then to Kaua'i under the name Moa. When I looked at the public notice

that they were looking for descendants of these people, I knew exactly who was there and who I was looking for, and that was the Moa family from South Kona - Kalahiki Ahupuaa, and I found my great-grandmother; she was buried over there. Alongside the Mokuohai family was family on my father's side; so I hit two birds with one stone and that fulfilled my search when I was looking for my mother's grandmother - my great-grandmother. So I found the link and made the connection. When I went to the census records I found some of our other family that moved from Kona and lived over there in Kapa'a and Waimea areas under the name Moa that came from Kona.

My great-grandmother was married to a Chinese; my great-grandfather was from China. Zen Sing. When I looked in the ship's manifest, I looked for Zen first - Man Sing that was his first name. But then my grandmother was born they did em just like the Hawaiian way, they drop the Zen and they used Man Sing. That's why her name was Annie Man Sing. Sometimes they would use Zen in the end, not all the time. The first name became the last name- same way in Hawaiian. The first name became the last name. A whole bunch of them came on the same ship, all cousins. I found all of the cousins that came the same time. Was good, because when you look back on the ship's manifest, they tell who the parents were and on the mother's side - Soong family. Sometimes it was Soong depends who wrote em yeh. Other times was Sun, but they were related to Sun Yat Sen.

The Mokuohai genealogy, the one that was awarded the kuleana in Hā'ena and part of Honokoa comes from here in Kona and also in Ka'u. They left Kona when Kamehameha's fleet went over to fight or take care of business with Umiumi; and he never came back here in fact he came back but he was awarded some lands and then had children over there [Kaua'i] - a different batch of children from the ones that were left here. That Mokuohai, his first cousin is Puhalahua that I descend from, who married Kanika. Mokuohai married to a La'a, and he had a batch of children that stayed in Ka'u. With another wife that was in the probate, they had a bunch of children that stayed in Kaua'i. Then he had another wife in Kona that would be the Ka'ahanui line from Kona and Ka'u, so there's a whole bunch of descendants of that Mokuohai. When I was on Kaua'i I met one of my cousins at the same time when I met John Cruz, I went to the OHA office and met one lady named Francine something. She was working at the OHA office in Kaua'i. I just went in there to ask her if anybody by the name of Mokuohai was registered or who come in to inquire of the genealogy to call me, and I gave my telephone number. So when I went back to the hotel waiting for Nellie to get off work so we can have dinner, my phone rang and it was Francine. She said you know had one lady came in here and said she was from the Mokuohai line just after you left that was registering at the office but her last name was Daniels, and she lived someplace in Kapa'a close to town. So she gave me the number, I called her and we met at her house, we had lunch and she had a nursery and was shipping all kinds of plants like ginger etc. to the mainland - really, really nice kind plants, good flowers. I helped her and gave her some of the information I had. She was going share some stuff with me of her line, and she told me that the Fernandez living in Kaua'i who was a state forest enforcement officer, the boss was from the Mokuohai line - a descendant from the William Mokuohai family that was living there, and his mother who was a daughter, married a Fernandez. There are other relatives but I never had a chance to meet any of them. She was gonna get back to me about stuff but she was in the Hawaiian Kingdom movement, and she asked me my opinion, and I think that might have turned her off when I answered her.

As far as the Mokuohai line, that was the only person that I met on Kaua'i. I still have to go find out about the Fernandez family and whatever other families - their names. The Mokuohai was the *konohiki* for that area, the kuleana. I think more at the Honokoa area along the coast. There's a big valley in that area. When I walked in quite a ways I seen some remnants - look like people planted coffee in there because I seen some coffee trees. That's some terrain for wet and steep. La'a was one of his wives. Another wife he had was Ka'ahanui, and that wife was from down in Napo'opo'o. And I also seen records of her with him. He had some other wives and had children from them. One of the wives was Kaikai. We come from his cousin. So if we go back to their parents, I descend or Puhalahua descend from Keli'iuwela or Keli'iuwelawela and Kuwahu; where Mokuohai descend from the brother of Keli'iuwela and the mother is 'Aukai; but his wife is just

La'a. [Mokuohai's father was] Kekoa and then the grandfather is 'Aikanaka. 'Aikanaka with Kama'i Keohokalole - that's where Kalākaua and Lili'uokalani them come from. But I come from 'Aukai, the second wife - that's where Keli'uwela and Kekoa come from. [Kekoa's grandfather was] 'Aikanaka. His second wife was 'Aukai yeh, sometimes known as Keli'i'aukai. I seen in different books, Keli'i'aukai, like at the Bishop Museum, it's Keli'i'aukai. In this probate, it's 'Aukai. Z. P. Kalok ʻŌukamaile's genealogy, it's Keli'aukai. But I saw on record where he had another wife - Kaiohūa or Kaiāha. And then they had one daughter named Liliha. Liliha, when they were doing the sandalwood trade 'Aikanaka was kind of involved in that; I'm sorry, would be 'Aikanaka's sister not daughter - Liliha. They had a fort someplace on O'ahu; they were bringing all the sandalwood down, and she was there. I think it was in Kamakau's book.

[ 'Aikanaka's parents were] Kepo'okalani and Keohohiwa. And Kepo'okalani descends from Kame'eiamoku and Kamakahekui. Kame'eiamoku is one of the royal twins; his twin brother is Kamanawa. But Kalākaua's father is Kapa'akea who married Keohokalole - he descends from Kame'eiamoku's brother; so they marry family down here yeh. [The twin's parents were] Keawepoepoe and Kanoena. That's where Alapa'i comes in yeh. Pi'ikoi. That's where all the Kawanānakoā descendents come in, from this Pi'ikoi line. David Kawanānakoā them, they all come from the Pi'ikoi line. Keawepoepoe is the common denominator coming down.... This is old stuff. But we were very fortunate that they had good lines and were easy to find. Once you find one everything, connect back to. That's why every time we get into some civil action kind stuff, especially with land titles, we most likely can get our native rights because of 1778 and when Kamehameha conquered all the islands, we can link ourselves back to almost every place where 'Aikanaka was, or Kepo'okalani, all the way back where they either fought or lived there or was in control of battles and stuff so we can pretty much be successful and in most of the cases in fact every one, we get our native rights, not just because of the third generation back but we can go back all the way to prove that in Makalawena or in Maheula or in Ka'u, each chief was in all of that area or buried over there or something. We are very fortunate we can get the proof with all this kind documents, archival records, we can connect to them. Most cases, hard to beat other people that have been on the land for a long time but they cannot beat our native rights, then we can use the old trails or practice some of the things that were done in the past yeh. [Mokuohai had a kid there also named Pu'uhalahua Mokuohai] he died, and then Pu'uhalahua named his child Mokuohai. That's the one I showed you the picture. You see this one here, Kauhewa, Mokuohai he get one sister and she was named Kauhewa. So both sides used each other's names so they no lose the name. So, when we name our grandchildren, we brought the names back, like Kapa'akea; my brother David, he carry Mokuohai; my grandson Lincoln, we named him Kawehe because of Kamae's father; and then my granddaughter we named her Analea, which is another version of Ana Keohokalole's first name; the young one with the curly hair, his name is Na'ea. Kanika, this one here, her father's name was Na'ea and he descends from Keaweheulu; so we named him Na'ea Keaweheulu.

One day, when my dad was still alive back in the early 1990s, we went and met with one of the Kawanānakoā grandsons, his name is David, and his brother was running for office- Quentin. He lives in Kona, he has an 11 acre coffee farm up in Holualoa - hard working guy. So we met and then we talked and shared, and we now know we're family; real humble guy, hard working. Eventually, I try meet as many people as I can and go meet the families, and then show em how and make the connection- find the missing part, and everything connect.

# # #

**4.2.4 Chipper Wichman** I'm Chipper Wichman and I was born on O'ahu (1957). Our family is from Kaua'i here; raised both on O'ahu and over here on Kaua'i because every summer we'd come and spend our summer with our grandmother who lived in Fā'ena. That's how I really got to appreciate and get to know some of the people over there. Around 1972/73, I came to live over here with my grandmother. Since 1976 I've lived here full time. My wife father's side, my grandmother is Juliet Rice Wichman, and her husband...well, my Tutu Man is and I were married in 1984 and we raised our kids in Hā'ena. I graduated from Roosevelt, then UH.

My father is Charlie Wichman, and my mother is Jean Wichman. My father was born here on Kaua'i and my mother, Oklahoma, I think; she came over here on the Lurline. I think my dad was working that time as Assistant Attorney General for the State, and he met her - my dad is an attorney. My grandparents on my -actually [my grandfather was] Holbrook Goodale. My grandmother [Juliet Rice] had two children from Holbrook Goodale -- Uncle Holby Goodale and my father. Then he died in a plane crash, and she married Frederick Wichman. And she had a third son, Uncle Bruce...he'd be my dad's half-brother. Then all of them - the two previous sons were adopted so they changed their names to Wichman, but Holby when he got older ...when he became an adult he changed his name back because...the Goodale line was going to die out.

To me it's [Hā'ena] a very special area. Very significant for the fact that...when you go back and look at how our *kupuna* looked at the world and their traditional life style, the way that they lived and their cosmological beliefs and relationship to the 'āina...it was all so very integrated. It was dependent upon their ability to have a personal relationship with the land and live a subsistent lifestyle to be able to have access. Much of that was factored throughout our *pa'e āina* when western style of land ownership and looking at the world came to be, starting with the Mahele and the creation of actual land ownership. The Mahele was really the beginning of the demise of the traditional Hawaiian way of life because of the factoring of that system.

**4.2.5 F. Bruce Wichman.** I am Frederick Bruce Wichman. As it turned out, I was born in Honolulu (1927) but the first seven years of my life were in Upper Wailua on this island. Then my father and mother moved away to Oregon, so I didn't get back here until 1945. And this has been more or less home ever since, I've always considered this home even though I've been all over the world. My interest in the Hawaiian stories and place names because as a child we had no electricity so the family always got together in the evenings and there were always stories told, especially up at Kokee or Kipu Kai. And it was just part and parcel of growing up with all of these stories. When I got back here, although when I got back in '45 I worked for the Garden Island newspaper for one summer under Charlie Fern, and he gave me a column to write on, 'Kaua'iana' it was called. So I began to put down certain things, and he would put me on to certain kind of feature article stuff ... like when the *aweoweo* came in by the thousands into Nawiliwili. It's always been of interest. When I got back here after I retired, I found that no one was using the Hawaiian place names; nobody knew the old Hawaiian stories, and so I started collecting both. So my 'Place Name' collection for the entire Hawaiian Islands is around 5,000 words now. I've got four books out with eighteen stories each, and I have two others already in manuscript.

I went to Menlo School in Menlo Park, California for junior high school and junior college. Got my AA degree out of that.... because we were shifting...I was put into boarding school in September of 1941...but of course with no chance to come home. So I just stayed in the school

campus through the summer...instead of just sitting around doing nothing, I took all the courses I could to keep busy, so by the time I was sixteen I had my AA degree. Then I got back to Honolulu before the war ended, finally got permission to come back. And then I went to the University of Hawai'i for one year, but got kicked out over whether I wanted to go to school or play bridge...couldn't do both! By that time I had no problem so I went to the University of Oregon and graduated from there. That was just when all the GI's were coming out...you could get on the waiting list but with no guarantee that's why I went to Oregon.

[My major] ended up being English Lit...it was easier to do. Perfect for what I'm doing now. Then the Korean War broke out....I had missed World War II by twenty days, and I volunteered and was in the first volunteer group in Hawai'i. Got down on to the pier to go to Korea and the officer came down and said, 'You, you, you...step forward...you're going back to Schofield.' The draft had just come in and they needed people who could man typewriters. And because I had a college degree, they figured I could type. I volunteered for Korea five times and ended up in Germany! But during that Germany experience I ended up being -- I was a Private First Class ...and because they had nobody else who had, they thought, any kind of qualifications they wanted to put through One -Star Generals and Colonels into 'public speaking', but they wanted them to be trained so they put me in charge of them. And you talk about a PFC -- telling a General what he was doing wrong and in public speaking! But that's when I really realized I enjoyed teaching. I could do it...I mean I didn't get court martialed by these guys! After I got out of the army, I took a year and Gladys Brandt had Kapa'a -- she gave me all but two days of the school year as a substitute teacher. So I taught everything from kindergarten through all of the highschool courses...so when I got to the university to get my life-time certificate I knew where I wanted to teach, which was the four, five, six -grade level. I was a pain in their neck because I already had practical experience and I was older than the other students in the class...and would tell the teachers that some of the theory that they were expounding was a bunch of whatever! Gladys never really forgave me for that year of teaching because I walked off with her daughter! But, I was a teacher and then we moved to Switzerland. It was our dream to be in Europe for a year, and we ended up staying eight. I did technical writing for a lot of small American engineer firms, which kept us there...happily. We raised our six kids there and then we came back to Massachusetts...finished my teaching career and came back...and now have started a whole new career. So that's basically the story of my life.

My dad is Frederick Warren Wichman. He was in the Legislative House in Honolulu from '31 to '33. He was part of the Massie Case that took place and he accompanied my grandfather, Charlie Rice, to Washington to try to persuade the powers that be that the Navy should not take over the islands. The Navy wanted to put Marshal Law on the Islands and run it. They almost got there but... I think that's one of the reasons why he wanted to leave. In his old time -- his father had come to Honolulu in the 1880s -- he answered an ad that King Kalākaua wanted an engraver and jeweler. My grandfather answered the ad and got the job! He was H. F. Wichman; he had a store on Fort Street at one time.

My mom was Juliet Rice. Her father was Charlie Rice, the senator ... from Kipu Ranch. Her grandfather was William Hyde Rice, and of course he is the one that wrote the book on Hawaiian legends....Bishop Museum Bulletin #63. It's called *Hawaiian Legends*, I believe. And he was fluent in Hawaiian, his father had come out as a teacher to the Wichman Mission in Oregon, but he and the Harris' were put up in the home of Mr. Hall, who had just set up the printing facilities in Oregon, and he persuaded these two couples not to go because the situation was so bad, so they stayed here. William Harrison Rice taught at what is now Punahou, the Royal School. Then he was the manager for the Lihue Plantation. And an even older branch is my grandmother, Grace King -- Grace King Rice, [my mother's mother]. Grace's grandmother had come from Mo'orea to here to Hanalei. A German ship came into the harbor, this was in the late 1830s, and the First Mate on board lay dying. The Captain had asked him what his last wish was, and he said he wanted to die on land. And so they dropped him off in Hanalei and she ended up taking care of him, nursed him back to health and they had six children! So part of the family has been here since 1830s. Her grandmother was Ann Mo'orea Henry, married Freidrich Wundenberg. And he is the

one who blasted out the Kalalau Trail. This was in the 1860s. He did not want to endanger any of the men that were working with him clearing this trail, so he himself set all 400 charges of dynamite that they blew up along the trail ...because he was the Superintendent of Roads for this district and for the Monarchy.

I had one wonderful time being a chauffeur...that was at the Constitutional Convention time when they were electing people for that. And I drove grandpa to all the different political rallies that there were... My grandfather was part of the militia in 1896. And her [my wife's] grandfather was put in prison for being part of the Hawaiian side of the attempt to put Lili'uokalani back on the throne. William Hyde Rice was a member of the Cabinet, I believe -- he was the Governor of Kaua'i. The family story says that when Lili'uokalani was deposed, before she abdicated, that he wrote her and asked her to come to Kaua'i and declare her 'kingdom' there. The center of her kingdom would be there. And evidently so did the Maui governor. Because she trusted the American word, she didn't...all she had to do was walk down the bloody steps...if she had gone and confronted those sixteen marines, they never would have fired on her. They wouldn't have dared. Or if she had gone down the back steps -- and taken a ship to either island, and then said, 'Here is my kingdom'....it would have been so different. There had been Lahaina, there had been Kailua, no reason why she couldn't have set up back in Lahaina, or our own Lihue.

When I grew up at Pihanakalani....do you know where the Hindu temple is now... That big house there...my father built it...that was my childhood home. My wife's grandfather was raised in Kaupo -- family name Kanuha...[Hana] -- that's like Ha'ena used to be. When my mother first moved out here when you got to the Powerhouse Road, after the haw hedges...then you came up over that Kaumaka Point and around, from there on ... narrowly, was just a track through the grass...sandy...double track...that's all there was. The nearest telephone was Mama Nakatsuke's store in Wainiha. As far as we were concerned that was the first electric line too. My mother got a phone call when John Hanohano would jump over and tell her, 'You have a phone call. Here it is. Call back.' But in those days you cranked the phone and the operator answered and you'd say that you were trying to get a hold of so-and-so, and they'd track them down, 'Not at home, but I think they went visiting somewhere.'

# # #

#### 4.2.6 Randy Wichman I was born at Wilcox Hospital (1957)

-- I was delivered by Dr. J. Kuhns. My father was a schoolteacher. We also lived in Hilo, as he taught school there. When I was six -years old he packed up the whole family and moved to Lausanne, Switzerland. From kindergarten to seventh grade I was in the Swiss private schools -- Swiss public and private schools. Coming back into the U.S., I went into a Naval prep school on the East Coast, Taber Academy, and put to sea when I was fourteen. Graduated at eighteen, came back home and then delivered yachts all over the world -- did the Atlantic, Pacific, and Indian 'till I was about twenty-one or twenty-two. Came ashore, now that I had all the experience I needed, but I wasn't rich enough to afford my own boat so I went to work with Grace Guslander at Coco Palms. Well, first I started at Hanalei Bay Resort...Hurricane Iwa knocked us out...right after Iwa I worked for Coco Palms as the Assistant Manager for Grace Guslander.

That was 1982 to '85. Then I moved into the museum. I was a curator for the Kaua'i Museum for four years or so. Then I opened up my own business, photography...the eight by ten glass plate work for various institutions and private collections. I accessioned private collections all over the State, and worked on the big public catalogs. In 1992 I was in a position to afford my own yacht. Purchased a sailing yacht, a fifty foot Swan from the East Coast, sailed her out to Hawai'i. And did five trips across the Equator, to Tahiti, Marquesas, Cook Islands, Tuamotus. Got married when I was forty -five, and have been ashore since. Numerous trips to Paris ...to Europe....as we go back and forth...numerous trips to the South Pacific...traveled extensively for thirty years or

more on my own...all over the world. I am the president of the Kaua'i Historical Society. I'm on the KHPRC, County of Kaua'i Historic Preservation Review Commission. I've chaired it several times over the years; I've been on it eight or nine years now. I think I've been Chair three times. I was a member of the Office of Hawaiian Affairs Historic Preservation Council. We dealt, at that particular time, with all the various issues that were going on at the time...repatriation, things like that.

My background is in this particular aspect, I grew up in a family that each generation made significant contributions to the history of Kaua'i. As my father has done all the place names and the legends, as my grandmother's done many of the botanicals and some of the pre-contact prayers. My great-grandfather made huge contributions, as well as William Hyde Rice, with the Kaua'i legends...and Harrison. So it's a multiple generational thing. Every meal -- three meals a day...it's the only thing that we talk about every day...all day. A lifetime of that...this is where we're at. And then I've been buried in the library several times. My grandmother had one of the finest Hawaiian collections. By eighteen I was already fluent in all of the material, and in many private journals that are in the family. Since then I've been through her library again and the Historical Society Library twice, which constitutes years...around three or four years solid when you add it all together...reading in the libraries. So I must be on my fourth time going through all the books.

Now Hā'ena, having been raised in Hā'ena...my parents were living...we owned the Ahupua'a of Limahuli and the adjoining five thousand acres to it. My ahupua'a is Hā'ena, my mountain is Pōhaku Kane and Makana. My chief is Lohi'au. I am currently on loan to the Wai'aleale Complex of Heiau, because as past president of -- I've worked on the *heiau* now for a good twenty years...have been chair or *po'o* of the *Na Ka Hui*.... I am currently the vice-president Nā Pali Coastal Hā'ena also; we've been doing the Nualolo Kai for twelve years...that particular one.

Hā'ena is the center of the Universe to me...especially Kē'ē - the very end of the world. We have a very unique responsibility...my grandmothers, both my grandmothers, Gladys Brandt and Juliet Rice had a love affair. Naturally being in my front yard this is the one place on Earth that I'm the most familiar with. The earliest stories that I knew were the Hā'ena stories. Over the years I've seen Taylor Camp come and go.

[Ohana]...Kanuha, Lawa'a, Kamakakuokalani, of course, and from the Kona side -- Kohala to Kona -- they were the first architects of Pu'u Honaunau over there. We can trace our ancestry back into the main charts, and even to a direct ancestor that actually started the Pu'u honua. They were the third banner carriers for Ku-ka-ilimoku during the time of Kamehameha, and that's why we happened to be on his side of the fight and naturally made it. They were generals under him. They fought, killed, and died for him. And in return Kamehameha gave our family extensive war prizes on all islands, except for Kaua'i. Our lands can be easily traced through us. My grandmother ended up with Ka'anapali. She sold it in the 1960s, but clearly Ka'anapali was a war prize for services. We ended up...we had Pelekunu; it was another war prize of our services to Kamehameha on Moloka'i. Our lands on O'ahu were also services from the battles there. My grandmother was Gladys Kamakakuokalani Ainoa Brandt. My grandfather was also part-Hawaiian from the Kapuna'ai and Naele from the west side of this island. So I have both moku old Hawai'i and old Kaua'i also in the line. Although I suspect that my particular line here on Kaua'i were occupation soldiers after the Hume Hume Rebellion. I'm just suspecting it, that they were occupation soldiers. My grandmother [Gladys Brandt], of course, was a matriarch -- as both my grandmothers were. I'm a matriarch male and real proud of it...our men are strong but our women are even better. So I was guided by many very potent and powerful women....I can take it! Don't stand close to the fire if you can't take the heat...and I always could. So Grandma Brandt...was my mother's mother. My mom is Loretta Kuuleialoha Brandt - 'Ainoa-Brandt. Nawa'a also Kanu'u - Nawa'a and 'Ainoa are -- we suspect was a name change by my great-grandfather after he was jailed for his role in the Overthrow. But I believe more the story that said he hated his father and that he wanted to break the *kapu* that came with the name, Kanuha, and that's why the name Ainoa is there because that's the lifting of the *kapu* - that it is free, so I suspect that more.

Yes, he was jailed and all that, but I think it's because his relationship with his father was...he needed to break the *kapu* or the stigma. The Provisional Government [jailed him] for his role; he was right there next to John Wise - they were really good friends. It's an old family related to John Wise side of it too. He was right there with Prince Kūhiō also.

On my father's side they arrived here on the ninth company of missionaries. They started Punahou School...1840s. By 1850 they were here on Kaua'i. That was the Rice's. So they were here by the 1840s. He started Lihū'e Plantation...started all the agricultural ditches...really revamped all the sugar production...hated it, got out, and got into purveying. So for the next four generations we did all the beef, the horses, the milk....for Kaua'i. My great-great-great-grandfather, William Harrison Rice, was the governor...the first governor after the massacre...after the wars....was Ka'hala'ia...and right after that was Ka'iki'o'ewa, after Ka'iki'o'ewa was Paul Kanoa...well, Ka'iki'o'ewa...his wife Keaweomahi took over just for a little bit then Paul Kanoa comes in and for a very short period there's another one...then William Harrison Rice is governor...then William Hyde Rice is governor...he takes it through the Overthrow...and then Charlie Rice...my great-grandfather was the senator....but each one of their brothers - William Harrison Rice's brothers, William Hyde Rice's brothers, and Charlie Rice's brothers, were the sheriffs and judges. Go figure that one. But I think the history books are real clear, they were fair. But you can make up your own mind on that aspect of it. The 'Wichman' comes in from H. F. Wichman who Kalākaua really admired, and brought him to Hawai'i. He was the one who did all the metals and all the jewelry, and all the things that you see in all the photographs that these Ali'i's are wearing. After the Overthrow they started the jewelry shop, H. F. Wichman, both in downtown....

I think the last part of it essentially is that I'm *po'olua*, child of two fathers, my second father is Thomas Hashimoto. I do belong to the Thomas Hashimoto School of Rock Wall Building. I also belong to the Thomas Hashimoto School of Fishing and Fishing Resource Managements. I belong to the Thomas Hashimoto School of Ethics and Hard Work. His training has helped me in my life and a great deal in all of my heiau work, and so I'm deeply appreciative to his training and nurturing my whole life. [Growing up, going to Hā'ena]...absolutely. All over, all the time, especially out to the *heiau* area, to the dry caves, to the wet caves also. I spent a great deal of time working in Limahuli. I was with Thomas Hashimoto learning how to fish, throw a net on these whole areas. I'd be there early morning, mid-day, afternoon, even at night I'd shine my spotlight over the reef just to see what the fish were doing. I very rarely fished on my own; I always carried net for Thomas Hashimoto. But I always kept an eye on it...as he trained me to watch the fish...but I always kept an eye and would report to him every time I saw the black cloud. For him he called it 'black spot'...but because of the *kauna* we needed to use in all our fishing activities, we had our own separate language. He had the names of all the different houses...for instance, the *moi* that was in front there watching through the net, he knew exactly the next house they would run to. And all the way up from Kē'ē at the end of the road, all the way up into Wainiha he knew all the houses of all the fishes there. He knows them.

A *kapu* is a *kapu* and to me there's no exception. I've been *kapu* to bananas for thirty years because it's Kanaloa's *kino lau*. Being a navigator, a deep ocean person, out of respect for Kanaloa I didn't eat any of his *kino lau* forms. It was important for me when I was eighteen years old to know what it was like to live under *kapu*. And after thirty years of it, I can tell you, it's not a big deal. It's very simple. No is no, there's no such thing as any exceptions so don't be tempted by anything. I'm sure I'm not under the real serious *kapu*'s that once existed prior to the lifting of the *kapu*. But it was important for me to understand - to have *kapu* in my life and to learn to live with it. I make no requirements on anyone else, this is just me.

##

#### 4.3.0 Land Resources and Use

Land resources and use change over time. Often evidence of these changes is documented in archival records. Occasionally cultural remains are evident on the landscape and/or beneath the surface. However oral histories can give personal glimpses of how the land was utilized over time and where the resources are or may be. Oral histories also provide confirmation of cultural practices. Based on archival documents and subsurface studies the pre-contact uses of the project lands were ceremonial, burials, habitation, marine subsistence and agriculture. Based on archival and ethnographic data the cultural and/or historic use of the land in the project area was agriculture, recreation, subsistence fishing, and hula activity.

##### 4.3.1 Hā'ena in Halele'a

[Hā'ena] in Halele'a, but when you look at it [on the map - 1901] it's in Nāpali really, yah you know, that's why they went put that like that because it's in Naāpali. But now just like they been move em around so now stay in Halele'a, - Hā'ena. See Hanalei is way down here. But you know what they did now, they been put Halele'a and Nāpali together now because nobody go represent this place, Nāpali, so we the ones stay take care of this too. This and this. Because me the moku rep for over here...for the fishery and for the moku too [like the *konohiki*] [TH].

Hā'ena is an ahupua'a. The boundaries are kind of unique. It's real interesting during the Mahele, they were arguing over where the boundary between Wainiha and Hā'ena actually fell. They ended up creating a point. It's actually ...there's a small *papa* kind called Haki (?). That is the eastern most boundary of Hā'ena, and from there it runs kind of an angle up towards Mānoa right behind where the Hashimoto's property is. And then from there it goes more inland up towards Mānoa. It includes upper Mānoa Valley and upper Limahuli Valley, and then it comes down by Hanakāpī'ai, it includes all of the Limahuli watershed and then it comes down by...there's a peak called Maunapuloo and from there it goes down by Hanakāpī'ai. So most of the first two miles of the Nāpali Trail are still within the Hā'ena ahupua'a [CW].

Figure 10. Valley Systems of Hā'ena (Pacific Worlds)

1901. Yeh, this is old map. It's not a new kind, - this is when was Territory yet. But you can get it in Honolulu this map, I think, because this came from Ilei [Beniamina]. Ilei went give me this map. She said "Uncle, you keep this one, this is an old map" and she like one of mine. But I say I don't think so I going give you mine. They wish they could do all their papers of the moku just like mine eh. Get all the names along the coastline. But no more people that know that - they all gone already [TH].

Because Halele'a goes way up to Namahana over here. Shee, Namahana way over here you know. I see em over here. It's past Kalihiwai, that's the boundary for Halele'a. But now stay mark different, the map now, the color [Crown Land = Yellow; Government Land = Green; Nāpali and Hā'ena were "green" or government lands] [TH].

The actual ahupua'a of Hā'ena was not formally partitioned until the partition process began in 1955, it was concluded in 1967. It wasn't until the conclusion of that that the land was really truly cut up and divided and distributed. It was really from that point on, 1967 that we began to see real change in Hā'ena. So change, in my mind, change really began after 1967 when people could buy and sell and develop property. The other thing that changed in 1967 with the completion of the Hā'ena Hui Partition was the fencing of the cows. The Hui allowed the cows to run unrestrained over the common land in the ahupua'a, once the partition was completed the cows had to be controlled or locked up. Most people didn't have large enough acreage to have cattle, so the cattle began to disappear [CW].

##### 4.3.2 Park Lands: Former Residents

What's really interesting was that *maka'ainana* were able to purchase that *ahupua'a* back - I think it was 1875 when they formed a Hui, Hui Kū'ū'ai'āina o Hā'ena. That purchase enabled the Hawaiians living in that area to continue their traditional lifestyle. And if you think about it, in 1875 there were still many *kupuna* alive who had been born prior to Contact [pre 1778]. There was still a lot of knowledge of the old ways. And being that Hā'ena was so rural, it was isolated, and being able to more or less recreate their traditional land stewardship model through the purchase of this and the ownership of it in undivided interest, it allowed Hā'ena to really move forward into the modern era in a much more traditional way [CW].

In the Hā'ena Hui [my family] originally purchased as they were doing the Hā'ena Hui because my family had been living already right there on the flats, on the side of Kē'ē Beach where the Morays are and others. But the family had been living there in Hā'ena for quite a bit, so it was just across the river, right across Mānoa Stream. So they were there when the Hā'ena Hui [formed] [RW].

The Provisional Government immediately after the Overthrow banned everyone from Kalalau and dumped them on the beach right here at the end of the road. And there they made their way in through Kaua'i, some stayed in Hā'ena; others moved on, others moved off island and went elsewhere. But the entire Nā Pali Coast essentially came in on the beach right here and then entered into the new society, if you want to call it that, from Kē'ē Beach [RW].

Photo 43. Kē'ē Beach at the end of the road.

So I was there as one of the original members of Hui Maka'ainana. And I was there with Carlos [Andrade], Chipper [Wichman], my father, and others...in the initial conceptualizing. I was there when the master plan originally, in the '90s, was being talked about. I was there when it was pulled off the shelf and put to bed. I'm aware of some of the recommendations in that particular plan. Photographically, as president of Kaua'i Historical Society we have quite a photographic data bank in our society. We have all the original Hā'ena Hui materials, so I'm familiar also with that particular aspect of it. But my expertise is more pre-contact. Let's say Chiefess Kekela on back [RW].

[From the Park stream all the way to Kēʻē Beach, before the tidal wave, was] nothing. The only house, you know the road going inside, was the old man Hailama. Only the old man Hailama use to live inside there, where \_\_\_ own now - that was the only house that I know of that was down in that area. Had that house and get the State house that was Montgomery house where the State get now. Get one house down but you no can see em from the road. From Kekuhi to Kalinakaui and below Kēʻē behind the point, then get come Kauila. But anyway, now gong back to this, it's some place in this area - the Montgomery house is on this side - you gotta drive past the stream and before you go down the hill get one road going down there on the other side of the river, I think this is it, because this is the parking lot. Yeh, this is the place, the clearing, that's where that house is. You kinda halfway down to the ocean. [ and] that's where that lady, that redhead lady she get her house, and I think this is past this place right here -- this bushes over here. But this belong to the haole, and this one over here. This over here I don't know who own this house over here, and then this is the Moore's, that's their house. And then this is the road, and then the black boy, the one went marry Kana's granddaughter, Birdy Birdy, that's his place right here, clearing right by the pear tree right around that bend, now he been clean em all , he went build one little house down there, but never clean when this map was made[TH].

Mahuiki was one of the families that you can trace all the way back to the formation of the Hui Kū'ā'āina. Their name...you see it in different variations...but I think originally it was Mahu and then it became Mahuiki [CW].

Well, there was Francis Brown who originally bought it. My grandmother before she passed away deeply regretted that she didn't buy up all of it...and she could have. She thought the people that would come into the area would recognize its cultural and sacred significance and not build. But she lived long enough to prove herself absolutely dead wrong on the subject. People moved into the area had no connection whatsoever, did whatever they wanted to as if it was some piece of property on the mainland somewhere with no history. She deeply regretted it [RW].

All I remember....by the time I was growing up over there Mr. Allerton owned that house and then he traded it to the State. I think that trade was right about the time the partition was complete, about 1967. I think before Mr. Allerton was E. E. Brown... Allerton's house burned down. It was like his tool house or something like that. And I think it's okay to leave that up there, I think it's not really that visible in terms of impacting the ancient cultural use. Back like twenty years ago we were working with the *halau* and stuff to try and figure out...sometimes they need a staging area and a place to get ready. We were looking at what was going to happen to the place where the Allerton house was after it burned down, so I think its important [CW].

They [Allerton cottages] were all there when we were growing up. The workmen house were all there...the workmen use to live there yeh [TH].

It was in the early 70s that I got to come and actually live out there in Hā'ena with my grandmother. Those were really amazing years because it was still very undeveloped, still rural. The hippies had caught on and they had found Taylor Camp, which came really out of the partition process and the State's desire to acquire that. Howard Taylor had that conflict with the State and so he opened his property up to the hippies. And so it was kind of an era of change, it wasn't only Hawaiians and locals over there now, you were getting hippies and you were getting surfers...it

Photos 44-45 Allerton Estate

was kind of the beginning of a wave of newcomers that were coming there. But it was a time where there was still a lot of, how would you say -- among the local people -- still really traditional. The families were so closely knit and inter-related...there was still that real sense of aloha and mahele...helping and sharing with each other...it was a wonderful period of time [CW]. Barlow's [Chu] property was right across from Limahuli. That's where he would come out and clean over there. That was their family's property until they sold it. You know who used to live with Barlow...and live down there, was Carlos Andrade [CW].

Most people, they don't call it "Taylor Camp" already. The whole lo'i restoration probably...to me we call it Kēʻē...but to me Kēʻē is more down here. The *lo'i* is not necessarily, like you said, there would have been a more specific name to that [CW].

This place right here right by the Taylor Camp was Kuakala and Kuahiwi but that name Kuakala was the one right near the shore that's why went put em like that and Pulimukeiki is a little deep water over here and then this is Laikohola because that's where old man Kalei Kelau went get lost and they go send men down there in 1946. That's where we use to go fish down there. But he went die in that tidal wave. And the only house down there had was old man Kelau's house, was down in this area here. That's the only house had down there...down inside this area, below the parking lot, because over here get taro patch. That's where the taro patches are right in this area, this is the meke. All of these places get iwi over here, all these places. Only the old man Kila and like the old man Kila's house, the old man use to live over here the old man Kalei and Kila right next to each other. You gotta look back -- to back here. Right here, that's where they use to live in the back here at Laikohola. You see had different people planting over there. But you see at the time when the people were planting there was undivided interest. So you go claim wherever you like, and then if you had shares to cover what you had, that's yours. Because they went choose taro patch and house lot eh. That's how they did it. That's why some of the properties where they owned like for example like the old man Kila, what he did he took property right next on the side of us and that property use to be my grand uncle's property, use to be five acres but because my grandma went go marry him he gained that half because my grandma died young, so he went get the property was 2.5 acres too. So what he did , he went go take acre and half down the lo'i and one acre where the house was to make up his share. That's what happened. Was right inside here. Below where our taro patch area is right now. Inside here, was close to the kind he was planting all inside this area here right below the parking lot. All inside here, where all the lo'i use to be him, the Maka the Kelau families and that's about it and us, but we were planting on rice land at the time. Adjacent to us was Kinney [TH].

The Kinneys owned property out there [Hā'ena] too. I think they come from Kalalau too. That's why they been own land over there and they get *kuleana* over there. The one house went buy in the back of us Limahuli Garden, that's from Kinney. That's Kinney kuleana. So they own that place because get royal deed, the *kuleana*. So they been own that place. And you know where that place stay? Right inside here. Up across the river. Up inside here. Gordon Haas and Roberta Haas own that place. You know that place windy, that place stay right in the wind channel [TH].

Some of the old families that I know are still hanging on to *kuleana*'s right there - the Wann family, Presley Wann, Lei - the Wann family - W-a-n-n. And recently having gone over the *kuleana* claims and then re-familiarizing myself with the names - some of these families are still running around too, and I would imagine, if give a chance, they would take certain *kuleana* in this too. And the other one is Keahi that I know o, that's also in there [RW].

#### 4.3.3 Park Lands: Taro Agriculture

I planted all on old man Kila's place. I planted all over here in 1959, after the 1957 tidal wave until 1966. I pulled my last crop from here in 1966 because the State like buy em because of the hippies. That's why all the landowners been sell to the State, that's why the State been own these. But you know what? That was fine. The State went go buy em with federal funds. You would think that's federal place not State. By that time Kila wasn't here already. Too old already, he

was on O'ahu with his daughter. By that time maybe the old man went die. Because I went to Honolulu go see the old man for the land so I can plant taro in 1959. No I seen him in 1958, 1959 I been go plant over there because I went clean all the sand in the taro patch from the tidal wave before I went plant that place[TH].

Photos 46 and 47. Restored *lo'i kalo* in Hā'ena State Park

[We plant] what the ground can handle. Not every variety. The variety we had was *nukea*. That's the dark green one. And then we had *peali'i*, *lehua*, *piko*, get the black and the green — *hapu'u*. *Hapu'u* get the black and the green kind, dark stem on the bottom. Either *nukea* or — that's the best [for poi]. White, when you bag the poi just like sour poi, but *ono* that poi when *poha*. *Ono* that poi! That's what I like, in fact, we all like that. We go pound the poi it still white just like sour poi, but *ono* this poi when *poha*. But now they get more *lehua* now eh. *The hapu'u* is good, the *hapu'u* grow like the Maui taro because he grow big eh. Because before, you can tell the *hapu'u* because he going grow higher than any other taro. The *hapu'u*, the black one or the green one. That's the way it is, just like the Tahitian kind now. They grow like that and the *huli* big like this, big just like one coconut. Like when I went plant the Maui one here in Hā'ena, that buggah was just like one coconut. Nine taro for one bag. Big, enormous — the taro was big like this! The first time I went plant that, when I went to throw fertilizer, I had to go underneath the leaf to throw the fertilizer because was big like this. The first time I went plant the Maui one down in Hā'ena in 1969...that's when the *huli* came around eh. I had some for my friends, that's how we went plant. [Nukea] that's what I like. The other *ono* poi, well, all the poi is *ono*. You see, like the *hapu'u* and the *piko*, the poi is gray, it's not white, it's gray. And then the *lehua*, the poi is red. And then you get the *peali'i* is maroon the poi, on the dull side the color — maroon, just like the purple potato, something like that, the taro. So when you going make em and the buggah come *poha* he going come maroon, like the *lehua*, little different. That's the pure, not all mix up kind [TH].

Well, when we were growing up it was being actively farmed. Fred Fuji was growing *kalo* down there. Uncle Tom was growing *kalo* down there, Uncle Jack, his brother. There may have been a couple of others, but they're the ones that I remember [CW].

[For leaves] any one. But you see, the Maui is the best because no itchy. The one real itchy is the red *lehua* one, but nobody get today. They get all the Maui. So all the other taro even the Tahitian, it's good the leaf and the stalk. No itchy. But the *lehua* you gotta cook em good, you gotta cook em overdone, and still you going feel that little bite. But before the people eat em. Depends what we got. But then of course we get that other one, what they call that, the one that grow in the valleys like that, sweet one, you get that because the taro small like that eh, and the *huli* and the leaf, but sweet that one. I forget what the name that was. And everywhere we get spring, river, or ditch, that thing grow. Like down above I could see em from the ocean, growing in the stream. Because it's kinda high on top where get the house, I forget the place, in fact before is it Hanako? Or right after Hanako? Get that place, you can see on top eh. People use to live in that valley, still get that taro on the side of the river. In fact Kalalau, only place get. You can go take the whole stalk and eat em[TH].

Like up here get all kind, even some from the South Pacific. In Palau, they eat taro. They don't know what ulu is because we get one student come from Palau, they eat taro and fish. That's what they eat down there, that's their staple. Not like the Samoan, the Samoan's staple is ulu eh. But the south Pacific people, theirs is taro. We get taro over here that come from Palau. They no like em for poi, I don't know something's wrong with it. The Palauans no like that, but for go eat like that regular, it's good [TH].

[Poi Mill], that was old man Kina, he had that thing over there. The two places that had that was there and Rice. You know where the pasture is, right across the pasture get that gate over there? Right inside there, in fact the house get one houseright there with one white fence on the roadside, use to be right in there. Long house, one long roof house, but only get one two-cycle engine to grind the poi. And Kina had the same thing. Only few people owned that kind machine and of course old man Alohikea had one machine. Sanborn had one in Hanalei, that's the only places that I know had the machine, the kind mounted on a regular basis, they grind. Although my grandfather had, he went go make with the model A, the tire. Start the motor and put the belt on the tire and turn the grinder, that's what he had with the model A. The Kalaaua's had the same thing, with the model A. Some had em on the drive shaft, Some had em on the tire with the belt. I seen that that's why I can talk about it eh. When I was planting taro down there, the thing was in the storage. Was inside the place where I store all my tools. And everything was all intact eh. After the State went buy em, everything went, and we had two hurricanes so everything went [TH].

We have the connection of Limahuli Valley itself which is where a lot of the food was grown that cared for the community that lived out here full time. So I believe you had some of these taro patches right here along the edge of the Limahuli Stream, but also Limahuli Valley was really the entire bread basket that fed the religious center at the end of the road [RW].

At the end of the road here used to be functioning taro patches. And they have started that *lo'i*. Of course the State Parks should never have allowed them to go out of use at the beginning anyway. And there's no reason why that can't be put back and turn it into a sort of a place where people can come and see certain of the stuff growing. Would have to replant the *hala* trees....but I don't see why you can't allow some place where people can come in and do *hala* weaving....fish netting...fish hook making. There's a lot of stuff that can continue the culture; that would go along with the eventual plans for Kanehameha Schools for Lūmahāna....because their idea is to turn it back into a functional *ahupua'a*....but of course that's going to take years of planning and lots of money [FBW].

Photo 48. Broad-leaf *hala* at Kē'ē Beach

When we went in originally with Hui Maka'ainana o Makana [1998 or 1999], was there when they founded it, was there when they first went in and they opened up the *lo'i*, worked it and got at least three to four of the *lo'i* up and planted and operating. I was there with Todd Musashimoto -- he did all the inital clearing of the land and subsequent planting .... I think one can easily vision the areas that Hui Maka'ainana o Makana can expand to taro patches. I think we can begin to envision what the experience of our visitors is going to be when they arrive there. That immediate connection into the taro patches to begin with, I think is going to be important. Having a trail that actually loops around the ocean front and actually makes a full circle from the internal parking lot, which we know is going to have to be expanded and is not enough [RW].

They were talking about that way before that guy you know that guy that went go draw the plan and then they went run away go mainland. Run away go home -- that's when we started that project. That's when we go open all that taro patch for the archaeologist go inside there go map

em. They had all this drawn up already, but like I told Chipper, you guys go do the paperwork, we go do the tackling part, which I did go clean up all that place [TH].

#### 4.3.4 Park Lands: Other Vegetation

All these guys who plant *hau*, the *hau* do damage. Where I was planting down Kē'ē no had *hau* before you know. That hippies went bring over there go make the kind shed that's how that thing went grow all inside there; before no more *hau* down there - only had palm trees and *kamani*. After 30 years I been go back inside there, I went kinda lose my bearings eh because everything is all high. That's why I told them to go back over there go plant down there, they was going open the one right by that house where I was telling you, Montgomery, the State ho use. They was going cut over there, the trees like this big! How you going do that in the taro patch? The ones down there at least not big like that - stay all on the *kuleana*. On top the bank, not inside, had some inside - I been get em with the backhoe. The excavator, I been dig em all out. Although we not supposed to take machines inside there, but we go with machines inside there anyway, I did all that thing up. That's why now stay clean eh that place. I take em all out [TH].

Photo 49. Hau grows in several places

You know, it just was always...I guess at that time it just seemed so...it was a lot less overrun with alien vegetation; it was a lot more open.... The coconut trees were all there but a lot of the octopus tree, and all of that stuff that's covering it all now, none of that was there. There were vines and stuff, but you could see the rock walls, you could see the area. None of those *kamani* trees were covering the inside side of the park, right behind the lo'i and all of that. The ironwood trees are still there, were there originally. But it was an area that was never crowded [CW].

Photo 50. Coconut trees in HSP

#### 4.3.5 Park Lands: Activity

Well, when we were growing up it was really different...it was still very rural, very little tourism. Maybe once a day the "stretch"...we call it the "stretch", I don't know what you call it now. Actually, it looked like the long limo kind of thing. That was the tourist car, maybe once a day the thing would come down there. The cows ran wild in those days ....they fenced in the people... now the people run wild and they fenced in the cows. I think it was better before. It was just an amazing place to get to be. It was so beautiful [CW].

The Kauluo pā'oa (heiau) and Keahualaka, you could see it from the beach. You could go down there and go to the beach... it was just a great resource [CW].

Photo 51. Can no longer see heiau from Kē'ē

#### 4.3.6 Park Lands: Kalalau – Hanakāpī'ai Trail

[Freidrich Wundenberg, Grace Rice's grandfather] is the one who blasted out the Kalalau Trail. This was in the 1860s. He did not want to endanger any of the men that were working with him clearing this trail, so he himself set all 400 charges of dynamite that they blew up along the trail... because he was the Superintendent of Roads for this district and for the Monarchy. Because he

also did a lot plant experiments to see wh at plants would grow out here, h e's the one that started the oranges and the coffee. So along Hanakoa and Hanakāpī'ai [trail] you'll still see coffee trees. But the blight hit the orange s and blight hit the coffee. They wanted to be able to bring out the produce out of Kalalau. I believe they thought it was easier to come out this way -- one of the reasons they ca me this way was because Nu 'alolo was almost impossible to get in and out of except by sea. So that you had Kalalau, Hanakoa, Hanakāpī'ai, all of which were heavy with oranges and coffee. So his instructions were to build a trail that was wide enough for a fully loaded *burro* to move comfortably, which makes good sense [FBW].

Photos 52 - 54. Trail signs in Hā'ena State Park.

#### 4.3.7 Park Lands: Taylor Camp

Elizabeth Taylor's brother brought this piece of property that's right there on the bay, and the State condemned this particular end of the road in the early sixties or so - scattered all the owners and the taro farmers to the four winds, locked it down. This guy Taylor, in anger allowed these -- I don't want to stereotype or anything like that, but allowed a commune to begin to form that went unchecked for a long time. I remember the hepatitis epidemics one after another, almost non-stop epidemic level hepatitis with all the various strains, the significant trashing of everything and the whole subculture that happened there... Taylor Camp occupied all of this [looking at map] - this was all Taylor Camp. Well, actually it goes further out; it's actually all of this... Taylor Camp just refers to that particular time in history when it was overrun by the commune [RW].

Photo 55. Kalalau-Hanakāpī'ai Trail

#### 4.3.7 Park Lands: The Future (Master Plan)

We know the helicopter pad's got to go in there; we know that certain portions of this is going to have to be data recovered as you might be taking out a couple *lo'i* in order to actually put in the basic infrastructures that you need right there. RW

A lot of this stuff in here - the vegetation is *kamani* - there's a botany aspect to it too, so that's a separate 'House' too. There's a whole *lā'au lapa'au* aspect that could be done here too, which actually creates a whole other separate 'House of Botany' - again, a completely different discipline, and under different goals and objectives, but still important to the big picture. RW

Prior to the commune it was the Taro Mill - the footprint is still there so, I think, interpretive-wise that's still pretty cool. I think even to allow the Hui Maka'āinana to have the potential, if they should want to, to grind the taro in the original footprint, or close to it if you wanted to keep it. We can let SHPD decide on that one, whether we can use the original platform or build one right next to it. But the taro production and the taro mill, they are capabilities - could be there if they needed it - I know it's a long range plan but this is what it's all about. It's long range [RW]

###

#### 4.4.0 Water Resources and Use

The Hawaiian word for fresh water is *wai*; the Hawaiian word for wealth is *wai wai*. This is because of the value the ancient Hawaiians placed on fresh water. For taro farmers water was a crucial resource and a lot of effort was employed and strategies used in order to get it to the *lo'i*. Fresh water was also crucial in the lifecycle of stream inhabitants such as the *o'opu* and *ōpae*, as well as some of the marine life that depended on the benefits of *muliwai* or brackish water areas.

##### 4.4.1 Fishponds and Fishpond Fauna

The big *meke* was over there and had plenty water inside down there by Kē'ā. That's the only local ones down there, that one. And then of course up the one below the water tank, the one past the Wichman's...going down Kē'ā. All inside there, I don't know if had *meke* inside there or what because by the time we been go had all grass inside the re - *honohono* and *pukamole* and all that. I don't know if had taro patch inside there because we never go walk all inside there because it was always like that - like now get the Jobs Tears - more worse [TH].

We use to get *o'opu*, *akupa*, and I think crayfish; that's all I went see in there [fishponds], I don't know if had mullet. And of course had bull frog. The crayfish had plenty down there. We use to eat the crayfish, catch em, rinse em out in the 5 gal. water and *pau* we fry em in shoyu, even the sand crab we do that too, fry em and eat em, and that time was *ono* because get big meat right inside the leg eh just like how the crab you know [TH].

These can also end up being working fishponds too. And so that could be another aspect under the fisheries in not only managing the *kai* fisheries but the *wai* fisheries also. So those are there as far as expansion capabilities. It would be nice to have it as a larger master plan ...and step by step work up to it [RW].

Photo 56. Part of former fishpond and marshlands

##### 4.4.2 'Auwai

There were two main *'auwai* that came off of Limahuli Stream and this one here came down, this was the primary one [CW].

It was after the partition - I think they were bulldozing that when they were trying to clean up the Taylor Camp scene over there. So they've totally destroyed the *'auwai* system. And when they cut the water off to the *'auwai* system then the *lo'i* became useless. It became overgrown with all the trees. Then when we went in to try and clean it, to map it with Alan Carpenter and Mo Major - it was a huge job just trying to get it clean enough that we could actually go in there and do mapping. So what you see today is the result of a lot of work. A lot of years and years of work just to get the *lo'i* exposed - we've had to run a pipe down there to get the water back because the *'auwai* system was destroyed [CW].

The water is going to be coming from Limahuli Stream. Right now, I know, it's tapped up above the road. In Limahuli it actually comes down through the *'auwai*, crosses underneath the culvert, and reenters into the *'auwai* that starts to feed the *lo'i* that are actually down there. That water has been flowing for awhile now. We may want to take another look at the water supply Hui Maka'āinana expanding their footprint. Right now the last time I saw it there were four big *lo'i*, however I know that Thomas Hashimoto had two or three other *lo'i* in the areas ...and I know he wanted to open up too. So I think in visioning a larger master plan for the actual footprint that Hui Maka'āinana can expand their *lo'i*, with the foot-trails that are coming through there ... that we keep it pretty safe ... the terrain itself is not necessarily really difficult. Although slightly undulating, the view plains through here are absolutely stunning [RW].

Photo 57 Modern 'auwai system.

##### 4.4.3 Hā'ena Watershed and Water Sources

Limahuli is the primary watershed, the primary watershed or valley within the ahupua'a. Mānoa does have a perennial stream through most of the upper Mānoa Valley, but there are times when it dries up by the time it reaches down by the dry cave [CW].

Before times everybody would just drink the water out of Limahuli Stream ... our house...our water comes from an ancient spring called "Kawaialoha". That spring has provided our homes with water since before my grandmother moved out there. The guy who had the property before her was Philip Palama, and before Palama was Walter McBride. And Walter McBride had put in a system that took the water from that spring and brought it by pipe down to the house.... I know that that place where our home was, was supposedly *kapu* that was a *kapu* area. In ancient times before he put that pipe in from Kawaialoha, it was supplied by a spring called Waikapū. You've got to ask Uncle Bruce about that, he's got all the scoop on that [CW].

Photos 58 and 59. Limahuli and Mānoa Streams

#### 4.4.4 Limahuli Fauna

We had a Filipino caretaker there for awhile. He must have been only four and a half feet tall...we would fish and come in to Limahuli and then deep fry them ('o'opu) in the woks over a fifty-five gallon drum that was cut out for the fire that the wok sat on. This went on for years. These are some of my happiest moments [RW].

#### 4.4.5 Hā'ena Floods

Flooding...I've seen this end of the road in the most vicious storms you can imagine. I know on the higher side the way the water comes you're on the safer side - the lower side, no. Of course on the lower parts flooding is a problem in the heavy rains [RW].

#### 4.5.0 Marine Resources and Use

The sea is a great resource for people with access to its bounty and Hā'ena was and is an exceptional marine resource according to the ethnographic consultants. However, it is a fragile resource sometimes abused by visitors.

Photos 60-62. Kā'ē Reef sign; Kā'ē Reef trespassers; Kā'ē Beach

#### 4.5.1 Fishing Lifestyle

Everybody most time they stay home sleep, not us we fish night and day because night time is a different way of fishing. Like if we work the whole day, evening time we go fish, catch fish for the family. You like catch fish you go down the beach one time you wack em out in one pop, you take em home, share with all the people, take enough for us eat. We can do that every day because there was lotta fish around the place [TH].

[People say] "What uncle, you no go surf?" If I go do that, my dad would tell me "Now what? Go eat the board." You know what I mean? Everytime like that. I hear the people always say, always tell me, *hana ka lima ai ka waha*. If you no work you no eat, if you lazy you no going get food. You gotta work with your hands and make something. That's what I hear all the time. If you no do nothing they going tell you, *ahmoloa* that boy, he lazy, we hear all that [TH].

Turtle, fish, but we no catch plenty, enough only, because we can always catch fresh kind. We know where the fish stay, we can go take our net and one blast we coming home with one net fish. That's how it use to be with my life when I was young. That's what made me interested in all the areas where I go fish [TH].

#### 4.5.2 Fishing Grounds

We use to fish from Hanalei to there [Kalalau]. But you know, before was little bit different too because everybody we knew who the *konohiki* was for that area eh. Like in Waimea, my grandfather near the road, then you had Chandler, then you had Tai Hook, and then you had Haumea, all fishermen in that area. Then Hā'ena was La'a, Mahuiki, my dad, and Hanohano. Before everybody respect each other so they no full around that kind. Like Hanalei was Goo - Goo and Dias. Then down in Kalihiwai was the old man Naka, nobody go fool around down there because they respect; unless they ask for help. Waimea had old man Kimokeo Kanehe, Chandler, Haumea, Tai Hook. All them were fishing right in that area by the beach. They had all Apana right there, coastline. They had their land there, they own the land, so they can fish right all through there [TH].

All the stuff that I show you, the maps that I have was originals from my dad. And he knew the place. Like today I go tell em the people who go fish inside there, they don't know. I can tell em over and over they no can remember. Like how I remember all that names. There may be people I went miss, I know that, I use to know the names, but I no go over there often so I forget. Lucky I remember that much because my brothers don't know that much too. Me the one went fish around with my dad, because my brothers went go in the service by that time, 1950 they went go away [TH].

#### 4.5.3 Fishing Methods

Hanalei we use to use *ku* net to *ku* the *'āpelu*, the *ahi* - *ahi* use to come we surround the *ahi* and catch em [TH].

When I had my family and I use the fish I go catch and sell em for subsistence to help me with money. At that time I use to sell the fish. And my dad did that when we were young too, selling the fish to the *Pake* - the *moi*, *āhole*, mullet - that's what the *Pake* like eat eh. That's how I learned to go catch fish. And we knew the grounds. That's how we learned everything that had to do with fishing [TH].

Photo 63. Uncle Tom's throw nets

That's why they don't realize how important we are passing down the message for the younger people. Sometimes like the old times, people don't wanna do that because people sell the information and make money out of it. That's where the wrong is. That's why the old people, they ask them, ah no, no, no, no, because they think like that. For me, I don't care because I'm not greedy for money. That's the reason why I share my mana'o with everybody, and I'll be sharing with Kepa Maly. Because of him that's the reason why I came up with everything, all the names, place names. Yah, I gave him all what I went remember and only very few I went miss because that's not my place for go, only those places where I went go fish where all the *moi*, *āhole*, where I go all the time. That's where I go back and back and back, and my dad use to say you go up there get big pile *moi*. I know where to go, I go straight over there go look [TH].

He [Uncle Tom Hashimoto] was mainly a throw net fisherman. He'd throw his own nets [CW].

I prefer to carry the second net anyways - I'm a team player - like to just follow Thomas around - carry the net. Whenever he threw his first net, I'd gather it up. If I had to go over the edge, I went over the edge. But I'd gather it up, drag it back to the beach, unloaded it and then drag his net back hopefully in time before he threw the second one. But I would go back and forth. I got to know the reef really good. As any fisherman knows, there are some taxes you have to pay. The spines of the *holi holi* hurt [RW].

Thomas is not a pole fisherman. We would surround the *'ō'io* when it would come into the bay. There were times when we would catch at least over a thousand pounds, and we shared with

everyone - everyone between Hā'ena and Wainiha - all the old families. That's because different families had different parts that you needed. Thomas had the deep nets and the boats. But John - John Haumea, for example, had the bag net that we needed. Once the fish were surrounded we needed to corral them up to a smaller net and then drag them in. But I know John had to have that....John-John Haumea who used to live right there at the Wainiha Bridge [RW].

Thomas had eight foot, twelve foot, twenty foot, twenty-four feet deep by a hundred yards long or more as you can piece these nets together. Because of the way we worked in Hā'ena our property has stunning views of the ocean, and it was a constant thing that we lift our heads up and scan the ocean - always. And when we saw the black spot, or the cloud, the work would stop. Then I remember him telling us stories that while they were working they would set the fishing lines out and tie them to one of those tin garbage cans, and when the *ulua* bit the garbage cans would be bouncing down the beach warning everybody there was a hookup. So all work stopped. Once the garbage can hit the water, the water stopped it and then they were able to retrieve it, and then pull the *ulua*'s in. But that was their way of fishing while they working. For us we weren't so restricted as such, so we had a chance to always check it [RW].

He [John] had the bag net that Thomas didn't have. Once the fish is surrounded we needed a smaller net to actually pull the purse strings on the bottom of it, and then that was the net that we actually dragged ashore - dragged closer in and actually up onto the beach. But all the times we ever did it, he never sold one of the fish. It was all given out to the different families that helped in pulling the nets in...it was a classic *hukilau* kind of thing. Absolutely. In Hā'ena - even in my day - which is the seventies and eighties when we were doing all of this [RW].

#### 4.5.4 Fish Catches

In 1966 before I went in the service we caught something like 96*ahi*, 100 lb fish. You know what the price? 19 cents! We sold 'em to Kip Mulley in Waimea, and we use a big dump truck to haul all that fish. We sold 60 and gave the rest away. Two guys one fish. Nobody gave fish like that away. They cut em all up. With us two guys one fish. 100 lb fish we give em. Go cut your own fish. That's what we did. And that was traditional because my dad he always tell us when you guys get one good catch, people come there, share. I still do that til today[TF].

From Lumahai to Hā'ena I use to catch all the moi down there. Big school, big like this house, you throw one net on top. For years I did that til today. Only me the one go catch the moi because I know the grounds, if he run away from me I go look for em because I know where he go run. I go get em. But lately I not doing it because I like replenish the fish [TH].

One time in 1970s we went go catch *kala*, I look inside I see the color - green inside there - so we make that kind net like I tell you, 500 mesh across, so we went in there, myself, my kid brother, Richard's two brothers, we went go inside there, shucks we had 92 *kala* in that *kuuna*. So I go home and ask my dad, "Daddy you guys ever catch plenty *kala* in one time?" He tell me yeh, Muliwai we caught 110, but look out, this is way after now, that was back in the 1920s! But us in the 1970s we was doing that we was catching!! And I use to go catch *kala* myself, I go with my small dingy catch 60-70 *kala* myself, and the biggest job for me was to go put em in my car eh. I gotta haul em up and put em in my car. And go sell em. That time I use to use that for subsistence but I use to go sell em dollar one *kala*, I made some money for my family! That's how I use to clothe my family, feed my family, plus my wages. I never stopped doing nothing, that's why I dunno how to surf like people like that [TH].

Most time I was going there for the moi and all the places I went name that's what made me learn that because my dad would go in the area and say, hey, going down there get big pile moi over there. I go straight over there. I go over there I look the big pile inside the wave already from far I look already. I go there and wrap em. Like this year, for all the years, that's the most moi I went catch - this year. I been catch maybe 600-700 lb this year, throw net. But not the kind for the kill

kind, its just accident I run into em I catch em. But not sell though - give all my friends, my kids. They like the fish [TH].

Over here we use to catch, 18 lb *ō'io* - big like this! Just like baby shark. In fact the one I caught this year was 10 lb - not too many, but mostly I would say maybe about 10 -12 lb because all this kind size eh. I had few big ones. And I had some smooth side ones like that, that's the kind I like to dry - we been dry some [TH].

There was always so much fish there in those days. The amount of fish in Hā'ena when we were growing up was so much more than there is today. Really, it's pretty amazing. I used to go diving and see the giant schools of moi swimming around ...big kind moi! Like as wide as this table...three feet. And the *kala* - every time before there's party, people go bang, bang and the *kauna* in those sand channels between *na papa* ...and oh, the *kala*! That was always good fun...everybody went as one gang and go bang, bang at night in there. Now you hardly see *kala* like that, no more *moi* like that...big ones already.... Those were the main ones. When we were growing up I used to like to whip too - go catch *papio*. Uncle Tom - we were always spoiled because Uncle Tom was the base fisherman and he would always - we hardly even go fish - he just bring the fish for us or we go bag-boy - go carry his bag for him [CW].

Now I'm *kapu* to *moi*, I'm now *kapu* to all baby fish...because the supply of *moi* is running out. I've personally *kapu*'ed myself on that [RW].

#### 4.5.5 Cooking, Preparing Fish, Etc.

Well before, most of the time we use to *pulehu* [*kala*], and make soup, cook em with shoyu and oil. It's *ono* that way. Of course they make soup only with water and salt. That time we real Hawaiian, and we use to eat all that because we had that at the time, we eat with the poi [TH].

The mullet, we use to eat em raw - what we use to do the mullet we use to cut em straight through and put em in shoyu and chili pepper, have you tried that?Yeh we cut em straight through just like the cucumber, straight through, and throw em in - put a little salt and shoyu and chili pepper inside there, ho *ono*. You eat with the hot rice, *ono*. You eat em like sashimi, like that. The meat by that time turn black yeh, from the shoyu, it's *ono*, you eat that you know, get that little bite from that chili pepper, that's how we use to eat em. We use to eat em raw and steam. That's how - we use to steam the mullet and the moi. Of course we fry em, we dry em. We dry the mullet and then we go fry em and that's ono again! At that time you gotta salt most of the fish because no more ice box. At a later date, then get ice box [TH].

My grandma - we get the salt from the Hanap *ēpē* people, the Aukona family like that. That no worry because they give em by the barrel, so you always got. And then what we use to do we use to salt the fish and the turtle and whatever, and you know the kind you go mix poi, the crock, that's how we use to salt the things because inside there no can come rusty the crock[TH].

Yeh, they get that salt cabbage and black beans, that's how my wife make. You can throw green onion inside there but overcook if going steam um. So we only put the black beans and the salt cabbage, that's it. That's our way, and of course you going put ginger and garlic inside there. Chop em all up. My wife no can eat shoyu so we just steam em like that, then you put on your own fish what you going eat because the black beans salted eh. So that's where your salt is, right there. You like put shoyu, you put on top your own after you take your share...we steam em with the oil. We make that and we go make even the nenui, taste ono too. Cook em with black beans, or sometime for fast action cook em with shoyu and oil, garlic, just steam cook. That's it. Only the water from the fish stay in there but mostly going be oil and shoyu. That's how I cook em [TH].

Well, you can put em [*limu*] in the soup, when you boil moi and stuff like that. Even the stew you throw that inside, that's ono [TH].

The *kala* everybody used to just pulehu that thing. The moi, we always liked to just fry it. Mostly we just would fry it. Sometimes you steam it but takes too long to steam it! [CW]

#### 4.5.6 Open Turtle Season

The turtle go eat all the *limu* and the fish no more food. [*Limu*] grow way on top just like one pasture on top the *napapa*. Before not like that, now the turtle he go on top the *napapa* he no scared you. Now get too much. Before that the *honu* dig out when we use to pound em. But you know what the fine for that though - you go catch the *honu* - \$55,000! Big fine when you go full around with that. That's why nobody like go touch that turtle, they go get em night time some.... They should open the season: one a month for one family you know what I mean, whoever eat that thing. And us we eat that thing, make good steak that -- mo bettah than beef steak because soft eh the meat. Like us we use to go catch em, cut em all up, salt em or make bar beque. That's the best, you put the turtle and the beef steak over there, they going eat the turtle because that thing going melt in your mouth. And then you gotta get good hand to cut the thing too because if not your whole house like if you go eat that turtle and your hand no good like when you talk to me I can smell you. I can smell turtle on you. And the people outside the road can smell the turtle cooking because the hand no good. The hand get lots to dowith that kind meat you know [TH].

Before we use to make that kind Kalalau cook, and how they use to live they use to clean all the turtle guts eh, we put the wing inside there, we cook em with the turtle fat, no need put oil inside there. And what we used to use for make em just like the garlic, we use to use the orange leaf. We throw the orange leaf inside there. It's ono! By the time everything all *palahe*, you just slam that thing right on your rice or whatever in your bowl. We eat that way. After you warm em up everything all *palahe* eh, the meat and the liver and all that man it's *ono*. We use to do that, we call it the Kalalau cook. Kalalau cook we use to make one big pot and put all that things in there [TH].

#### 4.5.7 Limu Gathering

All over get good *limu*. Well, most places get the *limu kohu*, and the only place get the other *limu*, but not too much now is at Kanaha. That's the only place. They get *limu pepehe*, *manaua*, *lipoa* - little bit not plenty. Before the fish go eat that, but you no can eat the fish. Smell. Too strong, but if only little bit, not too bad...I know where get so. So when I go catch the fish over there, I smell *lipoa*, I know where the fish came from. But we go eat, but not too much, only that particular place get [TH].

Our place no more that kind stuff like that. the only one that use to come plenty on the sand was *limu pa'apa'a*. The flat *limu* the one just like paper. When the *limu pa'apa'a* stay the moi go hide because get plenty small crabs that live in that thing, like Waimea. That's when they go *kokone* over there and catch moi and 'o'io inside that, when they see the *pa'apa'a* on the beach. That's the only *limu* that I see plenty on the beach, well use to get that and the *limu kala* but not anymore because the turtle eat em all. Like before we use to go fish, we use to go look *nemue*, get plenty *limu* rub against your leg, they eat your leg you gotta go with pants so that the *limu* no rub your leg when the wave come. Today no more that kind, the turtle eat em all. That's why the *kala* today no fat the *kala*, because no more their food [TH].

*Kala* and *lipoa* almost the same, but the *limu kala* is more thick and tough. The *lipoa* is short, but same color - brown. The *limu kala*, well I wouldn't say get smell - get some kind particular smell. Like certain *limu* get smell eh, like the *limu kohu* you know what I mean? The other *limu* no more smell, and then of course get the *lu'au*, the *limu*, *limu 'ele'ele*. The *'ele'ele* get a little smell like the dark hairy one, that's the *'ele'ele*. Get plenty other different kind *limu* yet, but these are the ones that they[turtle] eat all the time [TH].

#### 4.5.8 Gathering 'Opihi

Get [*'opihi*] but the screw-up when they market. That's where we lose em. When they start marketing that thing that's when we lose em [TH].

#### 4.5.9 Beach Erosion

The beaches were bigger than. We're seeing shore line erosion now. The beaches are significant ...in my mind they're significantly smaller than they were. You can see that in just the land falling down and the erosion that we're witnessing now [CW].

Photo 64. Kā'ē Beach at low tide

#### 4.5.10 Tsunami Impact

The other really significant event that I think had contributed to Hā'ena being really underdeveloped and really maintaining its rural lifestyle, were the tsunamis in 1946 and 1957. Those had a really profound effect on the people alive at that time because of the incredible damage that was done by those tsunamis. When I was growing up I remember all of the coastal areas of Hā'ena...just seeing the slabs of where the houses were...nobody wanted to rebuild along the coast. Because almost within in ten years you had two severe tsunamis, so it was fresh in everybody's memory. But by 1967 the most recent tsunami was ten years away. It was beginning to fade in the memory of the people, and as new people came they had never witnessed or understood the power of those tsunamis. So really, '67 was the beginning of a lot of change [CW].

#### 4.5.11 Surfing

It was in the early '70s that I got to come and actually live out there in Hā'ena with my grandmother. Those were really amazing years because it was still very undeveloped, still rural. Change was beginning, the surfers were catching on. The surfers had caught on to that Kaua'i has awesome waves, and we were getting surfers from California and other places [CW].

#### 4.5.12 Shark Grounds

My understanding of the shark home is actually in Makua in the outer edge. That is the hereditary home of the shark god. These are definitely his cruising grounds; they're definitely his front yard here. But my understanding is the currents are very deep off of Makua - the currents never cease even on the calmest of days, the currents always swirl in there and it goes deep onto the reef. I have never been able to swim, even on the calmest of days, in that corner of the reef. I can show it to you where Makua comes. Makua Reef is the Tunnel's area - off of Tunnel's [RW].

The ocean comes in in a big way there. I've also been there on the *heiau* and I've watched a whale shark go by on numerous occasions. There's one that does his regular route, so those are absolutely massive. Another time I saw it on the trail above this *heiau*, when you get into some higher grounds - I was able to watch it approach from very far away, come right off-shore right here at the *heiau* and I could tell by the scale of the people and the whale shark that it was an absolutely massive animal. So I know that he makes his annual cruise through there this particular whale shark. I'm sure other people must have seen it. My brother was there also on one of the occasions too and saw it cruise right off beach itself the lagoon [RW].

###

#### 4.6.0 Cultural Resources and Use

This category includes traditional Hawaiian cultural resources and practices and other ethnic resources and practices. The traditional Hawaiian cultural resources and practices, includes the Pre-Contact Era, as well as cultural practices after Contact (post-1778). Cultural resources can be the tangible remains of the ancient past or the traditional *wahi pana* or sacred places, or any cultural gathering place. One of the most significant traditional Hawaiian cultural resources is the *heiau* or places of worship. Other places of great significance for all cultures are the burial places of loved ones. Unfortunately with the massive transformation of the landscape as a result of the many western industries [i.e., provisioning, sandalwood, cattle, sugar, tourism, urban development] coupled with the secretive nature of ancient burial practices, most of the ancient burial places are unknown or forgotten and are easily disrupted and disturbed by modern subsurface activity.

##### 4.6.1 Burial Sites in the Park and Vicinity

There's lot of issues, small issues, there's lots of em. Like in Hā'ena they had that burial thing -- the iwi. That was a big thing, but you know what, those guys, they stupid, that's not their iwi. That's burials over there all along the coastline. We use to go fishing night time all spooky, the whole place. We know that. And my dad said they tried \_\_\_\_ in Naue, that whole flat over there, guarantee all iwi, that's why they been find that one over there. And these people who think oh because the place name is Kounui, ah they say the Kounui family was buried there... ah bull shit, they don't know, they not sure. Now they all confused now. Even Jeff Chandler, same thing, Jeff Chandler he went talk -- that's the family.... That's warriors. And I know the place. No more other people that older than me in Hā'ena. I'm trying to help out, giving information while I'm in a good state of mind [TH].

I guess way back in the 1300s -- 1600s when they tried to come over here and conquer this place. They never did conquer this place because every time they tried the warriors over here would kill em. That's why they call the place Waikoko because that's where they use to kill em. Waikoko means blood water eh. Over there that's where they use to slaughter those kind people or they go chase em with their own kind canoe and kill em, take em down there to bury because big flat and sand. [They came from] off island I think coming over here to conquer this place. Like they did in Honolulu up by the mountain and dump em all down...the kind place like that, over there and like on top the Pali. They make that song like over the Pali yeh. That's how Kamehameha became the conqueror of the islands because he did that. That's why a lot of people don't know that the people buried in those graves over there. Now they do excavation -- so they gotta find something, but again I blame the real estate people because all these Hawaiian lands, get that kind stuff on these Hawaiian lands; and no more marker [TH].

Kē'ē get too, you know why? Kē'ē was a staging point for the people when they going back to Kalalae and maybe the \_\_\_\_ come pickup, drop, they no can go eh and if the people die they going bury em right there. But over there had plenty *paepae*, the other side of the *pali*, they had plenty stone kind formation around so you know that get grave yard but some places no more you know. Like where they had the cesspool they went go dig over there they went find bones over there, right by the toilet -- the new one, all over there, even in the front. I see people sleep on the ground over there, they sleeping on the buried bones [TH].

Photo 65. HSP Comfort Station

All that whole coastline - I no care. That's why when we go fishing over there spooky - use to be spooky for us night time, but we no care. We throw em off, like if we going down and run into em

we tell em you know what, my dad *po'e kaua*, Freddie Makua going *iluna* go up, but we still going down, so the thing he head up there where we not going, we going down so the spook *pau*. That's how we use to do it. And then when we go *holoholo* fish night time, we no say nothing, we only tell we going *holoholo* but not where, we just go, even day time if we going hunt, same thing, we just go we say we going *holoholo* but we no tell where otherwise this kind they wait for you. That time was haunted with devils when we go fish night time [TH].

I know there is one kid who got into trouble and thought he could hide out at the end of road in the *halau* area and that no one would come and find him. He said that he lasted a few hours there after dark...he said there were so much noises and voices and nothing and nobody could be seen and he couldn't take it [FBW].

[The iwi is of people who used to live here and] I think warriors too. That's what I think, that's why plenty eh? All along that coastline, even over here [looking at map], Kaloli, Kaloli inside here along this bank over here sometime you see the bones fully framed standing up --side-down, sideways, whatever. Just like they been throw em inside one hole like that--that's all sand eh. So when the sand goes the high waters go eat em, eat em, then you see em all falling down...you see the whole frameworks well within the sand. All that place like that, even the Rice's, the one we were talking about. Before when they went bulldoze the place before 1946, they went bulldoze all that place make em flat eh [TH].

And then I'd say, 'Okay, why don't we have the Burial Commission get land from the DLNR, half acre or acre, several different places, pick up the bones, carefully envelope them with the prayers and take them to this piece of property which then becomes a memorial park. Inter the bones there again and put a plaque with the names of the people from the *ahupua'a*...their names are in the Great Mahele...because those are possible ancestor of those bones...and those are the one names that we have...the most...the deepest listing of names that we have. But you get these fringe people...mainlanders come in...and they're going to tell us how to do things...and they come and make all of this great fuss [FBW].

We have Darren Mahuiki here who knows where his family is buried, and he got permission from the owner of that little corner...and you'll see it over here, it's marked 'Burial Place' now...and he has turned that into a garden And that is where his family bones are. The Smith family who are in the Park, they took where their family was buried and they turned that into a garden too. The Hashimoto's have their family, at least two generations that I know of, that are in the little hillock back behind the house. So these are three families here in Hā'ena who know where their family bones are, and they are taking care of them. And I would be the first one down there to fight off anybody going in there and moving those bones and disturbing them. That's one thing with the State Park thing, as far I'm concerned, that need to be kept in place and marked. Here are three families who know where their bones are and are keeping them, and doing something about it [FBW].

If you go there, just to let you know my great-grandmother is buried over there, her name is Ka'aumoana Moa Niau...the one says Moa, her whole name is Ka'aumoana Moa Niau. Come from Ni'ihau, get plenty family there, Niau -- my mother's relatives... Kaenaku-- you know the first one, that's the daughter of Mokuohai -- I don't know the rest [CM].

##### 4.6.2 Traditional Hawaiian Sites and Legends in Hā'ena

###### 4.6.2.1 Heiau and Hula Platform

The Kauluopā'oa [*heiau*] and Keahualaka [*hula* platform], you could see it from the beach [CW].

As a side note that very few people know is that in the '80s with *Halau Hula o Mililani* we went up to the *heiau* at night. We made torches and placed the torches where the big *pahu* drums are said to be facing the altar. What happens is that the dancers cast a forty foot shadow up on the wall and that is clearly visible from every area around....so the images of many dancers dancing on the cliff walls ... combined with the various acoustics. There are certain places along in here that if you stand in this one spot...the acoustics... you can hear the entire cliff wall far away. You step one inch on either side of it, you can't hear it. I can show them to you when the sea is calm. When the sea is calm it's much easier, as you walk along the beach you can...you'll actually be walking along these acoustic windows...they're short but you know exactly where to stand to hear somebody way far away in the back of the cliffs. So there are some acoustics on here ... which are common in many heiau....Hauola over in Waimea, Kekaha side is clearly an amphitheater...as many of them were. The chanting style of passing over mountains ... and the long distance too...I'm sure was practiced here [RW].

People were still living there yet [when I was growing up], the people would go teach hula over there [by the *heiau*] -- the old lady Wahinekouli, she was the teacher over there; and then the old man Kila went go.... [Hula people] still go over there clean up that place and go *uniki* over there [TH].

I know people have [gone up to the *heiau*], but I can't give you specifics on that. I just know that there are people like me who have gone up there and left their *ho'okupu*...and said thank you for what's happened and what's going on. It's a place that's rich with all kinds of ghost stories too [FBW].

I think the archaeology at this particular point will take its own particular course. The heiau is itself .....especially when it comes to the hula...you need to separate it out for both hula and for the heiau...they're two separate things. Even though they could be under one house ....but yet even then that house is divided into two separate categories...one is for the heiau itself and the other one is for the dance platform. They're two separate functions. Although it's all in the same because as you go up you're making your *ho'okupu* to the *heiau* itself, and then the *hula pā* is the secondary aspect of it. Once you've cleared the way through the *heiau* itself, now you're on the *pā*, and then now you do what you need to do to Laka. But there is a little bit of a gauntlet that needs to be run, and the protocols to the main *heiau* have to take place [RW].

Photo 66. Ke-Ahu-a-Laka

My understanding is when Kē'ē originally shows up in the material it's during the Mo'ikeha and La'amaikahiki saga. In that La'amaikahiki promised to Mo'ikeha that upon his death he would come back from Raiatea pick up his bones, intern them there at Taputapueta of which he had a hereditary role there with his grandfather, Maweke. When Mo'ikeha passed away his bones were kept in Kē'ē, right there at the end of the road for safe keeping, until La'amaikahiki's return. La'amaikahiki comes there, picks up his bones, goes to O'ahu, sires that royal line, and then goes back to Taputapueta. So that is my understanding where it first shows up in literature, the oldest. Already back then the school was evident as a place of history -- the school for historians. There's always been a center of history -- this would have been your PhD in all the various chants. I think a really good, more modern, but still shows you that even in the 1880's we have really good description of historical ... I'm jumping ahead a little bit but I'm just showing that even as it comes up to the early 1890's -- it's still very highly respected [RW].

My particular involvement, of course, has always been *heiau*. I understand that Auntie Kauai Zuttermeister has a connection here also with the Kaula Pā'ao, also the *hula pā* at the top. I think

there are only one, two, or three places in Hawai'i where the actual *hula pā* is incorporated in the *heiau* itself, so it makes it rather rare, very rare [RW].

I am aware of Kekahuna doing the map itself with Theodore Kelsey -- the dynamic duo -- can't think of Kekahuna without knowing about Theodore Kelsey. That was another part of it. I know that in the thirties the Kaua'i Historical Society hired....and I'll get the name again...it might have been Thomas' father or one of the more prominent residents. I'll have to look it up again. But we have all the pay stubs and all the materials, the monthly reports as we got from....at the same time the Historical Society had someone else working on the Wailua Complex -- Poliahu, Holoholoku, Hikiakala also -- full time hire. And for years the Kaua'i Historical Society maintained it. I was getting up to Kauai, Auntie Kauai Zuttermeister, which Roselle Bailey comes in and from my understanding there is a falling out over this heiau between the two. But I always wanted to be able to, obviously it's too late now, talk to Auntie Kauai Zuttermeister. I've always been meaning to go through her particular notes and papers on anything having to do with this....which I have yet to do. And I don't even know if you can or not....depending on the kind of notes she kept [RW].

Pā'ao was Lohi'au's best friend and retainer, and took over his responsibilities when Hi'iakea brought him back to life took him to the Moku o Hawai'i, where Pele rejected him, and he came back and lived a normal life. His sister, Kilioe was a sorceress and also the primary teacher in the school at the time. The whole Naupaka legend begins with her. She was rather a dangerous woman; you broke a *kapu* that was it! Accordingly, the stone right there in front of the *heiau* on the beach, right here, is Kilioe. That big one with all the -- when they say they put the piko into it, that stone is Kilioe. Kilioe guards the grave that Lohi'au is in. He's behind the stone, in the hollow part of the hill as you go under -- the chambers underneath and behind the stone, according to the 'olelo that I understand [RW].

Do you know who Henry Kekahuna is or was? He was a very famous historian, he was the mapper. He did a map of Ka Ulu o Pā'ao, and he did a whole kind of narrative on the side of the map about it. That was really interesting, if you haven't seen that you should let me know, I think we got a copy of it at Hā'ena...at Limahuli. We should have it [CW].

#### 4.6.2.2 Pele Connections

There is a chronology, (1) there is a genealogical chronology of the paramount chiefs, (2) there's a second chronology in the historical sequence which just shows up in our records, but there are many aspects to it, many portions in the history. So we're starting out in the 12<sup>th</sup> century with La'amaikahiki and Mo'ikeha, and Pele and Hi'iakekapoliopole also begins there at Hā'ena also. Having grown up with the Pele stories from my youngest age, and being a soldier for Lohi'au, my relationship with Pele has been quite spiritual...but because of the whole Pele, Hi'iakea, Lohi'au connections as to the beginnings there, is a critical point in history for understanding the importance of this particular site [RW].

The first legend of Pele is set at Mana...that's the Pā'u o Hi'iakea legend. They come into Mana, and the first battle with Pele and her sister takes place on Kalaheo side, at Kukui-o-Lono. And you have the legend of Pele and the *'ōhelo* berries. And of course the whole Pele, Hi'iakea, Lohi'au story, but that one gets very complex because you not only have Pele, Hi'iakea, Lohi'au, but you have Lohi'au's sister, Kahua. And you have the Chiefess in charge of the *hula halau*, Kili'oe, and Kili'oe is turned to stone by Hi'iakea and she's still down there at the end of the road. And my grand-daughter's piko was placed there -- she's taking care of it. So it's still kind of in use by some of us. And then Limaloa is Lohi'au and Kahua's brother. All of the Limaloa legends in my (???)...mirage that used to be...Limaloa catching the *uhu* off Hilo and there's the story of how he gets put into the mirage is part of the (???). Just so that you know, you know where Lohi'au's site is...that stone wall...my mother saved it [FBW].

#### 4.6.2.3 Other Legends

I never talk to my mother or my dad. My dad would know about all this, the legends. Like they talk about the Piliwale sisters above the dry cave...they all stone figures up there. Some day when you come here I show you.... Way on the side of the hill, Pōhaku Kāne stay over here some place you know. We look right from there eh. This is the start...that stone right up there, that's the one. And then Mānoa, the Piliwale sisters are up here somewhere because it's on the looking up it's on the right side right above the \_\_\_, you go look all that stone figures up there, get three pointed kind like that....[can see] right from the park -- the same side, and look straight up [TH].

We can go through the various stories. I know we have the Kihawahine activities going on with the Mo'o goddesses that were luring strangers into wet caves [RW].

My only one [mo'olelo] are the two dogs, but they're down over along the beach in front here, and in front of this County park. Because you know right in front of our house was that Hale o Pōhaku, which was a dog heiau. According to Tommy Hashimoto, the people who used to work down along in here and along in the park area, when they would ride home in the evenings a little white dog would come out...out of the woods and trot along with them until they got to the point where Hale Pōhaku was and the dog would disappear. I saw him once...really adorable little dog...kind of spotty face. And the other dog is the big black one, and he's supposed to come when there's going to be something bad happening...but he comes from the other side. He comes over this way and he kind of disappears around the dry cave. But he seems to be much bigger when you see him in the distance, than when he comes towards you. He just seems to slowly get smaller in size....odd looking thing [FBW].

### 4.6.3 Traditions

#### 4.6.3.1 'Ōahi Ceremony

The stories that I heard when I was growing up...it was like a fire throwing ceremony from the top of Makana. And that was really one of the things that drew people to Hā'ena in the ancient days to see this amazing sight. To my knowledge the 'Ōahi ceremony was only performed in two places in the whole *pae'āina*, and that was Limahuli off the top of Makana and at Kamaile down at Nu'alolo. Probably it had to do with the geological formations, the direction of the wind, and the up currents of the wind, but it was a ceremony where they used *papala* or *hau*, both of which were really light woods that were very flammable -- both have like a hollow pith or core. And while on fire they could be thrown and be caught in the updraft of the wind -- it must have been pretty spectacular. My understanding was that it wasn't like it was every full moon or something like that [when they did it] -- I don't even know if it was even related to things like the Makahiki or the four seasons [CW].

Photo 67. Pu'u Makana

I never did [see people throwing fireballs off of Makana], but my mother did. She said it was 1912. And I've seen a date somewhere recently where somebody said it was later than that, but I don't think so, I think it was 1912. I know La'a Mahuiki was one of the people, but he was a kid at the time because my mother was twelve. Of course, I think at that age what you remember are the brands floating -- the sticks with the sparks coming out the back. And it never occurred to her because she was afraid to ask how it came about. It's like me, I look back and the people that I remember, I wish that I knew what I knew now so I could ask the kind of questions that I should have asked! [FBW]

My grandmother remembers the 'Ōahi taking place. She was there the last time the fires flew from Makana. That was in 1910-11... it was one of the Maka's or Mahuiki's who went up and did that.

My uncles probably remember it easily. I guess I don't really want to go into all the lore and history of it, because I think my father would be able to go through a bunch of it [RW].

Another reference is 'the sparks from the 'Ōahi creating a feather cloak as it enveloped and draped over the whole bay.' So as you had the sparks in the shape of a feather cloak, you had all the people in the canoes, you had all the people on the beach, you had all the dancing, it made for a phenomenal spectacle [RW].

We knew that there were numerous ceremonies that everybody would gather here along the beach and in canoes [RW].

#### 4.6.3.2 Kē'ē Pu'uhonua and Halau

The references that we have in the Historical Society - one particularly beautiful one was done by Emory's daughter in the forties and it's coming from Hanohano Pa - John Hanohano Pa. In it and earlier, we have references by his mother and his grandparents, also records from them. She distills it, but even then the entire Nā Pali Coast understood that if they were able to reach Kē'ē Beach right there in front of the heiau, they were safe [RW].

There are stories of robbers and bandits along the coastline, and canoes making a mad dash for the safety of that end of the road there [RW].

All the Kalalau, the Nā Pali Coast, went to school - especially the women - all went to school there [Kē'ē] - they were all trained. And speak very highly of it already even in the 1880s and '90s and 1910 the school continues to operate it seems like. But you can make up your own mind when you start reading this material [RW].

#### 4.6.3.3 Gathering Rights

Take the gathering rights -- the gathering rights belong to the ahupua'a. You didn't have gathering rights in any other ahupua'a. And this is where you will find people like Tommy Hashimoto who will not fish in Wainiha. He doesn't go along the reef in Naue because that's Wainiha, not Hā'ena. He fishes only in Hā'ena because that's where technically he and his family belong within this ahupua'a, so he doesn't go around the whole island [FBW].

#### 4.6.3.4 Fish Gods

The fish-forming stone is, although to a lot of people they don't know it, but to me it's rather common. But mostly those fish stones were given as gifts to the mountain. What would you give the mountain is a gift of the sea. What do you give the sea is a gift of the mountain-- the exchange between sea and mountain, right? So you're bringing up these basalt fishes up to the mountain, you're bringing up the coral up to the mountain for your *ho okupu* - as your gift to the deities that live up there. And in return you bring the stone and the material from the very top of the mountain to the edge of the sea. That's how you're making that connection. The fish were an important part, you see it in Maupiti, you see it in French Polynesia, you see it in other places - the occurrence of the fish, the basalt fish [RW].

Photo 68. Possible fish god stone

The old man Hanohanopa'a, he supposedly had one rock he used to pray, and the fish would just come and they would line up. But after he was gone, I don't know, I don't think there's anybody like that any more [CW].

#### 4.6.3.5 Hā'ena Rains

And the noe noe! How do you know which one you're under going? And you can see it...there's one rain that I like to see is Lilinoe but it may be Noe...this very fine fine rain that soaks you immediately...you get wetter quicker with this fine rain than you do with the big raindrop. And I look at that and I think here are three main kinds of rains and I don't which one is which! [FBW]

#### 4.6.3.6 Hā'ena Boundaries

For me, I don't feel right until I get across Mānoa Stream. To me that's the boundary, right by the dry cave. Once I'm across that stream I'm in the zone...I'm in a whole other world....I will **not** cross that stream for **any** reason until I'm ready. So that's just my particular thing, once I'm across the stream I do not cross it until it's absolutely necessary. I stay from the dry cave to the end of the road, that's my turf. That's where my heart is, that's the center of my universe, that is my ahupua'a, and I have a sense of responsibility with the years of work that I've put into it [RW].

Photo 69. Mānoa Stream going over road

#### 4.6.4 Ali'i of Hā'ena

Hā'ena was unique in that when the Mahele took place, the main ahupua'a of Hā'ena was given to Abner Paki who was not *kama'aina* to Kaua'i. He had, as far as my research has shown, he had really no relationship at all to the place. It was more of a political bone that was tossed to him. So the true Ali'i from there...there is no record of it...Mahele records show that Kekela was the *konahiki* at the time of the Mahele, but she was from O'ahu, she had been brought over. So we don't really have a record of who the traditional chiefs of that area were [CW].

Kekela that was the High Chiefess here, she was sent down by Kamehameha as one of the messengers to Kaumuali'i, and Kaumuali'i took one of the messengers by the name of Kihei, and gave him Kalihiwai Ahupua'a. So he stayed here and when Kekela came, he gave her Hā'ena. And Hā'ena has always been ruled by a chiefess, who is independent of the ruling chief. When the ruling chief changed, the Hā'ena chiefess was never deposed the way that the *konahiki* in other *ahupua'a* were. And at the time of the Mahele, she came to Hā'ena and made sure that everyone who lived here made a claim. Where as Abner Paki told the people in Lumahai that he would take care of them, so only three people made any claims in Lumahai. Kekela lived most of the time, I think in Honolulu. Her home was...my mother's house is built over the platform of Kekela's house. It's built over the chiefesses's house site -- there's a stone platform underneath. She deliberately built the house over it so it wouldn't get damaged. I don't remember [any more about her], but you can track her down by going through Kamakau -- I'm sure there are other places; I've never really followed her. My interest has lain with the place names and with the history up until the end of the Kaua'i Kingdom, so called. So anything from 1824 forward I haven't really gone through. Information kind of spreads over that period, and I've never gone back to track her down [FBW].

I know that the last Chiefess of the area was Kekela. Chiefess -- rule by women -- is another important part of it. I need to preface with the Kaua'i chiefess, Kekela. She's all over the Mahele books and I'm sure there's probably some research to be done. My grandmother's home was actually on her compound...is on her compound. Everything that is there is still there and absolutely pristine, untouched. We had Emory come in -- my grandmother hired Emory in the early sixties or so to do some work in the back of our gardens and the reports are there. I know all of Emory's carbon dates are in question, but he had some old ones [RW].

That [where Juliet Rice lived] was supposedly where the Ali'i lived and that's why that area was *kapu*. I know before my grandmother was allowed to live there she had to talk to the old folks ... she had to go talk to the *kupuna* and get permission to go over there-- to the ones that were passed already -- to the spirits. According to Uncle Tom there were *kahuna* in that area, powerful ones. But by the time we guys were growing up they were all gone already ... She told us before there was no electricity; the spirits out there were strong. And even Uncle Tom, he said they go fishing like that, they see the hala tree on fire and they come over there and no more fire...they see fireballs...all kinds of heavy stuff up there. Now you don't see that kind of stuff [CW].

#### 4.6.5 Kē'ē – Nā Pali Connections

That particular connection -- and that's Wahinekapi, which is Hanohano Pa's mother and grandmother, grandfather also -- it's a male name too, Wahinekapi, but it's coming from 'Rebel Woman' which was the name given to Pi'ilani, who was Ko'olau's wife. So we see Ko'olau's wife, the family name there [Kē'ē] and Kalalau -- when they were all evicted in 1893 because of their role in helping Ko'olau. The Provisional Government immediately after the overthrow banned everyone from Kalalau and dumped them on the beach right here at the end of the road. And there they made their way in through Kaua'i. Some stayed in Hā'ena, others moved on, others moved off island and went elsewhere. But the entire Nā Pali Coast essentially came in on the beach right here and then entered into the new society, if you want to call it that, from Kē'ē Beach. It was because of their role in helping Ko'olau, the leper. Without going into that whole story, you know, the point that I am trying to make is the interconnecting of the Nā Pali with this whole bit and the far reaching respect that the school actually had [RW].

#### 4.6.6 Kekahuna: Park Mapper

The [Lohi'au] *heiau* is right on the corner where the trail start. That's where it is. I went work on that project, the *heiau* project with the old man Kekahuna from O'ahu. He was just like one archaeologist eh. He draw all that, just like one archaeologist. He put down everything. You like look at that map you go to Kaua'i Museum they got em. In fact I think stay in Honolulu too. You go look. That man was an intelligent man that...go look on top that map went explain everything. Was me and my Uncle Ralph Kanehe, old man Kekahuna, and the *haole* old man use to be -- all stay on that map, that drawing. You go look at it, get all the information right from there. I know that, because he gave me one, but every time they make this kind paper they give us this kind. That's why this one they laminate eh? That's why it will last forever. I get plenty of this too [TH].

#### 4.6.7 Cultural Identity and Balance

Establishing our Kaua'i identity, naturally, is a big deal for me. We do have our unique aspects, as each island needs to pursue their own specific cultural identity. Yes, we all belong to the same tree but we have our gifts also. And each island has a very distinct separate history because they have different genealogies. They have their own uniqueness that each island needs to seek and then adopt, and then relive them. And naturally, here on Kaua'i we have a big movement going back to seek our own cultural identity, and that part of the *kapu* is very important because now we're far more inclusive. So, no, I don't mind when women help us build rock walls. They did in Nu'alolo Kai, right? It's all incorporating. And when we do all the religious ceremonies, it's all male and female. It's not right unless the *kauna pule* that's both male and female. Here it just doesn't seem right to have a ceremony without the balance. Neither does it seem right for us to do the genealogy and leave the women out of it. So I do the male part, the women do the female part as we come up through the [genealogy]. But we're developing the female side of it right now. Having suggested to many of the women here that they need to get a lot more serious in collecting the female aspects of it...so you can see the duality when we do our genealogies [RW].

###

#### 4.7.0 Thoughts/Concerns about Hā'ena State Park

Change often meets with resistance, especially change of lifestyle brought about by outside entities. People who grew up on the lands often don't want to see it changed, especially if it provided resources, recreation and respite. They also understand that things don't stay the same, and change could occur with cultural sensitivity. The consultants shared their *mana'o* about the future of this area; some of their thoughts are stated below.

##### 4.7.1 Heiau and Hula Pā

Just like one of my dreams with this Park here down at the end of the road. I would love to see the *halau*, the *hula halau* area, and Ka Ulu o Pā'oa -- I'd like to see it restored and used. My idea was over by the parking lot put in some sort of a building so that any *hula halau* in the State can perform on the *halau* platform with the understanding that they put on a program for the public which would be taped and begin a *hula* historical record -- a depository -- so that these things that are so ephemeral are not completely lost. Because I think of 'Iolani Luahine -- we have only one or two clips of her dancing and yet she was absolutely ...she was incredible! The minute she started, a possession took place. It was just incredible. And then, I think, there is so little of what she did, and I think this is one of the best places where you could set up something like that. I think you could end up with something that would be for a nonprofit organization running that sort of thing. And then, of course, you'd have a source of income being able to charge something to go to the performance. The *halau*, in order to be able to use the place, the actual school, would be, I think, somewhat of a good thing. I would think if I were a *kumu hula* to one of the most famous *hula halau* areas is some place that I could actually get to with my crew, would be something I'd want to do. And a few have done it in the past. But it's too dangerous right now. And too many people are going into it and lifting stones, and taking stones. Our former Postmistress used to dread getting these boxes addressed to 'whoever is in charge of the *halau*', because she said people would take these stones and then send them back. I don't know...something happened to them...she said you could just feel this mana! To me the only way you're going to save this, is to use it [FBW]

Again to me that should be directed to the practitioner's who use that [*hula* platform and *heiau*]. To me I think it should be cleaned up because when it's overgrown, the way it is now, the roots ... the trees and stuff...they're busting up all the rock walls. In my opinion, they're desecrating it. The challenge is that when you clean it all off, then all the tourists are going to want to go up there. So how do you control ...it's always a two-edged sword ...that kind of thing. So I think the master plan has to address ways of protecting cultural areas from just being considered public domain. The whole western [mentality] is so... "It's a State park and I'm a U.S. citizen, then I should be allowed to go anywhere I want in the State." That's not how this park should be operating. But I do think it would be ...it should be better maintained...it should be cleaned and better maintained. It's a really impressive site, like I said when we were growing up you could see all that -- I think Uncle Tom was the last one to really clean it really, really well for the Historical Society. It must have been like twenty years ago the Limahuli Garden was working, we were cleaning it, volunteering and going down there and cleaning it CW].

I think the archaeology at this particular point will take its own particular course. The *heiau* is itself, especially when it comes to the *hula* - you need to separate it out for both *hula* and for the *heiau* - they're two separate things. Even though they could be under one house, but yet even then that house is divided into two separate categories - one is for the *heiau* itself and the other one is for the dance platform. They're two separate functions. Although it's all in the same because as you go up you're making your *ho'okupu* to the *heiau* itself, and then the *hula pā* is the secondary aspect of it. Once you've cleared the way through the *heiau* itself, now you're on the *pā*, and then now you do what you need to do to Laka. But there is a little bit of a gauntlet that needs to be run, and the protocols to the main *heiau* have to take place [RW].

##### 4.7.2 Lohi'au Site

The Lohi'au is another one. It's overgrown its right by the trail head. It's an area that kind of needs to be cleaned up. I think it would be great to have it cleaned up and have better interpretive materials. The whole park needs interpretive materials, it's really lacking, and it's one reason that most of the people come there. They just think it's a place to go swimming or lie on the beach, or throw their rubbish away in the bushes. They don't understand that in the ancient days this was like one of the Seven Wonders of the World with the 'Oahi ceremony and the *heiau*...this was a very special sacred area that in ancient days people made pilgrimages to come here [CW].

Photo 70. Lohi'au's house site covered with vegetation

##### 4.7.3 Master Plan: Cultural Methods/Protocol Recommendations

**Multi-discipline Houses/Kuleana** I really don't want to reiterate the recommendations we made on behalf of the County of Kaua'i Historic Preservation Review Commission. That motion and stuff is out there, that I think we'll address piece by piece as it comes as a Commission. But I think that my main point is that some of the cultural methods that you may want to consider in this whole thing. Number One, this is multi-disciplinary. You have the hale's, we'll call them hale's for now - the Houses - you have the house where all the...this area should be reserved as an archaeological preserve. And so therefore, for educational purposes, the archaeology should be allowed, but that's separate in its own particular field. You have the fishing, so another house is controlling...their only duty is to manage the fisheries of Hā'ena. Another house is going to be Marine Biology, which is the study of reefs...that needs to go on. Another house would be the taro, such as Hui Maka'ānana, which is the taro growing aspects of it right there. Then another house will be the house that actually is the *heiau* itself. So briefly, I know there's a couple of more houses and more disciplines that we're dealing with, but essentially you have these separate disciplines right here. Each is their own particular entity. I think it's pretty ridiculous to even assume that one group can handle all aspects of this...so there's room for different groups...their *kuleana* are very separate, but yet all of them are focused and the goals are all the same - making Hā'ena the jewel it deserves to be.

Number two, the cultural, educational, spiritual, philosophical reserve or preserve where all of that [the various Houses and their *kuleana*] is perpetuated. So there's a unique opportunity by laying the fundamental groundwork for the separation yet the unification of these separate houses. I think it would be well worth considering over a long range period. It keeps the arguments and everybody focused on their job, instead of one guy who is in every single camp, this just doesn't work in the long run. So, therefore, although I was there at the beginning of Hui Maka'ānana o Makana, their function is quite clear in the taro productions and the expansion of the taro lands,

and all the aspects of the taro growing that are going out there. They can expand into other areas, but whether they would be the group that would handle all the protocols and everything with the *heiau* that's different, that needs to be a specialized group... a specialized *kahuna pule* - the house itself - the protocols that need to go on in the *heiau* and all the activities need to be overseen by some very experienced people [RW].

**Fishing House.** At this particular point I'm not going to put in any individual, I could say that, for example, Jeff Chandler, he's a fisherman. He has a great deal of knowledge that could be added to the world of fishing. For example, he would definitely be in the House of the Fisherman. His ideas and his participation in the fisheries, conferences and meetings, and everything like that, along with Thomas Hashimoto, they know what to do in regard to managing the fishing resources... I think he would be really good with that [RW].

**Botany House.** A lot of this stuff in here - the vegetation is *kamani* - there's a botany aspect to it too, so that's a separate house too. There's a whole *la'au lapa'au* aspect that could be done here too, which actually creates a whole another separate house of botany....again, a completely different discipline, and under different goals and objectives, but still important to the big picture [RW].

**Mason House.** We were able to do that in the new Loko Kai restoration Project, in that we created the Mason House in all the restoration work. The Mason House included both males and females. It was their job to decide how the stone walls were going to be built. Once they knew exactly what they were going to do, then they told the Kahuna Pule House, and then they're the ones who decided how to open the door....keep it open....keep everyone spiritually safe....and close the door after we're done. It was their job to protect the masons while they're working. The Third House was the Na Pali Coastal Ohana which both the masons and the Kahuna Pule knew exactly what to do, and then it was our job that both of them got exactly what they needed whenever they needed it [RW].

**State Parks House.** The Fourth House was State Parks, which oversaw the whole thing to begin with. In the long run that methodology really helped focus the work and the energy. It kept people from being in too many places...and into discussions where they don't really belong. It facilitated things in the long run much better and made for a stronger more cohesive unit [RW].

**Cultural Methodology.** I think the main point that I really wanted to make is to consider the culture methodology and the way you organize the different disciplines. I think it's going to help you a great deal in the end. It's worked for us. Our cultural methodology and problem solving and work ties everyone together, keeps everyone focused, keeps the arguments, keeps everybody out of each other's hair, keeps everybody out of where they do not belong, but also gives everybody a sense of responsibility and a place - a sense of importance and a sense of a very specific responsibility. People need this to grow, but at the same time it's symbiotic, if we don't seek the symbiotic relationships we're not following the lessons we're supposed to [RW].

The cultural protocols that demand this particular approach just because of the site you're dealing with. You're dealing with one of the most important religious, cultural, historical centers. Our ancestors deserve the best. Naturally when you're dealing with these elements it is much safer to be operating on a much higher elevation of ethics and protocols. And in the long run it's much safer for everyone. But at the same time it ends up as a spiritual experience because in the end it is a ceremony that binds us together. Now once we've experienced the ceremony together we have something in common. So the ceremony is actually critical. As far as I'm concerned, the more ceremonies that go on up there the better, but that elevated protocol is critical in keeping everyone safe and respectful [RW].

#### 4.7.4 Master Plan: General Issues

I think by thinking that Hā'ena State Park is only at the end of the road is misleading. I think we have a duty to incorporate the entire footprint of the property for a long range plan. Although we're in expansion phases, you can break it up into many different phases. It breaks it up into more of a size - components - like building a wall [RW].

**Lohiau Complex Site.** The areas of concern - my grandmother, Juliet Rice Wichman was there when the County was going to bulldoze Lohi'au complex. She actually started right there in front of our house as we have the Pōhaku Kāne, the brother, the stone which is a fishing shrine is right in front of our house. The sister, which was on the reef, is now broken. She's in forty feet of water. But the County was going to bulldoze the boulder away; my grandmother laid in front of the bulldozer and stopped it. The bulldozer went down to the Lohi'au house site, was going to take it apart, my grandmother laid in front of it and stopped it from getting destroyed.... The Lohi'au house site is poorly mapped. And that the road is actually coming way too close to it. The car bumper is almost touching the thing...so you need to put a larger buffer around that.... A larger buffer needs to be established around the Lohi'au house site [RW].

Photo 71. End of the road turn-around

**Burial/Turn-Around Issue.** In order for us to do the turn-around areas you're in the most sensitive of the burial areas. As you start to get that footprint between the Lohi'au house site and the bathroom you have a very tiny maneuvering room right there and also, quite frankly, problematic [RW].

**Comfort Station Issue.** We always have these problems with comfort stations in sacred zones, culturally we give up a lot for this. In that some of us are quite aware of the circumstances of the archaeology of the bathroom - it made a lot of people uncomfortable. So I'd hate to see more of it going on, and that the existing footprint right now needs to stay. But still close within it are the preserves, because we have burials that are right in there, below and around the bathroom area. But we can presume that it's going to run along a particular strip along the dune. So that's why I'm thinking that people can either walk along the beach, or they can walk along the path that brings you a little bit closer to the loko [RW].

Photo 72. Comfort Station

**Foot Traffic/Pathways.** Although we know we're dealing with a sacred area, there are certain sectors that are clearly more sacred than others. The pathway in which the human traffic is going through is absolutely critical that it goes around features not too close and not too far, and without going through any of the walls. So there is a sensitive approach that you really need to put the overall paths in there. Because anybody who has any understanding of Hawaiiana and they see the path not properly placed within the landscape, will cause problems. But I think in that sensitivity right there...right from the get-go will help things a great deal. Photo 73. Footpath through dune

We know where the burial areas are, we know this by the hard way....well, we knew it already...but then again people needed to learn the hard way exactly where it was. So I think cross-culturally enough people know where they are right now. So we know where the pathways can be leading. I think I made the suggestion that the pathways are leading along the edge of the

loko, on the belief that most of the burials are there within the dunes. And they may not be right on the edge of the loko, but at the same time these are beautiful views...and also not only enhances culturally but also within the visitor...from the visitor's standpoint to the beauty of it is going to be really cool [RW].

**Fishponds.** These can also end up being working fishponds too. And so that could be another aspect under the fisheries but the wai fisheries also. So those are there as far as expansion capabilities. It would be nice to have it as a larger master plan ....and step by step work up to it [RW].

Photo 74. Fishpond Area

**Parking Lot/Auwai Impact.** What this plans shows...and maybe this is another concern...it shows the *auwai* being restored and running through the parking lot. While that might sound good, the problem would be drainage and what's going to happen with all the runoff from this paved parking lot - assuming it's paved - maybe there's other ways to deal with it. But if you got all kinds of oil and brake fluid, dust, asbestos dust from brake pads...washing in to the *auwai* from the parking lot...that would have hundreds of cars a day parked in it...it could be really bad for the health....I mean you're talking about food production [CW].

**'Auwai-Lo'i Expansion.** The water is going to be coming from Limahuli Stream. Right now, I know, it's tapped up above the road. In Limahuli it actually comes down through the *auwai*, crosses underneath the culvert, and reenters into the *auwai* that starts to feed the *lo'i*'s that are actually down there. That water has been flowing for awhile now. We may want to take another look at the water supply Hui Maka'āinana expanding their footprint. Right now the last time I saw it there were four big *lo'i*'s, however I know that Thomas Hashimoto had two or three other *lo'i*'s in the areas...and I know he wanted to open up too. So I think in visioning a larger master plan for the actual footprint that Hui Maka'āinana can expand their *lo'i*'s, with the foot-trails that are coming through there...that we keep it pretty safe...the terrain itself is not necessarily really difficult; although slightly undulating, the view plains through there are absolutely stunning [RW].

**Parking Lot/Lo'i Issues.** On the other hand, I guess, if you graded it away from that and maybe had a permeable surface paving...you know not everybody is going green...we know that hardscape is not a good thing...the more permeable surfaces we can create the better. The problem with a lot of these, though, is intensity of use. This park gets a huge intensity of use. So things like grass-green, grass paving, and materials like that would not be functional...the high rainfall we get in Hā'ena. But maybe there's...they have permeable cement and permeable asphalt...there's gravel paved systems. There's different things that could be looked at. This is probably the logical place, because it already has been destroyed and disturbed, to keep a parking lot. But I think environmentally how we deal with those issues in terms of the *lo'i*, I think, is going to be really important because the *lo'i*'s are going to be a really important part of the cultural landscape of the Park [CW].

Photo 75. Parking Lot in Hā'ena State Park.

I think one can easily vision the areas that Hui Maka'āinana o Makana can expand to taro patches. I think we can begin to envision what the experience of our visitors is going to be when they arrive there. That immediate connection into the taro patches to begin with, I think is going to be important. Having a trail that actually loops around the ocean front and actually makes a full circle from the internal parking lot, which we know is going to have to be expanded and is not enough [RW].

**Level of Recreation Use.** Actually a lot of effort went into this Plan. The biggest compromise we had with this Plan was the State continuing to say that it had to be a "recreational" park, and trying to define what "recreational" meant because of the funding that they had received when they bought it. What's good about this plan is that it more or less preserved and sought to restore the primary cultural features within in the park and to protect the *iwi kupuna* in the dune system. So I'd say probably the only thing that, maybe, I would have a concern with in here would be the level of recreational use. I'm trying to remember, I think there were bike paths and stuff like that. I think people need to have access throughout the park, I'm not sure that we gotta necessarily have bike paths throughout the park. I'd say that's just something we'd probably want to re-look at...the location of those paths and access ways [CW].

**Tourist Guides.** Like before, when the guy was drawing this thing up, the Master Plan, the first time they were talking they were gonna take guides - going get guides for take the tourists inside there go look the taro, go look the canoe, had the canoe down the beach, they had the canoe house on the beach side below the taro patch, and all that. I don't know because when these guys get meeting about this Master Plan thing eh, I don't go *maha'oi*. All Jeff and Kawika, Chipper, all those guys they go look. I know they had one meeting not too long about the Master Plan thing. For me I'm willing to dakine, but if they make funny kind like that eh they kill my fight too, even with this fishery thing too you know. They gotta cooperate too. Chipper went get me involved with that [TH].

**Walking vs Driving.** This Plan actually has a gate right here, so cars have to stop here. But this is such a short walk people should be able to just walk down. It's really beautiful. In fact, when there's no vehicles driving here--the problem there isn't a shoulder on the side of the road so it's dangerous to walk on the road now with the cars on it [CW].

How you're going to transfer everybody from the parking lots...quite the distance. I don't know if it's 300 or 400 yards or more - quite a bit more than that between the parking lot - it's a long walk for people [RW].

**Base Yard/Helipad.** The location of the base yard...I think once they have a little bit better of the footprint in mind, we need to take a better look at it. They are pretty close to a cliff line right there, and they're on the high side. The toll booth thing and exactly the placement and how that's going to happen, that's still yet to come. The helicopter pad is pretty important. I was there when there was a helicopter crash...rotated on the reef in front of the *heiau*. And for the FAA we collected and kept the helicopter from being washed out to sea, so they could investigate the cause of the accident. Helicopters, I've seen them make several emergency landings in this area. Although I understand we will probably have to chop out a taro patch to put a helicopter field in there, but yet the emergency pad right there - we need it .... We know the helicopter pad's got to go in there...we know that certain portions of this is going to have to be data recovered as you might be taking out a couple *lo'i* in order to actually put in the basic infrastructures that you need right there [RW].

I feel the loss of the Hawaiian things that can be kept; I don't see that we need to be over captured by *hula* and the modern *auwana* rather than the *kahiko*. I don't see why we have to go the "Hawaiian-Jamaican" style thing. But in Hā'ena, maybe I'm asking too much, I don't know of any of it can be totally recovered, but I think a lot of it could be. But I'd like to see a lot more respect for these places. You know the DLNR is supposedly in charge of all of these things, but I'd like to see a lot more respect from them. I would like to see them really working with the people who are trying to keep things going. Like maintaining the *heiau* there.... It's like the end of the road here, I hate to argue, but it would be great if they would close off the road, which I understand they have at the parking lot where the heliport is and let people walk in from there. It's a quarter of a mile at most. And then, 'Oh, you can't do that, people are not going to do it!' Well, if they really don't want to do it, then fine, let them turn around and go home! [FBW]

**Resource Structure.** One of the things, though, that this Plan doesn't show on it is there's a house in this area in here, which this guy Rusty used to live in this house long time ago. It's really really run down. I'm not sure if it's at the point where you could still salvage it or not, you might be able to, but I think this Plan is kind of completely absent on it...and there's a road that goes down to there. And I think it is an under-recognized resource because within the context of this Park and the cultural use of this Park, I think you're going to need to have places like that that are kind of like retreat centers where cultural groups could come...whether they stay there over night or not. But it's kind of like Kōke'e there's an outdoor education center up there and the nature center...I think having something like that in the Park here could be really important. Also the Hui Maka'āinana o Makana which has been the...we established a curatorship program with the State back in 1999 for the archaeological...primarily for the *lo'i* complex. It would be really good for them to have a place where they could have meetings and functions related to their curatorship of the cultural sites within the park. So that is something that I would like to see changed or enhanced on this plan [CW].

**Caretaker Structure.** Now things get dangerous. The nights...I know the idea of the full position of a caretaker and that particular house...probably thinking that closer to the entrance. The caretaker is a traditional part of our culture, to have the caretaker close in. Security twenty-four hours a day would be nice, although I'm hard pressed at this particular time to actually point at the type of vandalism one would expect right there. However, the presence 24/7 in the zone is really good [RW].

**Taylor Camp.** I'm not really comfortable with not including the beach area that's in front of Taylor Camp into the whole scope of the park. I think you're defeating the purpose in the Master Plan by only taking a tiny portion which is the actual end of the road, and ignoring three-quarters of the land footprint in the planning process [RW].

**Rockfall Liability Issue.** Addressing the liability issues, I don't think we're going to get into this particular point, but I do know that it's serious with the rockfalls...that a good section of the road that you're walking or driving, is right next to a cliff. Therefore, the suggestion of leading the paths out and away from the parking lot and towards the ocean and doing the loop and so it keeps people into more of the open plains rather than along the edge of the cliff. Although the traffic, whether it's going to be shuttle buses - whatever the nature of the concessions they have in mind, I'm not really sure of how they are going to be doing it, they're going to still be using the road as a footprint [RW].

Photo 76. Rockfall

**Park Concessions.** I know there's discussions on the different natures of concessions, but then again that's concessions whether it's neighborhood driven or beyond at this particular point - naturally the first choice would be within the *ahupua'a* of Ha'ena and then Waihi after that, and then expand out. I wouldn't mind seeing - I understand that the reason why SHPD, or being the State Parks, need the money that these parks can generate with the revenues, it would be nice for the first five years that fifty percent of the revenues stay in the park, after that then maybe twenty-five percent depending on the infrastructure. I think it's pretty reasonable to start the ball with expecting a hundred percent revenue to stay in the park. But some sort of arrangement as to a percentage based on years, either going up or going down over the years, needs to be discussed and broken down into the various - the methodology just in that alone, right! But to begin a discussion, I think fifty percent of it needs to stay or a certain length of time to allow some of the infrastructure to get settled in by the volunteer groups [RW].

#### 4.7.5 Park Volunteer Issues

I know in the past the volunteer groups have been a blight on State Parks in that they've done...they have not been hospitable to any volunteer group so far that is willing to work on the

State Parks. It's been a hostile environment and I can attest to that. I sure hope some of the attitudes are going to change. Diplomatic management of these volunteer groups is absolutely critical.... I've been working on *heiau*, on State *heiau*, for how long now and I'm still treated like an enemy although I've done nothing to deserve this treatment. It's difficult. And it's really hard for me to bring in the pillars of the community to work on these things in a hostile environment created by State Parks. So I think the attitude has to change. We all know State Parks is broke but then again, at the same time, the hatred for the really good people - I know there's monkeys in there - the monkeys run free but the good people who are following the rules are constantly stymied and life is a lot more difficult. That attitude has got to change; otherwise it's never going to work. And naturally everything starts from above; the premise of which State Parks embarks on this community cooperation is going to be very important - that the State government is willing to undertake a project that is culturally rooted. 'Cause in my experience it's what lasts a long time. If it is within the psyche of the Hawaiian culture, we as a community will buy it because this is the way we live our lives. You put in a western methodology into this; you're going to have problems because it's very short-sighted. And at the same time, everybody is one large family but we all have our different jobs too. So it becomes more of a larger collective, but I do know the importance of State Parks to have somebody who has the diplomatic skills, and the cultural knowledge and the historical knowledge in which to navigate this Hawaiian cultural psyche. We still live by the old ways in many respects. Our sense of hospitality hasn't changed one bit from the beginning of time. And we still carry on this hospitality to a very high degree, although a lot more difficult today to live because - these are the clashes of cultures. Generosity is considered a weakness but it isn't in the Hawaiian world. Generosity means wealth. There's room for many of the multi-disciplinary things, and I think that's the beauty and long range jewel that this park can have [RW].

**Permitting Process/Volunteer Issues.** The other one too, of course, which is the different varying jurisdictions that should be brought into one house. I think you have four or five different government jurisdictions here going on within the State Parks, consolidated into one. It would make it a lot easier in the permitting process which is essentially...the permitting process is what kills any volunteer activity in the end. It's just much too bureaucratic, much too time consuming as you go through all the different agencies. If you kept to one, I think, you'd be able to do things more on a timely basis. And it's the nature with volunteers that they're ready and willing to go right now, but to continually stand them down...you'll lose them. And then the momentum that comes out of communities are strong for a moment, they taper off for a little bit, they pick up again...it's like a tide...the tide comes in...the tide goes out. But it's a continuous process...while the tide is coming in then lots of activities are occurring [RW].

#### 4.7.6 Kapu Issue

I think you can get yourself confused with all the *kapu*. It all depends on your religious upbringing. Most of its Christian; those *kapu* are done by Christians...all Hawaiians, right. The Christians feared it, so the element of fear that permeates our culture has everything to do with that. That complete disassociation...you know, 'you touch heiau you're evil, you will die'. That's a Christian influence, that's not a Hawaiian influence. I have to preference here that the *kapu* here on Kaua'i is very different than it is on the Moku o Hawai'i. We have cookie-cut all Hawaiians into the Big Island/Hawaiian mode, and no such thing is the case here.

I think it's in page 97 in Bennett's, 'Archaeology of Kaua'i', goes into depth as he explains all the unique characteristics culturally, artistically, spiritually, and in our *kapu* - Kaua'i's cultural identity. And in it he clearly states that the *kapu* here was far more inclusive of all classes. The people sought the balance between male and female. The females were involved in war, they're involved in art, in the artistry and all aspects of it, and they're also involved in religion. The whole point of it was to seek the balance between male and female. There were not these European patriarch notions that people are so caught up with. No such thing here, clearly a lot more matriarchal, on this island. So our *kapu* are different. Essentially what it is, is that it is a reminder to men that they cannot bleed each other on royal sacred grounds. There is a place to fight and

there is a place where you cannot spill man blood. The spilling of man blood on a *heiau* is the most profane thing in the world. Somehow we've gotten all confused in thinking that because of women's *ma'i*, that's profane. But that's actually ridiculous, because they've lost sight of the real intent of it. Men cannot bleed on the *heiau*. And naturally having worked on it for so many years, every time somebody catches a little bleeder or stuff like that, I'm always very quick to get them off. Under my watch nobody bleeds on the *heiau*. They've gotten off as quickly as possible. It's fairly rare that it happens here, but still I'm always watching out for that. So there was far more of an effort to seek the balance between male and female here on Kaua'i. Those *kapu* did not exist that everybody seems to be so overly caught up in.

So ultimately this is how I see the world. This is how I see the way the culture blends, balances and moves in through all of that. Not exclusive, much more inclusive of all classes and people. I'm saying this because it's important to - there are so many *kapu* running around - everybody's got a *kapu* of everything. But the bottom line really is that in 1819 after the death of Kamehameha, all the references that I was aware of at that particular part by Hawaiians, it was always mentioned as the 'lifting of the *kapu*' - even Malo. You know Malo doesn't use the word "break" until way later, it's always 'the lifting of the *kapu*'. I think he says it really good, I think Edith McKenzie in the back of her book writes that particular letter, 'Due to the industriousness and the hard work of the *maka'ainana*, the privileges that were once Ali'i are now everyone's. The *kapu* was lifted.' They lifted the *kapu*, so show me any culture in the world that came to terms with forty years of foreign impact to their gods and said they no longer work we have to put them to bed. They actually put them to bed. They lifted the *kapu*. The breaking of the *kapu* is an early Christian attempt to make them feel better like they did it, but they didn't. And it's not so simple as Ka'ahumanu sitting down with Liholiho eating, that's just a gross simplification of what really happened. Yes, there were some diehards, but the *kapu* was lifted. So in that particular time all the *kapu* that was running around was lifted, and *ma'enoa*. Now in my mind it is up to us as a people, as we put back the *kapu*...but there is no real formal way and no real understanding by most people of just the fact that of the breaking of the *kapu* or lifting, just how much of a difference that really means. I'm saying this because I'm trying to explain my cultural viewpoint, of which I preface everything else on, of which I hand everything else on, on those basic premises. Seek the balance - far more inclusive of all cultures and class. The role of the male and female is clearly laid out in all of this, and we need to work a lot harder in reestablishing those [RW].

###

#### 4.8.0 Anecdotal Stories

##### 4.8.1 Kekela-Wichman House

I've got one story...another one of my spooky ones. My mother's house is just above... immediately above the house was the old 'around the island trail'. And when she first got the house, the house behind her as it turned out was built on this trail...lies the cookhouse, which was just the dining room and a kitchen. During the War the Army had taken over the house, and they'd gotten a whole bunch of beautiful stuff for the roof, only they put it on the floor instead of on the roof...so that everything from the floor up ...so my mother had to rebuild the house. And when she rebuilt it, she kept the cookhouse and turned it into two bedrooms. So that at one end you had a spring door that faced out towards the dry caves and a door between what was the kitchen and the old dining room and then a door leading out immediately to the house- you could go out either door or through. In my room - I took the old kitchen - that was about as far as you could get from everybody. I had my bed up against the window so that I could look out at the ocean. I kept having this feeling at night that people were walking past - you know that feeling - I thought I saw somebody out of the corner of my eye. I'm breaking my sleep all the time, so I moved the bed across the doorway to the dining room. And one night, I heard the screen door open and looked up to see who was there and nothing. But footsteps across the lauhala mat and I could see something stepping on to the mattress and footprints going down and I looked on the other side of me and somebody sitting on my chest, breathing on to my face. And then lifting off the weight, footsteps back to the floor, the door opens and shut and it open and shut again just a couple of minutes later.

I was really getting out of there. I never slept in that room again! I don't know what it was, but in the dining area my brother and sister-in-law put their oldest baby in there in the crib to get out of the way and the child would wake up just screaming and shortly after they'd put him down in there the baby would scream. After that incident mother just tore the place down - took both the kitchen and the dining room down because nobody would stay there. It was on the trail.

At her house she had several times somebody coming in and sprinkling salt and sprinkling around with ti leaves...there was just too much going on. But she was meant to be here... We were living in Lihue and she had gotten the place fixed up to move out - this was early '48 - the summer of '48. I don't know why we were supposed to wait for awhile, but everything was ready and about 9:00 that night, moonlit, my mother looked at me and said, 'Let's go.' 'Let's go out.' No problem for me so we got into the car and we came out. At that time you had to stop along the road at the bottom of the stone wall, so we stopped there and as she stepped out of the car. The sky had gotten overcast but as she stepped out of the car this little rectangle of moonlight appeared and she stepped into it and it followed her. She opened the gate and I'm following right behind her and never got into the moonlight and this moonlight took her to the door of the house. But she walked from the road all the way up into the house in moonlight and I did not. It was weird! But just as she got to the door, we heard a voice out on the balcony. ("Uuuu, Uuuuu") That was weird...I told her the next morning at breakfast, "Were you aware that you walked in moonlight and I didn't?" She wasn't aware of it; she just said that she's got immense feeling of being welcomed. What that was, I don't know! Somebody's saying, 'Welcome to the place' [FBW].

##### 4.8.2 Tsunami

I was 12 years old then. It was April Fools, April 1st, I was getting ready to go to school right before 7, and my brother was outside by the lanai, look down toward the corner, looking down, and he saw the water splashing on the coconut trees, right where the big white house, the football guy own now. Well it's kinda blocked by the fishtail farm that's why you couldn't see the house now, but anyway it's right close there in the Makua area. So we went down there, we went run down to the next place because the old man Hanohano and they all live right next to us below us, so we went go tell them about the boat and the net. We had the boat and the net down at the Rice's. So we all went down there. When we got down there, the water was receding but we never know what the hell was going on. We were busy unloading the net because it was full with water in the big boat so we unloaded the net and drying em. We didn't know what the hell was going happen. By that time, the channel was all empty with water. Then we looked outside the bay, we could see Namoku right in the center of the bay, kinda on the outside. And then the water was dropping off from there like \_\_\_. We still never think nothing. So we kept on doing the net. Until we heard the wreck sound up above us, the wreck sound, bulldozing all the house up by the Rice's. When we looked up, we saw the waves grinding, grinding, grinding all these houses that were up there because there were a bunch of em, coming toward us. That's when we started to run, we left everything, we ran in the corner, and just about that time the Rice's had the place graded with the bulldozer, so went bulldoze all the guava trees against the kamani trees, we call them, but anyway, yeh the false kamani trees, so we climbed on that rubbish pile that was about 15 feet, and climbing the trees, the two old men went climb on the rubbish, and they went hold on to the tree and the water went catch them over there. But we were up in the tree. So after the water went recede, the big haul that they had right down came right on the side of us because was open inlet. Because they went bulldoze everything and nothing could hold em back - right on the side of us. After the water went recede we ran home. By that time our house was against the pear tree and the plum trees in back of our place. We went home go look for my mom, call, call, call but the house was up against the trees. Call, call, but no more. Then we hear one faint soft calling us far up. So we went over the hill - we went follow the sound - we went over the hill because my sister she get that little hill eh, so we went right behind there, my mom was there all nude because her pajamas went all rip from the barbed wire, and she was pregnant with my brother. She was all scratched. So I went go home grab one sheet so I could wrap my mom, let her wrap herself, because she and Julia they were all bust up inside the lantana and barbed wire behind our house, but they were safe - all scratch up. By that time, before the second wave came, we was on our

way across the fence way in the back of us, you know where the \_\_\_ trail is? Below that there was a fence line, we went go climb on the fence line and swing across the place. That's kinda far you know, from here to in the back of my truck, I think that low in the back of the hill. So we went swing that part and we just got above that place, water came, sweeping down, by that time everybody was safe, we went climb on the hill to that Robinson's fence line and look down, there was no buildings, that YMCA was all flat. YMCA had about 8 cottages, and the theater and stuff was all flat, the stone theater over there was all flat and the kitchen, no more, all the roofs were all back against the hillside. So you can imagine how big that thing was. And then, we climbed further up, we look, all the hala trees were gone in back of the hillside. That's how that wave went wipe out all that hala because from the YMCA going to the Colony Resort that whole area was all hala trees, that's why they call that place Hala \_\_\_\_\_. 1946, the wave wiped that whole place out. But little bit been grow back, little bit. Most of the thing went smash, just like the wave went pound right on em, just like one bulldozer went right through that place. That's what happened.

In this area right here where the Rice place, that's where the water was coming down and we were over here and the wave went come around and wrap just like one back lash when we seen em pushing all these houses. But when we went run was one far run you know! We had to run fast because the wave was just coming down. They all flat - the water came from here and just like came this way. But actually when the water went reach here, this whole place here was all empty because here get the apapa, over here get the apapa - was dropping down from there. Over here was just like mountain, all the apapa was just like mountain, if the water was 40 feet, the mountain was standing 40 feet cut there. That's how it was - was spooky.

And then we seen em again in 1957 when we went run away when all this thing was taking place. We seen that, because we waiting for the waves come. It was 8 o'clock, quarter to 8, came that time. That was the estimated time...from the Aleutians down to our place. That was the time of the arrival of the wave, and we were watching that in 1957 ...and we never know what the hell would happen. We were watching from Keaumele ...right here this area. That's where the Wichman's are - Keaumele. Keaumele is right on that corner. Right in the back there we were standing up there and watching that[TH].

#### 4.8.3 Pohakupukane and Pohakuloa.

Pohakupukane stay on the hill. Pohakuloa stay right on the road right by the Wichman drive way, but stay covered with - you cannot see that because get sunflower growing right around em. It's right on the side of the road by the rubbish pile. That's Pohakuloa. And then the sister I don't know what the name - stay inside the water - someplace inside, out here somewhere, inside a puka someplace out here. Whether the thing is the same distance, I don't know. I just assuming that the place you know, like the distance from Pohakuloa to Pohakupukane, maybe the same distance for this in the water. You know the legend for that eh? Was something about she didn't wanna stay on the land by-and-by the bird would shit on her, and then the brothers told her oh if you going in the ocean, the eel and all the fish going live under you. She never care. Or something like that. But Pohakupukane I don't know. But actually they no belong here eh? These stones they come from Tahiti I hear. That's what the story was...you gotta look at the legend[TH].

#### 4.8.4 Lohiau Stone Wall

Just so that you know, you know where Lohi 'au's site is...that stone wall. My mother saved it. She was at home, right next door here. John Hanohano came to her and said that the County trucks were on their way to take the rocks from the [Lohi 'au] house site. So he took her down there and she walked in and just leaned against the wall. And they brought out the bulldozers and the trucks and all that kind of stuff, and she refused to move. She said, "You're going to take me first, before you touch one rock!" And she stood them off. And they finally called up Lihue and got some supervisor out here, who talked to her and turned around and ordered all the people to leave. "Leave it! Leave it alone!" But it was there, they had the bulldozers and everything to do it with [FBW].

## 5.0 SUMMARIES AND ASSESSMENTS

This cultural impact assessment is based on two guiding documents: Act 50 and OEQC Guidelines (see Appendices A and C).

**5.1.0 Act 50 State of Hawai'i 2000** H.B. NO. 2895 H.D.1 was passed by the 20<sup>th</sup> Legislature and approved by the Governor on April 26, 2000 as *Act 50*. The following excerpts illustrate the intent and mandates of this Act:

The legislature also finds that native Hawaiian culture plays a vital role in preserving and advancing the unique quality of life and the "aloha spirit" in Hawai'i. Articles IX and XII of the state constitution, other state laws, and the courts of the State impose on government agencies a duty to promote and protect cultural beliefs, practices, and resources of native Hawaiians as well as other ethnic groups.

Moreover, the past failure to require native Hawaiian cultural impact assessments has resulted in the loss and destruction of many important cultural resources and has interfered with the exercise of native Hawaiian culture. The legislature further finds that due consideration of the effects of human activities on native Hawaiian culture and the exercise thereof is necessary to ensure the continued existence, development, and exercise of native Hawaiian culture.

The purpose of this Act is to: (1) Require that environmental impact statements include the disclosure of the effects of a proposed action on the cultural practices of the community and State; and (2) Amend the definition of "significant effect" to include adverse effects on cultural practices.

### 5.2.0 Summary of Findings

The following summaries are based on the information presented in the previous sections: the traditional and historical literature review in Section 3.0 and the ethnographic data and analyses in Section 4.0. References are not cited here unless it is new information and not already cited in the text above. These summaries condense the information above, but also serve to focus on a few significant individuals and events in Kaua'i's history in relation to the *ahupua'a* of Hā'ena in the traditional *moku* of Halele'a.

#### 5.2.1 Summary of Significant People and Events: Project Area or Vicinity

##### 5.2.1.1 Ancient or Mythical People

Hā'ena figures significantly in the legends of Hawai'i volcano goddess Pele and her sister Hi'iakaikapoliopole (Hi'iaka). Pele falls in love with the local chief Lohi'au and requests that her sister go to Kaua'i to bring him back to Hawai'i Island. The house ruins of Lohi'au still exists in Hā'ena today, as does the hula platform associated with him, where he paid tribute to Laka. What is not clear, is when, in relation to the ali'i below, Pele, Hi'iaka and Lohi'au are in Hā'ena. Other people during this period are Lohi'au's sister Kahuanui, his friend and companion Pā'oa, the Piliwale sisters, a *kupua* named Kapalae and mo'o wahine Kilioe and Kalanamainu'u who guarded the spirit body of Lohi'au in the cave and fought with Hi'iaka and her companion Wahine'ōma'o when they tried to take his spirit body.

The Menehune are said to be legendary as well, yet they appear to be a very real part of Kaua'i's history and said to have finally left the island from Hā'ena, as did the subsequent Mai'a people who were also connected to the early people of Kaua'i.

### 5.2.1.2 Significant Ancient Events

The significant ancient events connected to the project area (vicinity) include the origin of the *hula* -- the *hula halau* or school that included use of the lands of Kēʻē for practices, ceremonies and habitation; the spirit visit of Pele where she follows the sounds of the *hula* drum to Kēʻē, and manifested as a beautiful woman whom Lohiʻau fell in love with; the visit by Hiʻiaka sent by Pele to fetch Lohiʻau who had died of a broken heart when Pele left Kēʻē, and the exodus of the Menehune and the Maiʻa. Other than Lohiʻauʻs house, the *hula* platform (*Ke Ahi A Laka*) and the heiau (*Ka Ulu o Paoa*), any evidence on the landscape connected to these events within the project area was most likely destroyed over time by both natural (storms surges, tsunami) and human means.

### 5.2.1.3 Aliʻi nui

Kauaʻi was first settled by descendants of Kumu -honua and Lalo -honua -- thirty-six generations before Papa was born. Chief Ka-māwae-lua-lani-moku traveled to Kauaʻi with his wife, Kahiki -lau-lani, and her two paddlers Kō-nihinihi and Kō-nahenahe. Because of his good deeds, the great number of his descendants, and the prosperity of his reign, people began to call this island Kauaʻi-aʻi (*Place of Abundance*). Then a few generations after Papa and Wakea (second son of Kahiko and Kū-pūlana-kehau) and also well before the descendants of Nanaʻulu came to Kauaʻi from the south of Hawaiʻi around the 6<sup>th</sup> century along with other families from Tahiti or Samoa who brought their Polynesian traditions, a voyaging canoe commanded by Kūʻalu-nui-kini-akua landed on the west shores of Kauaʻi, at the mouth of the Waimea River. His counselor named Piʻi -ʻaliʻi came with him. They settled in Waimea along its bountiful river and surrounding valleys. Over time they expanded into nearby canyons, valleys and coasts, from Nāpali to Kōloa. Kūʻalu-nui-paukū-mokumoku followed his father as leader of the people of Kona, Kauaʻi and it was during his reign that he sent for a group of people called *Menehune* from his homeland. They helped to construct *heiau*, fishponds and irrigation systems for raising taro. His son Ola was responsible for having the *Menehune* construct the ditches of Pali-uli.

Over time other settlers inhabited all the Hawaiian Islands. Many genealogies of Hawaiian *aliʻi* indicate that Nanaʻulu and ʻUlu (ca A. D. 830) were prominent ancient ancestors who settled all over the Pacific Islands. Around A.D. 1090 Puna -nui-ka-ʻāina arrived on Kauaʻi, said to have come from the Marquesas Islands. Puna-nui-ka-ʻāina arrived when the chief with the deadly riddles, Ka-iki-paʻa-nānea, was ruler of Waimea. Puanui chose to settle along the banks of the Wailua River and this land came to be called Puna. This was the beginning of two chiefdoms on Kauaʻi; Puna in the east, and Kona on the west.

Marriages between chiefly families on all islands are very common as families and alliances are strengthened. During the 1300s the Kona chiefdom is defeated by the Puna chiefdom. Moʻikeha arrives on Kauaʻi and enters a contest which he wins; his prize is the daughter of the Puna chief. His father-in-law orders the construction of Holoholokū (birthing stones of Wailua), for the birth of Moikehaʻs children. Moʻikeha became the first aliʻi aimoku of Kauaʻi. When Moʻikeha passed away his bones were kept in Kēʻē, at the end of the road for safe keeping, until Laʻamaikahikiʻs return.

Early in the 1400s the two chiefdoms were united during the reign of Kūkona, father of Mano-ka-lani-pō and Palekaluhi. Mano-ka-lani-pō married Nae-kapu-lani, the daughter of Kauaʻi Kona chief Makaliʻi-nui-ku-a-ka-wai-ea. During the reign of Kūkona, Hawaiʻi Island chief Ka-lau-nui-o-Hua defeated Maui chief Ka-malu-o-Hua, Molokaʻi chief Ka-haku-o-Hua, and Oʻahu chief Hua-i-pou-leilei [their names imply they were related] and set out with his hostage chiefs to Kauaʻi where he planned to defeat Kūkona. However, Ka-lau-nui-o-Hua was in turn defeated by Kūkona. The hostages were set free after promising never to attack Kauaʻi again; the Hawaiʻi chief remained a prisoner for a while, but he too was later freed.

With Kauaʻi kingdoms united, the new royal residence was set up at Wailua, but Waimea remained significant. It was during the reign of Mano-ka-lani-pō that Kauaʻi prospered during its Golden Age; this was the period of fishponds and monumental *heiau* and complex irrigated *loʻi* or pond fields. This continued on to the mid -1500s and mid-1600s; this was also the beginning of the Kawelo line of *aliʻi nui* on Kauaʻi.

Oʻahu *aliʻi nui* Kū-aliʻi was a descendant of the Kawelo line on his grandmotherʻs side. During the battles of the Kawelo cousins Kawelo -lei-makua (Kawelo) and Kawelo -ʻAikanaka (ʻAikanaka) in the late 1600s, Kawelo ceded Kauaʻi to Kū-aliʻi if they should both die. Kawelo defeated the forces of ʻAikanaka who escaped and hid in a cave. He was later found and supposedly thrown off the cliffs of Hanapēpē. However, Kawelo was also supposedly thrown off the cliff as well by his warriors who were afraid he was going crazy. Kū-aliʻi came to Kauaʻi and declared himself the ruling chief and installed his son Pele -iʻō-hōlani as governor. After Kū-aliʻi died in Kailua, Oʻahu in A.D. 1730, Pele -iʻō-hōlani left Kauaʻi to become the ruling chief of Oʻahu. He left his daughter Kaʻapuwai as governor of Kauaʻi.

Kaʻapuwai died before Pele -iʻō-hōlani so the government of Kauaʻi passed to Ka -maka-helei who owed allegiance to her grandfather Pele -iʻō-hōlani. She married Kiha, a Kauaʻi chief, and had three children: a daughter, Lele-māhoa-lani, a son, Keawe, and another daughter, Ka -lau-i-pihana. Pele -iʻō-hōlani sent his grandson Ka-neoneo to Kauaʻi to ensure the island would remain loyal to him. Ka -neoneo and Ka-maka-helei were first cousins and Ka -maka-helei set Kiha aside and took Ka-neoneo for her husband.

During this time, Maui ruling chief Kahekili won several skirmishes with Pele -iʻō-hōlani who then sent for Ka-neoneo to help him on Oʻahu. This left Ka -maka-helei vulnerable. Kahekili took advantage of this and sent his half -brother Kaʻeo-kūlani to Kauaʻi to woo Ka-maka-helei; she married Kaʻeo and they later had Ka-umu-aliʻi, who was to become the last ruling chief of Kauaʻi.

### 5.2.1.4 Ancient Practices

Changes occurred during 1300-1600s that brought about a uniquely Hawaiian culture, documented by the material culture found in archaeological sites. Kauaʻi developed a unique form of poi pounder such as *pōhaku kuʻi poi* (ring and stirrup pounders), double -grooved stone club heads, and a broad anvil *kapa* beater. The early culture evolved as the population grew, and many of the changes were related to significant socio-economic changes.

There are several ancient practices connected to the project area and vicinity. As stated above, the *hula* was an ancient practice connected to Kēʻē, and greater Hāʻena, as were the ancient practices of fishing, fishpond aquaculture, taro cultivation, sand dune burials and cave burials. Lohiʻau was said to be buried in a cave until retrieved by Hiʻiaka and the bones of Moʻikeha were buried in Kēʻē until Laʻamaikahiki returned to collect them and take them to Kahiki. Ancient *ʻiwi* (bones) are still in Kēʻē sand dunes although relative dating has not been done of their vicinity. Ancient voyaging practices can also be implied to be connected to the area because, according to the *moʻolelo*, the Menehune and Maiʻa departed from Hāʻena to sail back to their homelands. And the ancient ceremony of throwing fire brands (*ʻōahi*) off the mountain was performed at the top of Mauna Makana - the project area is located at the northern base of this mountain.

### 5.2.1.5 Historic People

One of the first significant historic people to land on Kauaʻi shores was Captain James Cook who landed at the mouth of Waimea River, the same place as Kauaʻiʻs first legendary Polynesian settlers, centuries before. His contact with the people of Kauaʻi would have far reaching and devastating effects. Cook gave Ka-maka-helei and Kaʻeo and others gifts, including goats, sheep and a new breed of pig. Cookʻs

men also gave the people of Kaua'i venereal disease. Many more foreign ships made contact with the island people of Kaua'i; some stayed and became residents. In 1820, the first missionaries landed in Hawai'i; they brought Humehume back with them. He was the oldest son of Kaumu'ali'i, who had been sent by his father to the mainland to obtain an education. Since he had not been heard from in years, it was assumed that he was dead. Kaumu'ali'i later converted and gave the missionaries lands to build a church and school.

Kaumuali'i was later coerced into ceding Kaua'i to Kamehameha I who had conquered the other island kingdoms, but Kaumu'ali'i was allowed to continue to rule Kaua'i. A couple of years after the death of Kamehameha I, his son and heir Liholiho (Kamehameha II) visited his cousin Kaumuali'i on Kaua'i. Kaumuali'i was subsequently "kidnapped" by Liholiho and taken to O'ahu, never to return to Kaua'i or to his family. He was also coerced into marrying his cousin Ka'ahumanu, former queen of Kamehameha I and *kuhina nui* or regent to Liholiho. Kaumuali'i died a few years later.

During the reign of Kamehameha III, lands were assigned to and claimed by lesser chiefs and *konohiki* in what was called *The Great Mahele* (ca. AD 1846-1856). The lands of Hā'ena with the exception of *kuleana* lands, were awarded to Abner Pākī, grandson of Maui mo'i Kamehameha Nui (older brother of Kahekili and Ka'e'o), father of Princess Bernice Pauahi Bishop and cousin of Ka'umu'ali'i. Pākī's *konohiki* was E. Kekela, sister of Pākī's mother, and wife of half-brother of Kamehameha I. After her husband's death, she became the wife of Kamaholelani, ohana of Kau'muali'i. After Pākī's death (1855) the lands went to his daughter Princess Pauahi. In 1858 Princess Pauahi sold her Hā'ena lands to W. H. Pease.

#### 5.2.1.6 Historic Events

Historic events connected to Hā'ena would have included the awarding of the ahupua'a to Abner Pākī, which were managed by his aunt and *konohiki* Kekela; the visit by Hawai'i Island *ali'i* Moku'ohai who claimed lands at Hā'ena. The awarding of *kuleana* lands to Haole (#7998 - 'Ili of Kē'ē) by Moku'ohai in 1846, formerly cultivated by Ho'oleali'i; Kanehakili (#7996 - 'Ili of Kapihae) by Kekela in 1839; Nanahu (#8200B 'Ili of Naia, located between Loko Naia and Loko Kē'ē); Moku'ohai (#8200C/RP #7091 - 'Ili of Kē'ē /Naia) by Kekela in 1840 and 1844 (his grandchild and heir Kaenaku inherited it); Naiwa (#10941/RP #6388 - 'Ili of Kamookhalu) by *konohiki* pre-839 and Kekela in 1839; Pea (#10675 - 'Ili of Pa'akala) a tenant during pre-Kekela. After the death of W.H. Pease (1866) his lands were purchased by William H. Kinney (1872); and in 1875, Hā'ena was conveyed to Hui Kū'ai 'Āina o Hā'ena (Andrade 2008:99).

#### 5.3.0 Summary of Interviewee Concerns/Mana'o

- ❖ The lower slope of the dunes had houses/hale...artifacts found when Mo and Alan did their inventory survey.
- ❖ Hā'ena is really old and any loss is significant...this is well-known.
- ❖ The age of the settlement is significant; the Menhune and Mu/Mai'a people left for their homeland from Kē'ē Beach as this was the doorway out...the safety area of Nāpali. It's [Hā'ena/Kē'ē] old...should get archaeological carbon dating; would be significant to know.
- ❖ I would think if I were a *kumu hula* to one of the most famous *hula halau* areas is some place that I could actually get to with my crew [students]...would be something I'd want to do. And a few have done it in the past. But it's too dangerous right now. And too many people are going into it and lifting stones, and taking stones .... To me I think it should be cleaned up because when it's overgrown, the way it is now, the roots ... the trees and stuff...they're busting up all the rock

walls. In my opinion, they're desecrating it. The challenge is that when you clean it all off, then all the tourists are going to want to go up there. So how do you control...it's always a two-edged sword...that kind of thing.

- ❖ The Lohi'au is another one. It's overgrown its right by the trail head. It's an area that kind of needs to be cleaned up. I think it would be great to have it cleaned up and have better interpretive materials.
- ❖ The Lohi'au house site is poorly mapped...other things are not mapped.
- ❖ The road is actually coming way too close to it [Lohi'au site]. The car bumper is almost touching the thing...so you need to put a larger buffer around that.... A larger buffer needs to be established around the Lohi'au house site
- ❖ In order for us to do the turn-around areas you're in the most sensitive of the burial areas. As you start to get that footprint between the Lohi'au house site and the bath room you have a very tiny maneuvering room right there and also, quite frankly, problematic
- ❖ Although we know we're dealing with a sacred area, there are certain sectors that are clearly more sacred than others. The pathway in which the human traffic is going through is absolutely critical that it goes around features not too close and not too far, and without going through any of the walls. So there is a sensitive approach that you really need to put the overall paths in there. Because anybody who has any understanding of Hawaiiana and they see the path not properly placed within the landscape, will cause problems. But I think in that sensitivity right there...right from the get-go will help things a great deal
- ❖ The whole Park needs interpretive materials, it's really lacking, and it's one reason that most of the people come there. They just think it's a place to go swimming or lie on the beach, or throw their rubbish away in the bushes. They don't understand that in the ancient days this was like one of the Seven Wonders of the World with the 'Ōhō ceremony and the heiau...this was a very special sacred area that in ancient days people made pilgrimages to come here.
- ❖ I think it's pretty ridiculous to even assume that one group can handle all aspects of this...so there's room for different groups...their *kuleana* are very separate, but yet all of them are focused and the goals are all the same.
- ❖ The wetland is there already – breathing...no need to convert anything; no need to clean it up; there will be a problem if effluence is pumped into the wetland....
- ❖ Comfort Station/Wetlands is really rich culturally; if they trench for a septic system it will go through quite a bit.
- ❖ The existing [CS] footprint right now needs to stay, but still close within it are the preserves - we have burials that are right in there, below and around the bathroom area.
- ❖ Sewage draining [into "wetlands"] is serious stuff; it will punch through the cultural layers to the burials...this will be highly contentious with the Hā'ena group...they all know about the burials and cultural layers.
- ❖ Comfort Station [is]...at edge of the fishpond...10-15 feet, plus right on water table
- ❖ What this Plans shows...and maybe this is another concern...it shows the 'auwai being restored and running through the parking lot. While that might sound good, the problem would be drainage and what's going to happen with all the runoff from this paved parking lot, assuming it's paved, maybe there's other ways to deal with it. But if you got all kinds of oil and brake fluid, dust, asbestos dust from brake pads...washing in to the 'auwai from the parking lot...that would have

- hundreds of cars a day parked in it...it could be really bad for the health....I mean you're talking about food production
- ❖ We just came back from Kē'ē, we had a grave site in Kē'ē, right near the sand dunes. I can't even recognize all that today. Ka'ilio nui yes, all around there. I guess that's old grave sites, because you folks remember sometimes when a big wave or *nalu*, you could see the skeleton s.... I remember walking down, going down Kē'ē, pass Ka'ilio nui and then all these skeletons on the beach.
  - ❖ Having a trail that actually loops around the ocean front and actually makes a full circle from the internal parking lot, which we know is going to have to be expanded and is not enough
  - ❖ I'd say probably the only thing that, maybe, I would have a concern with in here would be the level of recreational use. I'm trying to remember, I think there were bike paths and stuff like that. I think people need to have access throughout the park, I'm not sure that we gotta necessarily have bike paths throughout the park. I'd say that's just something we'd probably want to re-look at...the location of those paths and access ways.
  - ❖ How you're going to transfer everybody from the parking lots...quite the distance. I don't know if it's 300 or 400 yards or more - quite a bit more than that between the parking lot - it's a long walk for people.
  - ❖ The location of the base yard...I think once they have a little bit better of the footprint in mind, we need to take a better look at it. They are pretty close to a cliff line right there, and they're on the high side.
  - ❖ Although I understand we will probably have to chop out a taro patch to put a helicopter field in there, but yet the emergency pad right there - we need it.... We know the helicopter pad's got to go in there...we know that certain portions of this is going to have to be data recovered as you might be taking out a couple *lo'i* in order to actually put in the basic infrastructures that you need right there.
  - ❖ The toll booth thing and exactly the placement and how that's going to happen, that's still yet to come.
  - ❖ I'd like to see a lot more respect for these places. You know the DLNR is supposedly in charge of all of these things, but I'd like to see a lot more respect from them. I would like to see them really working with the people who are trying to keep things going. Like maintaining the *heiau* there.
  - ❖ It's like the end of the road here, I hate to argue, but it would be great if they would close off the road, which I understand they have - at the parking lot where the heliport is and let people walk in from there. It's a quarter of a mile at most. And then, 'Oh, you can't do that, people are not going to do it!' Well, if they really don't want to do it, then fine, let them turn around and go home!
  - ❖ In the past the volunteer groups have been a blight on State Parks in that they've done...they have not been hospitable to any volunteer group so far that is willing to work on the State Parks. It's been a hostile environment and I can attest to that. I sure hope some of the attitudes are going to change. Diplomatic management of these volunteer groups is absolutely critical.... The premise of which State Parks embarks on this community cooperation is going to be very important - that the State government is willing to undertake a project that is culturally rooted.... You put in a western methodology into this; you're going to have problems because it's very short-sighted.
  - ❖ I do know the importance of State Parks to have somebody who has the diplomatic skills and the cultural knowledge and the historical knowledge in which to navigate this Hawaiian cultural psyche. We still live by the old ways in many respects. Our sense of hospitality hasn't changed one bit from the beginning of time. And we still carry on this hospitality to a very high degree,

although a lot more difficult today to live because - these are the clashes of cultures. Generosity is considered a weakness but it isn't in the Hawaiian world. Generosity means wealth. There's room for many of the multi-disciplinary things, and I think that's the beauty and long range jewel that this Park can have.

#### 5.4.0 Guideline Criteria in Relation to Project Lands

According to the State of Hawai'i Environmental Council Guidelines, the types of cultural resources, practices and beliefs subject to assessment may include subsistence, commercial, residential, agricultural, access-related, recreational, religious and spiritual customs.

#### 5.4.1 Cultural Practices/Resources in Project Area

There were/are several cultural resources and cultural practices in the Hā'ena State Park lands as indicated below:

| Cultural Resources | Cultural Practice                  | Continuing Practice/Use         |
|--------------------|------------------------------------|---------------------------------|
| Ka-Ulu-O-Paoa      | ceremony/ritual                    | ho'okupu <i>wahi pana</i>       |
| Ka-Ahu-O-Laka      | hula/uniki                         | ho'okupu/hula/ <i>wahi pana</i> |
| Lohi'au Complex    | house site/misc                    | <i>mo'olelo/wahi pana</i>       |
| Sand Dune Burials  | burials                            | <i>wahi pana</i>                |
| Loko Kē'ē/Naiia    | aquaculture/ <i>ali'i</i> resource | want restoration                |
| Taro <i>Lo'i</i>   | food resource                      | some restored/more wanted       |
| 'Auwai System      | Agriculture irrigation system      | modified/in use                 |
| Pu'u Makana        | 'Ōahi Ceremony/Practice            | <i>mo'olelo/wahi pana</i>       |
| Waiakapala Cave    | Sacred Waters of Kānaloa           | <i>wahi pana/healing waters</i> |
| Waiakapala'e Cave  | Mo'o mo'olelo                      | <i>mo'olelo/wahi pana</i>       |
| Kalalau Trail      | <i>huaka'i</i>                     | access trail                    |
| Kē'ē Beach Trail   | ceremonial                         | access trail to <i>hula pā</i>  |
| Limahuli Stream    | multi-practices                    | multi-uses                      |
| Kē'ē Beach         | multi-practices                    | multi-uses                      |

#### 5.5.0 Cultural Impact Assessment

##### 5.5.1 Cultural Resources

This category entails sites or places associated with significant events and/or people important to the native Hawaiian patterns of prehistory; embody distinctive characteristics; or are likely to yield information important for research on the prehistory of Hawai'i. It also includes sites that yield resources important for native Hawaiian Cultural Practices, past and present; and items that are part of a cultural context. *Wahi Pana* or sacred places are important cultural resources to native Hawaiians regardless that the original sites that may have been there no longer exist.

The project lands were once a part of an ancient Hawaiian *ahupua'a* life-system as well as a support system for the *ali'i* who lived there and the *hula halau*. The physical evidence of multi-use ancient or traditional cultural practices still exists (e.g. Lohi'au's *hale*, *hula* platform, *heiau*, fishponds and *lo'i*), which not only indicate traditional land-use of the area, but that it (Kē'ē) was/is considered a *wahi pana*. The evidence also indicates that Hā'ena was not only well established, but part of ancient Hawaiian life-systems that included the traditional gods, goddesses, other significant deities, *ali'i nui*, officiating *kahuna* and people who lived and cared for the land. The *hale* or house complex of Lohi'au confirms that portions of Hā'ena were *ali'i* lands with all the necessary traditional infrastructure and required support

systems. According to several sources, there are burial grounds for ancient as well as historic Hawaiians. The project area also included fishponds, considered resource/property of the *ali'i nui* and an extensive taro *lo'i* - *'auwai* system with documented *ko'ele* or taro patches set aside for *ali'i nui*.

## 5.5.2 Cultural Practices

This category includes items that are essential to the practices that have cultural value to either native Hawaiians or other ethnic groups. Burials are considered a very significant cultural practice and both cave and sand dune burials are located within the project lands. The whole area of Kē'ē, Hā'ena, was once part of the original *hula halau* connected to Laka, and honored by Hā'ena *ali'i nui* Lohi'au whose *hale* or house is located at the base of Pu'u Makana, to current *kumu hula*. Other traditional practices included *'ōahi* (firebrand throwing), crop cultivation (e.g. taro, sweet potato and banana), salt water and stream fishing, marine gathering (e.g. seaweed or *limu*, limpets or *'opihi*, *wana*, *he'e* or octopus and sea cucumber), stream gathering of crayfish and *kupe'e*, forest gathering of medicinal plants, food plants and craft plants. Many of these latter practices continue to today.

## 5.5.3 Historic Resources

This category entails sites associated with significant events and/or people important to the broad patterns of history [post Western contact], which includes other ethnic groups; embodies distinctive characteristics of an historic era or master; or are likely to yield information important for research on the history of Hawai'i. There are historic burials within the project lands, but while people are no longer being buried there, their families continue to honor them, a filial practice that has been continuous. The poi mill foundation is all that exists of a historic cultural practice, however, some of the Hā'ena people would like to see it restored to be used in conjunction with ancient and historic taro *lo'i* that have been restored and re-cultivated within the last twelve years. The ancient fishponds were also used in historic times, but often modified to include non-traditional species such as introduced fish, ducks and rice. And although both Kē'ē fishponds were discontinued years ago, some Hā'ena people would like to see them restored and utilized again as a community food and education resource.

## 5.6.0 Summary of Cultural Impact Assessment/Recommendations

### 5.6.1 Cultural Resources (Land, Water and Marine) Impact

The lands within Hā'ena State Park were impacted by natural and human activities of the 19<sup>th</sup>, 20<sup>th</sup> and 21<sup>st</sup> centuries. However, many cultural resources still exist as indicated above and many are associated with cultural practices that continue today. The Hā'ena State Park Master Plan should include preservation plans for the cultural resources, burial treatment plans for ancient and historic burials, interpretive plans, and cultural access strategies.

### 5.6.2 Cultural Practices/Access (Land) Impact

While there haven't been any recent (continuing) burials in the project area or functioning use of the fishpond, according to some of the consultants, traditional/ancient sand dune burials may be impacted by any modifications to the vicinity; lack of beach trail maintenance will impact cultural access to the *hula pā* for *hula halau*; and traditional unrestored *lo'i* may be impacted by the creation of permanent parking lots or helipads in the old *lo'i* areas. Therefore the Hā'ena State Park Master Plan should include strategies to keep current trails clear; to create culturally sensitive trails and buffers to ancient burial grounds; and to protect unrestored *lo'i kalo*, *'auwai* and fishponds.

### 5.6.3 Historic Resources (Land) Impact

This category overlaps Cultural Resources in that sand dune burials continued into the historic period, as did the use of fish ponds, taro *lo'i*, *'auwai* systems, *hula pā* and Kalalau trail. While some of these resources may have been damaged by historic tsunami, they still qualify as historic resources (religious/spiritual and subsistence example). There are a number of historic burial plots framed by concrete or other markers within Hā'ena State Park and remnants of a historic poi mill. There are also at least two historic structures (wooden houses) located in Hā'ena State Park or immediate vicinity that could be considered "historic" (over 50 years). The Hā'ena State Park Master Plan should include preservation plans to protect historic burials and provide access for families; the two historic wooden should be assessed on their integrity and possible future uses.

### 5.5.4 Historic Practices (Land and Water) Impact

The historic practice of sand dune burials was discontinued; the historic use of the fishpond aquaculture was also discontinued in Hā'ena. The restoration and continued practice of growing *kalo* (taro) has been revitalized in recent years in Hā'ena State Park and elsewhere in Hawai'i. Fishpond aquaculture has also been revitalized around Hawai'i and there is some hope that this will happen in Hā'ena State Park as well, for subsistence and cultural purposes. Several marine cultural practices continue today with some modifications. Limited fishing continues although hampered somewhat by the extensive use of the visiting tourist who use the beaches and snorkel in the protected Kē'ē lagoon. Use of the reef is discouraged so there is little likelihood of *limu* gathering there, although limited gathering of *'opihi* may still continue on shore-line.

## 5.7.0 Interviewees Master Plan Recommendations

When the ethnographic survey for the Master Plan/EIS CIA was conducted, the Comfort Station was already in the very early stages of construction however, modifications for the Wetlands had not started. While a limited number of people were interviewed, they shared their many concerns regarding Hā'ena State Park and a long list of recommendations for the Hā'ena State Park Master Plan, which are re-capped below.

- ❖ **Restore/Use Cultural Sites** One of my dreams with this park here down at the end of the road. I would love to see the *halau*, the *hula halau* area, and *Ka Ulu o Paoo* -- I'd like to see it restored and used. My idea was over by the parking lot put in some sort of a building so that any *hula halau* in the State can perform on the *halau* platform with the understanding that they put on a program for the public which would be taped and begin a *hula* historical record -- a depository -- so that these things that are so ephemeral are not completely lost... I think you could end up with something that would be for a nonprofit organization running that sort of thing. And then, of course, you'd have a source of income being able to charge something to go to the performance. The *halau*, in order to be able to use the place, the actual school, would be, I think, somewhat of a good thing.... To me the only way you're going to save this, is to use it...to me that should be directed to the practitioner's who use that [*hula* platform mad *heiau*].
- ❖ A larger buffer needs to be established around the Lohi'au house site
- ❖ **Special Use Cultural Park** I think the Master Plan has to address ways of protecting cultural areas from just being considered public domain. The whole western [mentality] is so... "It's a State park and I'm a U.S. citizen, then I should be allowed to go anywhere I want in the State." That's not how this Park should be operating. But I do think it would be ...it [*hula pā/heiau*] should be better maintained...it should be cleaned and better maintained - it's a really impressive site.
- ❖ **Interpretation** The whole Park needs interpretive materials, it's really lacking.

- ❖ **Sand Dune Field School** Maybe open the [project area sand dunes] area for field school...it's a rich eco-system.
- ❖ **Multi-Disciplinary Approach** I think that my main point is that some of the cultural methods that you may want to consider in this whole thing. Number One, this is multidisciplinary.
- ❖ **Archaeology Preserve** This area [the park] should be reserved as an archaeological preserve and so therefore, for educational purposes, archaeology should be allowed, but that's separate in its own particular field.
- ❖ **Fishing House.** You have the fishing, so another house is controlling [fishing] - their only duty is to manage the fisheries of Hā'ena.... At this particular point I'm not going to put in any individual, I could say that, for example, Jeff Chandler, he's a fisherman. He has a great deal of knowledge that could be added to the world of fishing. For example, he would definitely be in the House of the Fisherman. His ideas and his participation in the fisheries, conferences and meetings, and everything like that, along with Thomas Hashimoto, they know what to do in regard to managing the fishing resources. I think he would be really good with that
- ❖ These can also end up being working fishponds too and so that could be another aspect under the fisheries in not only managing the kai fisheries but the wai fisheries also. So those are there as far as expansion capabilities. It would be nice to have it as a larger Master Plan ....and step by step work up to it
- ❖ **Marine Biology House** Another house is going to be Marine Biology, which is the study of reefs, that needs to go on.
- ❖ **Taro House** Another house would be the taro, such as Hui Maka'ainana, which is the taro growing aspects of it right there.
- ❖ **Lo'i Expansion/Water Supply** We may want to take another look at the water supply Hui Maka'ainana expanding their footprint. Right now the last time I saw it there were four big *lo'i*, however I know that Thomas Hashimoto had two or three other *lo'i* in the areas...and I know he wanted to open up too. So I think in visioning a larger Master Plan for the actual footprint that Hui Maka'ainana can expand their *lo'i*, with the foot-trails that are coming through there...that we keep it pretty safe...the terrain itself is not necessarily really difficult; although slightly undulating, the view plains through here are absolutely stunning.
- ❖ **Botany House** A lot of this stuff in here - the vegetation is *kamani* - there's a botany aspect to it too, so that's a separate house too. There's a whole la'au lapa'au aspect that could be done here too, which actually creates a whole another separate house of botany....again, a completely different discipline, and under different goals and objectives, but still important to the big picture
- ❖ **Protocol House** Then another house will be the house that actually is the *heiau* itself.... The group that would handle all the protocols and everything with the *heiau* that's different, that needs to be a specialized group...a specialized *kahuna pule* - the house itself - the protocols that need to go on in the *heiau* and all the activities need to be overseen by some very experienced people
- ❖ **Mason House** We were able to do that in the new Loko Kai restoration Project, in that we created the Mason House in all the restoration work. The Mason House included both males and females. It was their job to decide how the stone walls were going to be built. Once they knew exactly what they were going to do, then they told the Kahuna Pule House, and then they're the ones who decided how to open the door...keep it open...keep everyone spiritually safe...and close the door after we're done. It was their job to protect the masons while they're working. The Third House was the Nā Pali Coast Ohana which both the masons and the Kahuna Pule knew exactly what to

do, and then it was our job that both of them got exactly what they needed whenever they needed it.

- ❖ **State Parks House.** The Fourth House was State Parks, which oversaw the whole thing to begin with. In the long run that methodology really helped focus the work and the energy. It kept people from being in too many places...and into discussions where they don't really belong. It facilitated things in the long run much better and made for a strong more cohesive unit
- ❖ **Fundamental Groundwork** Number two, the cultural, educational, spiritual, philosophical reserve or preserve where all of that [the various Houses and their *kuleana*] is perpetuated. So there's a unique opportunity by laying the fundamental groundwork for the separation yet the unification of these separate houses. I think it would be well worth considering over a long range period. It keeps the arguments and everybody focused on their job, instead of one guy who is in every single camp, this just doesn't work in the long run.
- ❖ **Cultural Methodology** The main point...is to consider the culture methodology and the way you organize the different disciplines. I think it's going to help a great deal in the end.... Our cultural methodology and problem solving and work ties everyone together, keeps everyone focused, keeps the arguments, keeps everybody out of each other's hair, keeps everybody out of where they do not belong, but also gives everybody a sense of responsibility and a place - a sense of importance and a sense of a very specific responsibility. People need this to grow, but at the same time it's symbiotic, if we don't seek the symbiotic relationships we're not following the lessons we're supposed to.
- ❖ **Ceremony/Cultural Protocols** The cultural protocols that demand this particular approach just because of the site you're dealing with. You're dealing with one of the most important religious, cultural, historical centers. Our ancestors deserve the best. Naturally when you're dealing with these elements it is much safer to be operating on a much higher elevation of ethics and protocols. And in the long run it's much safer for everyone. But at the same time it ends up as a spiritual experience because in the end it is a ceremony that binds us together. Now once we've experienced the ceremony together we have something in common. So the ceremony is actually critical. As far as I'm concerned, the more ceremonies that go on up there the better, but that elevated protocol is critical in keeping everyone safe and respectful
- ❖ **Continuing Negotiation** That place [Kē'e] is horrible for traffic...no easy solution. Guarantee that negotiation won't do a bit of good because the State has a bad rap...years of nothing and a bad attitude...just won't cut it on Kaua'i. But they have to negotiate with the people in good faith.
- ❖ **Relocate Comfort Station** There is rancor of the residents regarding the Comfort Station; put it somewhere else--anywhere along the dunes is bad .... State is aware - no one wants the Comfort Station there...it should be moved to the parking lot area....
- ❖ **Parking Lot** If you graded it away from that and maybe had a permeable surface paving ...we know that hardscape is not a good thing...the more permeable surfaces we can create the better. The problem with a lot of these, though, is intensity of use. This park gets a huge intensity of use. So things like grass-green, grass paving, and materials like that would not be functional...the high rainfall we get in Hā'ena. But maybe they have permeable cement and permeable asphalt...there's gravel paved systems - there's different things that could be looked at. This is probably the logical place, because it already has been destroyed and disturbed, to keep a parking lot. But I think environmentally how we deal with those issues in terms of the *lo'i*, I think, is going to be really important because the *lo'i* are going to be a really important part of the cultural landscape of the park.
- ❖ **Retreat Resource** One of the things, though, that this Plan doesn't show on it is there's a house in this area in here, which this guy Rusty used to live in this house long time ago. It's really really run down. I'm not sure if it's at the point where you could still salvage it or not, you might be able

to, but I think this Plan is kind of completely absent on it...and there's a road that goes down to there. And I think it is an under-recognized resource because within the context of this Park and the cultural use of this Park, I think you're going to need to have places like that that are kind of like retreat centers where cultural groups could come...whether they stay there over night or not. I think having something like that in the Park here could be really important. Also the Hui Maka'āinana Makana which we established a curatorship program with the State back in 1999 for the archaeology - primarily for the *lo'i* complex. It would be really good for them to have a place where they could have meetings and functions related to their curatorship of the cultural sites within the park. So that is something that I would like to see changed or enhanced on this Plan

- ❖ **Full-time Caretaker/Kahu** The nights...I know the idea of the full position of a caretaker and that particular house...probably thinking that closer to the entrance. The caretaker is a traditional part of our culture, to have the caretaker close in. Security twenty-four hours a day would be nice, although I'm hard pressed at this particular time to actually point at the type of vandalism one would expect right there. However, the presence 24/7 in the zone is really good
- ❖ **Additional Beach Focus** I'm not really comfortable with not including the beach area that's in front of Taylor Camp into the whole scope of the park. I think you're defeating the purpose in the Master Plan by only taking a tiny portion which is the actual end of the road, and ignoring three-quarters of the land footprint in the planning process
- ❖ **Safety/Loop Trail** Addressing the liability issues, I don't think we're going to get into this particular point, but I do know that it's serious with the rockfalls...that a good section of the road that you're walking or driving, is right next to a cliff. Therefore, the suggestion of leading the paths out and away from the parking lot and towards the ocean and doing the loop and so it keeps people into more of the open plains rather than along the edge of the cliff. Although the traffic, whether it's going to be shuttle buses - whatever the nature of the concessions they have in mind, I'm not really sure of how they are going to be doing it, they're going to still be using the road as a footprint
- ❖ **Concessions/Revenues** I know there's discussions on the different natures of concessions, but then again that's concessions whether it's neighborhood driven or beyond at this particular point - naturally the first choice would be within the *ahupua'a* of Hā'ena and then Wainiha after that, and then expand out. I wouldn't mind seeing - I understand that the reason why SHPD, or being the State Parks, need the money that these parks can generate with the revenues, it would be nice for the first five years that fifty percent of the revenues stay in the park, after that then maybe twenty-five percent depending on the infrastructure. I think it's pretty reasonable to start the ball with expecting a hundred percent revenue to stay in the park. But some sort of arrangement as to a percentage based on years, either going up or going down over the years, needs to be discussed and broken down into the various - the methodology just in that alone, right! But to begin a discussion, I think fifty percent of it needs to stay or a certain length of time to allow some of the infrastructure to get settled in by the volunteer groups

#### 5.8.0 ADDITIONAL RECOMMENDATION

It is highly recommended that a Cultural Advisory Committee or Group be formed, hopefully including the interviewees, who would provide cultural expertise during the Master Plan/EIS process and during any later Park development projects. They can also provide direction in the likely event that more burials are uncovered during any future sub-surface activity within Hā'ena State Park.

## APPENDIX A

### Act 50 - 2000

#### A BILL FOR AN ACT RELATING TO ENVIRONMENTAL IMPACT STATEMENTS [UNOFFICIAL VERSION]

HOUSE OF REPRESENTATIVES H.B. NO. 2895 H.D.1  
 TWENTIETH LEGISLATURE, 2000  
 STATE OF HAWAII

#### A BILL FOR AN ACT RELATING TO ENVIRONMENTAL IMPACT STATEMENTS.

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF HAWAII:

SECTION 1. The legislature finds that there is a need to clarify that the preparation of environmental assessments or environmental impact statements should identify and address effects on Hawai'i's culture, and traditional and customary rights.

The legislature also finds that native Hawaiian culture plays a vital role in preserving and advancing the unique quality of life and the "aloha spirit" in Hawai'i. Articles IX and XII of the state constitution, other state laws, and the courts of the State impose on government agencies a duty to promote and protect cultural beliefs, practices, and resources of native Hawaiians as well as other ethnic groups.

Moreover, the past failure to require native Hawaiian cultural impact assessments has resulted in the loss and destruction of many important cultural resources and has interfered with the exercise of native Hawaiian culture. The legislature further finds that due consideration of the effects of human activities on native Hawaiian culture and the exercise thereof is necessary to ensure the continued existence, development, and exercise of native Hawaiian culture.

The purpose of this Act is to: (1) Require that environmental impact statements include the disclosure of the effects of a proposed action on the cultural practices of the community and State; and (2) Amend the definition of "significant effect" to include adverse effects on cultural practices.

SECTION 2. Section 343-2, Hawai'i Revised Statutes, is amended by amending the definitions of "environmental impact statement" or "statement" and "significant effect", to read as follows:

"Environmental impact statement" or "statement" means an informational document prepared in compliance with the rules adopted under section 343-6 and which discloses the environmental effects of a proposed action, effects of a proposed action on the economic [and] welfare, social welfare, and cultural practices of the community and State, effects of the economic activities arising out of the proposed action, measures proposed to minimize adverse effects, and alternatives to the action and their environmental effects.

The initial statement filed for public review shall be referred to as the draft statement and shall be distinguished from the final statement which is the document that has incorporated the public's comments and the responses to those comments. The final statement is the document that shall be evaluated for acceptability by the respective accepting authority.

"Significant effect" means the sum of effects on the quality of the environment, including actions that irrevocably commit a natural resource, curtail the range of beneficial uses of the environment, are contrary to the State's environmental policies or long-term environmental goals as established by law, or adversely affect the economic [or] welfare, social welfare[.], or cultural practices of the community and State."

SECTION 3. Statutory material to be repealed is bracketed. New statutory material is underscored.

SECTION 4. This Act shall take effect upon its approval.

**Approved by the Governor as Act 50 on April 26, 2000**

## APPENDIX B

### Scope of Work (SOW)

#### Cultural Impact Assessment [in accordance with OEQC Guidelines]

1. identify and consult with individuals and organizations with expertise concerning the types of cultural resources, practices and beliefs found within the broad geographical area, e.g., district or ahupua'a;
2. identify and consult with individuals and organizations with knowledge of the area potentially affected by the proposed action;
3. receive information from or conduct ethnographic interviews and oral histories with persons having knowledge of the potentially affected area;
4. conduct ethnographic, historical, and other culturally related documentary research;
5. identify and describe the cultural resources, practices and beliefs located within the potentially affected area; and
6. assess the impact of the proposed action, alternatives to the proposed action, and mitigation measures, on the cultural resources, practices and beliefs identified.

#### Methods

The specific tasks listed below expand on the above scope of work:

- ✦ Conduct historical and cultural background research (i.e., business records, land records; archival documents, literature, reports, letters, photographs, journals, or newspaper files) to locate material that will provide broad patterns of the history of the project area such as subsistence, religious, recreational, and commercial uses of the land; as well as settlement and residential patterns of the area and region; major family groups that inhabited, used or controlled lands within the project area and region; documented legends, myths, or traditional histories associated with the area; and descriptions of traditional practices, customs and beliefs associated with identified traditional cultural practices;
- ✦ Prepare a semi-structured ethnographic research instrument that will include questions that will generate general biographical information, association with and knowledge of the project area, its history and use
- ✦ Prepare a consent form to be used as written agreement with any individual interviewed concerning the review of content and use of information recorded during the interview
- ✦ Identify individuals knowledgeable with the project area.
- ✦ Conduct and record ethnographic interviews with knowledgeable individuals. If feasible individuals shall participate in field inspections (Makana to be given)
- ✦ Transcribe recorded interviews (Approximate time, 68 hrs/per hr of recording)
- ✦ Prepare a report that will include an overview of the archival material, and an analysis of the ethnographic data.

## APPENDIX C

### **Guidelines for Assessing Cultural Impacts** Adopted by the Environmental Council, State of Hawai'i November 19, 1997

#### I. INTRODUCTION

It is the policy of the State of Hawai'i under Chapter 343, HRS, to alert decision makers, through the environmental assessment process, about significant environmental effects which may result from the implementation of certain actions. An environmental assessment of cultural impacts gathers information about cultural practices and cultural features that may be affected by actions subject to Chapter 343, and promotes responsible decision making.

Articles IX and XII of the State Constitution, other state laws, and the courts of the state require government agencies to promote and preserve cultural beliefs, practices, and resources of native Hawaiians and other ethnic groups. Chapter 343 also requires environmental assessment of cultural resources, in determining the significance of a proposed project.

The Environmental Council encourages preparers of environmental assessments and environmental impact statements to analyze the impact of a proposed action on cultural practices and features associated with the project area. The Council provides the following methodology and content protocol as guidance for any assessment of a project that may significantly affect cultural resources.

#### II. CULTURAL IMPACT ASSESSMENT METHODOLOGY

Cultural impacts differ from other types of impacts assessed in environmental assessments or environmental impact statements. A cultural impact assessment includes information relating to the practices and beliefs of a particular cultural or ethnic group or groups.

Such information may be obtained through scoping, community meetings, ethnographic interviews and oral histories. Information provided by knowledgeable informants [consultants], including traditional cultural practitioners, can be applied to the analysis of cultural impacts in conjunction with information concerning cultural practices and features obtained through consultation and from documentary research.

In scoping the cultural portion of an environmental assessment, the geographical extent of the inquiry should, in most instances, be greater than the area over which the proposed action will take place. This is to ensure that cultural practices which may not occur within the boundaries of the project area, but which may nonetheless be affected, are included in the assessment. Thus, for example, a proposed action that may not physically alter gathering practices, but may affect access to gathering areas would be included in the assessment. An ahupua'a is usually the appropriate geographical unit to begin an assessment of cultural impacts of a proposed action, particularly if it includes all of the types of cultural practices associated with the project area. In some cases, cultural practices are likely to extend beyond the ahupua'a and the geographical extent of the study area should take into account those cultural practices.

The types of cultural resources The historical period studied in a cultural impact assessment should commence with the initial presence in the area of the particular group whose cultural practices and features are being assessed. The types of cultural practices and beliefs subject to assessment may include subsistence, commercial, residential, agricultural, access-related, recreational, and religious and spiritual customs.

The types of cultural resources subject to assessment may include traditional cultural properties or other types of historic sites, both man made and natural, including submerged cultural resources, which support such cultural practices and beliefs.

The Environmental Council recommends that preparers of assessments analyzing cultural impacts adopt the following protocol:

1. identify and consult with individuals and organizations with expertise concerning the types of cultural resources, practices and beliefs found within the broad geographical area, e.g., district or ahupua'a;
2. identify and consult with individuals and organizations with knowledge of the area potentially affected by the proposed action;
3. receive information from or conduct ethnographic interviews and oral histories with persons having knowledge of the potentially affected area;
4. conduct ethnographic, historical, anthropological, sociological, and other culturally related documentary research;
5. identify and describe the cultural resources, practices and beliefs located within the potentially affected area; and
6. assess the impact of the proposed action, alternatives to the proposed action, and mitigation measures, on the cultural resources, practices and beliefs identified.

Interviews and oral histories with knowledgeable individuals may be recorded, if consent is given, and field visits by preparers accompanied by informants are encouraged. Persons interviewed should be afforded an opportunity to review the record of the interview, and consent to publish the record should be obtained whenever possible. For example, the precise location of human burials are likely to be withheld from a cultural impact assessment, but it is important that the document identify the impact a project would have on the burials. At times an informant [consultant] may provide information only on the condition that it remain in confidence. The wishes of the informant should be respected.

Primary source materials reviewed and analyzed may include, as appropriate: Mahele, land court, census and tax records, including testimonies; vital statistics records; family histories and genealogies; previously published or recorded ethnographic interviews and oral histories; community studies, old maps and photographs; and other archival documents, including correspondence, newspaper or almanac articles, and visitor journals. Secondary source materials such as historical, sociological, and anthropological texts, manuscripts, and similar materials, published and unpublished, should also be consulted. Other materials which should be examined include prior land use proposals, decisions, and rulings which pertain to the study area.

#### III. CULTURAL IMPACT ASSESSMENT CONTENTS

In addition to the content requirements for environmental assessments and environmental impact statements, which are set out in HAR §§ 11-200-10 and 16 through 18, the portion of the assessment concerning cultural impacts should address, but not necessarily be limited to, the following matters:

1. A discussion of the methods applied and results of consultation with individuals and organizations identified by the preparer as being familiar with cultural practices and features associated with the project area, including any constraints or limitations which might have affected the quality of the information obtained.
2. A description of methods adopted by the preparer to identify, locate, and select the persons interviewed, including a discussion of the level of effort undertaken.

3.Ethnographic and oral history interview procedures, including the circumstances under which the interviews were conducted, and any constraints or limitations which might have affected the quality of the information obtained.

4.Biographical information concerning the individuals and organizations consulted, their particular expertise, and their historical and genealogical relationship to the project area, as well as information concerning the persons submitting information or interviewed, their particular knowledge and cultural expertise, if any, and their historical and genealogical relationship to the project area.

5.A discussion concerning historical and cultural source materials consulted, the institutions and repositories searched, and the level of effort undertaken. This discussion should include, if appropriate, the particular perspective of the authors, any opposing views, and any other relevant constraints, limitations or biases.

6.A discussion concerning the cultural resources, practices and beliefs identified, and, for resources and practices, their location within the broad geographical area in which the proposed action is located, as well as their direct or indirect significance or connection to the project site.

7.A discussion concerning the nature of the cultural practices and beliefs, and the significance of the cultural resources within the project area, affected directly or indirectly by the proposed project.

8.An explanation of confidential information that has been withheld from public disclosure in the assessment.

9.A discussion concerning any conflicting information in regard to identified cultural resources, practices and beliefs.

10.An analysis of the potential effect of any proposed physical alteration on cultural resources, practices or beliefs; the potential of the proposed action to isolate cultural resources, practices or beliefs from their setting; and the potential of the proposed action to introduce elements which may alter the setting in which cultural practices take place.

11.A bibliography of references, and attached records of interviews which were allowed to be disclosed.

The inclusion of this information will help make environmental assessments and environmental impact statements complete and meet the requirements of Chapter 343, HRS. If you have any questions, please call 586-4185.

## APPENDIX D CONSENT FORM

### Agreement to Participate in this Cultural Impact Study/Assessment

Project Title: **Hā'ena State Park CIS/A  
Hā'ena, Kē'ē and Limahuli**

Investigator: Maria "Kaimi" Orr, M.A. [(808) 375-3317]  
Kaimipono Consulting Services LLC  
[kaimi@lava.net](mailto:kaimi@lava.net)

You are being asked to participate in a cultural impact study/assessment [CIS/A] conducted by an independent investigator contracted by *PBR Hawai'i & Associates, Inc* as part of a larger Master Plan and Environmental Impact Statement they are conducting for Hā'ena State Park. The investigator will explain the purpose of this study, the procedures to be used, the potential benefits and possible risks of participating. You may ask the investigator any question(s) in order to help you to understand the study or procedures. A basic explanation of the study is written below. If you then decide to participate in the study, please sign on the second page of this form. You will be given a copy of this form to keep.

#### I. Nature and Purpose of the Study

The purpose of this cultural impact study/assessment is to gather information about the project lands of Hā'ena, through interviews with individuals who are knowledgeable about this area, and/or about traditional and historic information such as cultural practices, legends, songs, chants or other information. The objective of this study is to facilitate in the identification and location of any cultural resources and cultural practices in the area mentioned above, in accordance with applicable historic preservation laws, regulations, and guidelines, including: *Office of Environmental Quality Control [OEQC] Guidelines and Act 50 HB2895 [A.D.2000], HRS Chapter 343.*

#### II. Explanation of Procedures

After you have voluntarily agreed to participate and have signed the consent page, the investigator will tape record your interview and have it transcribed later. The investigator may also need to take notes and/or ask you to spell or clarify terms or names that are unclear. Data from the interview [ethnographic research] will be used in the CIS/A report.

#### III. Discomforts and Risks

Foreseeable discomforts and/or risks may include, but are not limited to the following: having to talk loudly for the recorder; being recorded and/or interviewed; providing information that may be used in reports which may be used in the future as a public reference; knowing that the information you give may conflict with information from others; your uncompensated dedication of time; possible miscommunication or misunderstanding in the transcribing of information; loss of privacy; and worry that your comment(s) may not be understood in the same way you understand them. It is not possible to identify all potential risks.

#### IV. Benefits

This study will give you the opportunity to express your thoughts (*mana'o*), and your opinions will be listened to and shared; your knowledge may be instrumental in the preservation of significant cultural resources, practices and information.

## V. Confidentiality

Your rights of privacy, confidentiality and/or anonymity will be protected **if you so desire**. You may request, for example, that your name and/or sex not be mentioned in write-ups, such as field notes, on tape, on files (disk or folders), drafts, reports, and future works; or you may request that some of the information you provide remain “off-the-record.” In order to ensure protection of your privacy, confidentiality and/or anonymity, you should immediately advise the investigator of your desires. The investigator will ask you to specify the method of protection, and note it on this form below.

## VI. Refusal/Withdrawal

You may, at any time during the interview process, choose to not participate any further and ask the investigator for the tape and/or notes. Please note that you will be given an opportunity to review your transcript, and to revise or delete any part of the interview.

## VII. Waiver

### Part I: Agreement to Participate

I, \_\_\_\_\_, understand that Maria “Kaimi” Orr, an independent investigator contracted by *PBR Hawai‘i & Associates, Inc.* will be conducting oral history interviews with individuals knowledgeable about the project lands and vicinity. The oral history interviews are being conducted in order to collect information on possible pre-historic and/or historic cultural resources, as well as traditional cultural practices associated with these lands and access to these resources and practices.

I understand I will be provided the opportunity to review my interview to ensure that it accurately depicts what I meant to say. **I also understand that if I don’t return the revised transcripts after two weeks from date of receipt, my signature below will indicate my release of information for the draft report. I also understand that I will still have the opportunity to make revisions during the draft review process.**

\_\_\_\_\_ I am willing to participate.

\_\_\_\_\_ I am willing to participate, under the following conditions:

|               |          |
|---------------|----------|
| Signature     | Date     |
| Print Name    | Phone    |
| Address       | Zip Code |
| Email Address |          |

MAHALO NUI LOA

## APPENDIX E ETHNOGRAPHIC INSTRUMENT Ethnographic Survey

### Basic Research Instrument for Oral History Interviews

This research instrument includes basic information as well as research categories which will be asked in the form of open primary questions which allow the individual interviewed (Consultant) to answer in the manner he/she is most comfortable. Secondary or follow-up questions are asked based on what the Consultant has said and/or to clarify what was said. The idea is to have an interview based on a “talk-story” form of sharing information. Questions will NOT be asked in an interrogation style/method, NOR will they necessarily be asked in the order presented below. This research instrument is merely a *guide* for the investigator and simply reflects general categories of information sought in a semi-structured format. Questions will be asked more directly when necessary.

The Consultants were selected because they met one or more of the following criteria:

- ❖ Had/has Ties to Project Area/Vicinity
- ❖ Known Hawaiian Cultural Resource Person
- ❖ Known Hawaiian Traditional Practitioner
- ❖ Referred By Other Cultural Resource People
- ❖ Referred By Client Staff

**[NOTE: This part of the interview, #1 –4 is mutual sharing and rapport building. Most of the information for research categories “Consultant Background” and “Consultant Demographics” come from this section, but not exclusively.]**

### 1. *To start please tell me about yourself... Name? Where/When you were born?*

[This information can be addressed in a couple of ways. After the investigator first turns on the tape recorder, the following information will be recorded: Day/Date/Time/Place of Interview; Name of Consultant (if authorized by Consultant); Name of Investigator; Initial Questions: Have you read the Agreement to Participate? Do you have any questions before we begin? Will you please sign the Consent Page. The investigator will explain again the purpose of the interview.

The investigator will then ask the Consultant to “Please tell me about yourself--when/where were you born? Where did you grow up? Where did you go to school?” This general compound question allows the Consultant to share as much or as little as he/she wants without any pressure. Some of the information for #1 may already be known to the investigator.]

### 2. *History: Your ‘ohana/family background; Hawaiian connection (if any)?*

[Much of the information for questions #2, 3, and 4 usually comes from the “monologue” answer to Question #1. If it does not, then these questions will be asked. The answers in this section usually establish how the Consultant meets the criteria; how the Consultant developed his/her information base, etc.]

### 3. *Youth: Where lived? Grew up?* [This may have been answered in #1]

### 4. *Schooling? Where? When?* [This may have been answered in #1]

**[NOTE: The next part of the interview, #5-7 reflects information sought for the following research categories: Land, Water, Marine, Cultural Resources and Use as well as Significant People and Events. The questions**

are open-ended so as NOT to “put words in the mouths” of the Consultants. The answers will help in assessing if any cultural properties or practices (or access to them) will be impacted by the proposed project.]

## APPENDIX F RELEASE FORM

5. *Please tell me what you know about the lands of Hā`ena, Ke`e and Limahuli?*

[NOTE: Generally when people share information about a specific topic/place, they usually state where their information came from. If it isn't volunteered, it is asked as a follow-up question(s). A map of the project area should be available to confirm that investigator and consultant are talking about the same place. Photos would also help if a field trip is not possible. The best scenario would be to be “on-site” at some part of the interview...although this is not always practical.]

6. *What are your recollections and/or personal experiences of this area?*

7. *Do you know any stories/legends/songs/chants associated with these areas?*

[NOTE: Possible follow-up questions if information not in their answers:

- How are you or your family connected to the lands of Hā`ena, Ke`e and/or Limahuli?
- What year(s) were you and/or your family associated with these lands?
- What was this place/area called when you were growing up? When you were working here?
- Can you describe what the area looked like--what kinds of natural and/or man made things?
- To your knowledge what kind of activities took place in this location?
- Do you know of any traditional gathering of plants, etc in the area?
- Please describe any other land/water use? Resources?
- What was the historic land use? Agriculture? Habitation? Dwellings? Military? Ranching?
- **[Have map ready for marking.]**
- Do you know about any burials in the project area? [last resort question]
- Do you know of any cultural sites in the project area or vicinity? [last resort question]

8. *Is there anyone you know who can also tell me about the project area?*

[NOTE: Usually in the course of the interview, Consultants suggest other people to interview.]

9. *As soon as the tape of this interview is transcribed I will send you two sets. Please review your transcript and make any corrections and/or additions, then sign both copies of the Release Forms thereby allowing the information to be used by the investigator, PBR Hawai`i & Associates, Inc. and Hā`ena State Park. Then mail one set back in the enclosed stamped-addressed envelope.*

10. *If your revised transcript is not returned within two weeks of date of receipt, it will be assumed that you are in concurrence with the transcript material and your information will then be incorporated into any draft reports. However, you can still make changes during the draft review process.*

**MAHALO NUI LOA**

### Part II: Personal Release of Interview Records

I, \_\_\_\_\_, have been interviewed by Maria “Kaimi” Orr of Kaimipono Consulting Services LLC, an independent investigator contracted by PBR Hawai`i & Associates, Inc. I have reviewed the transcripts of tape recordings of the interview and agree that said documentation is complete and accurate except for those matters specifically set forth below the heading “CLARIFICATION OR CORRECTIONS.”

### CLARIFICATION OR CORRECTIONS:

*I further agree that KCS and/or PBR Hawai`i may use and release my identity and other interview information, both oral and written, for the purpose of using such information in a report to be made public, subject to my specific objections, to release as set forth below under the heading “SPECIFIC OBJECTIONS TO RELEASE OF INTERVIEW MATERIALS.”*

### SPECIFIC OBJECTIONS TO RELEASE OF INTERVIEW MATERIALS:

|            |       |
|------------|-------|
| Signature  | Date  |
| Print Name | Phone |
| Address    |       |
| Zipcode    |       |

## APPENDIX G

### Ali'i Aimoku of Kaua'i

The monarchs of island Kaua'i like those of the other Hawaiian Islands, claim descent from Wakea and Papa. Nanaulu, a descendant in the fourteenth generation from Wakea, was the ancestor of Moikeha, 1st Alii Aimoku of Kaua'i, but his dynasty was supplanted after two generations. The second or Puna dynasty was established by La'amaiahiki, eleventh in descent from Puna who was twenty-fourth in descent from Wakea. O'ahu and Kaua'i are the most ancient. The last Ali'i 'Aimoku of Kaua'i of the old uninterrupted line of Puna was Kawelo'a'maihunali'i. After his death the kingship of Kaua'i fell on Kūali'i, the Ali'i 'Aimoku of O'ahu and cousin of Kawelo'a'maihunali'i. In 1810, King Kaumuali'i, the 23rd Ali'i 'Aimoku of Kaua'i, ceded his kingdom to King Kamehameha I of Hawai'i, in an effort to avoid bloodshed. Thereafter, he ruled as a tributary, until kidnapped by King Kamehameha II and taken to Honolulu in 1821. After his death in 1824, his son and heir, George Humehume attempted to re-establish his independence on Kaua'i, but was also eventually captured and taken to Honolulu. Ironically, the rights to the crown of the Hawaiian Islands now rest with Kaumuali'i's heirs the Kawanakoaas after the death of the Kamehamehas and Kalakauas.

### List of Alii Aimoku of Kaua'i

- Ali'i nui [Moikeha](#) 1st Alii Aimoku of Kaua'i
- Ali'i nui [Haulanuiakaikea](#) 2nd Alii Aimoku of Kaua'i

I, Fredrick B. Wickham, understand that Maria "Kaimi" Orr, an independent investigator contracted by PBR Hawaii & Associates, Inc. will be conducting oral history interviews with individuals knowledgeable about the project lands and vicinity. The oral history interviews are being conducted in order to collect information on possible pre-historic and/or historic cultural resources, as well as traditional cultural practices associated with these lands and access to these resources and practices.

I understand I will be provided the opportunity to review my interview to ensure that it accurately depicts what I meant to say. I also understand that if I don't return the revised transcripts after two weeks from date of receipt, my signature below will indicate my release of information for the draft report. I also understand that I will still have the opportunity to make revisions during the draft review process.

☒ I am willing to participate.  
☐ I am willing to participate, under the following conditions:

#### IV. Benefits

This study will give you the opportunity to express your thoughts (*mana'o*), and your opinions will be listened to and shared; your knowledge may be instrumental in the preservation of significant cultural resources, practices and information.

#### V. Confidentiality

Your rights of privacy, confidentiality and/or anonymity will be protected **if you so desire**. You may request, for example, that your name and/or sex not be mentioned in write-ups, such as field notes, on tape, on files (disk or folders), drafts, reports, and future works; or you may request that some of the information you provide remain "off-the-record." In order to ensure protection of your privacy, confidentiality and/or anonymity, you should immediately advise the investigator of your desires. The investigator will ask you to specify the method of protection, and note it on this form below.

#### VI. Refusal/Withdrawal

You may, at any time during the interview process, chose to not participate any further and ask the investigator for the tape and/or notes. Please note that you will be given an opportunity to review your transcript, and to revise or delete any part of the interview.

#### VII. Waiver

##### Part I: Agreement to Participate

I, Randy Wickham, understand that Maria "Kaimi" Orr, an independent investigator contracted by PBR Hawaii & Associates, Inc. will be conducting oral history interviews with individuals knowledgeable about the project lands and vicinity. The oral history interviews are being conducted in order to collect information on possible pre-historic and/or historic cultural resources, as well as traditional cultural practices associated with these lands and access to these resources and practices.

I understand I will be provided the opportunity to review my interview to ensure that it accurately depicts what I meant to say. I also understand that if I don't return the revised transcripts after two weeks from date of receipt, my signature below will indicate my release of information for the draft report. I also understand that I will still have the opportunity to make revisions during the draft review process.

☒ I am willing to participate.  
☐ I am willing to participate, under the following conditions:

APPENDIX I  
SIGNED RELEASE FORMS

(Copies)

Part II: Personal Release of Interview Records

I, Frederick B. Wichman, have been interviewed by Maria "Kaimi" Orr of Kaimipono Consulting Services LLC, an independent investigator contracted by PBR Hawaii & associates, Inc. I have reviewed the transcripts of tape recordings of the interview and agree that said documentation is complete and accurate except for those matters specifically set forth below the heading "CLARIFICATION OR CORRECTIONS."

CLARIFICATION OR CORRECTIONS:

I further agree that KCS and/or PBR Hawaii may use and release my identity and other interview information, both oral and written, for the purpose of using such information in a report to be made public, subject to my specific objections, to release as set forth below under the heading "SPECIFIC OBJECTIONS TO RELEASE OF INTERVIEW MATERIALS."

SPECIFIC OBJECTIONS TO RELEASE OF INTERVIEW MATERIALS:

*I ask that the sections I have marked as "Please delete" not be used in any way.*

## TRAFFIC IMPACT ANALYSIS REPORT HĀ'ENA STATE PARK Kaua'i, Hawai'i

### I. INTRODUCTION

This report documents the findings of a traffic study conducted by Austin, Tsutsumi & Associates, Inc. (ATA) to evaluate the potential traffic impacts resulting from the proposed Hā'ena State Park Master Plan (Project).

#### A. Background

The proposed Master Plan will be limiting the number of visitors and the amount of vehicular traffic into Hā'ena State Park to help improve safety, mitigate impacts to the unique cultural and natural resources, and enrich visitor experience at the park. The initial proposed visitor limit is 900 people per day but this number could be adjusted over time based on the impacts to the park. This daily visitor limit does not include the 60 overnight camping permits for the Kalalau Trail. This would represent a significant reduction from the park's current number of visitors, estimated at 2,000 visitors per day.

Similar to the previous Draft Master Plan, the proposed plan will have roughly 100 parking stalls in the main parking lot and an additional 13 special parking stalls at Kē'ē Beach. This report will also investigate the requirements for a shuttle service between Hā'ena State Park and a satellite parking area in Princeville that could be considered to support access to the park. The satellite parking area would be outside of the special flood hazard area as designated by the Federal Emergency Management Agency. This report will investigate existing

federal precedent, examples of similar applications, and estimate the cost of the proposed shuttle system (Shuttle).

This study will also analyze the traffic impacts of the proposed project and potential management options.

### B. Location

Hā'ena State Park is situated on approximately 65.7 acres of land located on the north shore of the island of Kaua'i. The park is bordered to the east by the Limahuli Stream, to the south by cliffs and by the Pacific Ocean to the north and west.

Sole access to Hā'ena State Park is provided via Kūhiō Highway, which terminates at Kē'ē Beach.

See Figure 1 for the location of the Hā'ena State Park. See Figure 2 for the Project Site Plan. See Figure 3 for the proposed parking lot.

### C. Study Methodology

This study will address the following:

1. Existing traffic operating conditions at key locations within the study area.
2. Existing precedent for shuttle services in state and/or national parks.
3. Estimation of shuttle operation costs.
4. Recommendations for shuttle operations.
5. Projected traffic impacts for the proposed master plan and management options.

## II. EXISTING CONDITIONS

### A. Roadway System

Sole ingress and egress to Hā'ena State Park is provided via Kūhiō Highway, which in the vicinity of the park is a winding two-lane roadway that runs east-west and terminates near Kē'ē Beach. Ten (10) one-lane bridges slow traffic between Princeville and Hā'ena State Park. The Kaua'i County General Plan (2000) stated the county's intent to maintain them; the bridges are valued for their historic significance and "traffic slowing" effect.<sup>1</sup>

Hā'ena State Park currently provides two parking lots. The first is approximately 750 feet west of the Hā'ena State Park entrance, and the second is where Kūhiō Highway terminates near Kē'ē beach. Due to the limited number of stalls, vehicles park along the road leading up to the beach. No sidewalks are provided for pedestrians.

### B. Existing Traffic Conditions Analysis and Observations

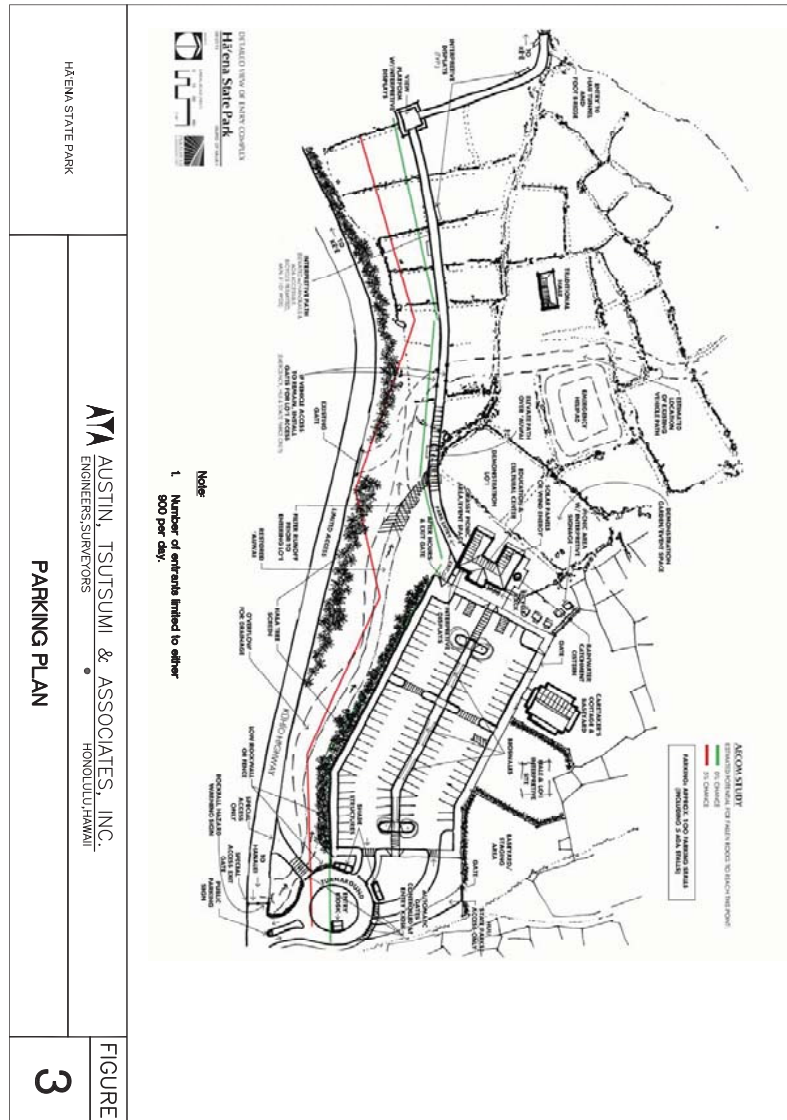

Along Kūhiō Highway and leading up to the park, no significant congestion was observed. However, in the areas between Princeville and Hā'ena State Park, a maximum of 4-vehicle queues were observed to form as they waited to traverse the numerous narrow 1-lane bridges. Otherwise, traffic flowed smoothly, though cautiously, due to the relatively low volume.

It is estimated that Kūhiō Highway operates at approximately 39 percent of capacity at the Waipa bridge based upon a bi-directional capacity of 1,250 vehicles per hour and a bi-directional volume of 487 vehicles per hour<sup>2</sup>. Refer to Appendix B for derivation.

Upon entering the Hā'ena State Park driveway (Kūhiō Highway), vehicles generally travel slowly to avoid pedestrians and oncoming vehicles. An incoming driver will first encounter an unpaved and un-striped parking lot on the right (makai), approximately 750 from the entrance. Visitors that use this parking lot must walk approximately 1,500 feet along the roadway to reach the beach, as no

<sup>1</sup> County of Kaua'i Planning Department, *Kaua'i General Plan*, (2000), 2-11.

<sup>2</sup> Field observations indicate that capacity might be lower than 1,400 – however, traffic was observed to flow smoothly.

sidewalk is provided. At the end of the road, there is a turnaround area wherein a limited number of parking stalls are provided. Due to the stalls' comparatively favorable location, congestion occurs as vehicles wait for them to be vacated. Some visitors were observed waiting for over five (5) minutes for a stall.

The 24-hr traffic count data was collected via pneumatic tubes laid at the Hā'ena State Park entrance between August 14, 2008 and August 18, 2008; this included a long weekend for Statehood Day. According to 1993 data from County of Kaua'i Lifeguards, Hā'ena State Park experiences its highest attendance during month of August.<sup>4</sup>

Approximately 1,550 vehicles per day were counted entering and exiting Hā'ena State Park (775 entering, 775 exiting). The heaviest hourly flow of traffic occurred on Thursday, August 14 between 1:15 and 2:15 PM, where 75 vehicles entered and 120 vehicles exited.

At the Hā'ena State Park entrance, the peak hours occurred towards the middle of the day. Near the Princeville Center, more typical commuter peak hours were observed. The traffic count data and respective peak hours are shown in Figure 5.

See Figure 4 for daily parking accumulation over a 5-day period.

<sup>4</sup> The Keith Companies, V-5.

### III. SHUTTLE RESEARCH

#### A. Background

##### Alternative Transportation in Parks and Public Lands (ATTPL)

In 1997, the Department of the Interior and Department of Transportation signed a Memorandum of Understanding (MOU) to “develop a plan for a comprehensive effort to improve public transportation in the National Parks.”

Pursuant to this goal, the “Alternative Transportation in Parks and Public Lands” program has been initiated in 2005 – with the stated purpose “to enhance the protection of national parks and public lands and to increase the enjoyment of those visiting parks and public lands.” The program authorized \$97 million dollars in funding for Alternative Transportation Systems (ATS) projects between fiscal years 2006 and 2009.

The program – while primarily geared towards National and Tribal parks, also states that “also eligible to apply are state, tribal, or local governmental authorities with jurisdiction over land in the vicinity of an eligible area, acting with the consent of the FLMA, alone or in partnership with an FLMA or governmental or nongovernmental participant.”

Funding is directed only towards either planning (studies to identify the best alternative) or implementation (capital improvements, i.e. equipment purchases) projects.

According to its 2007 program manual the demand for funding is “highly competitive,” with only half of the 2006 applicants having been funded.

##### Federal Lands Alternative Transportation Systems Study (2001)

This report identified prospective sites for either new or improved ATS at 207 locations throughout the country, including those listed in Table 1 below:

**Table 1: Hawai'i ATS Parks Information**

|                                  | Annual Visitation (2001) | Annual Visitation (2010) | Current ATS | ATS improvements or new ATS proposed? |
|----------------------------------|--------------------------|--------------------------|-------------|---------------------------------------|
| Haleakalā National Park          | 1.1 Mil.                 | 1.1 Mil.                 | None        | Yes                                   |
| Hawai'i Volcanoes National Park  | 1.5 Mil.                 | 1.3 Mil.                 | None        | Yes                                   |
| Kalaupapa National Historic Park | 75,000                   | 28,546                   | Plane       | Yes                                   |
| Pohakuloa Heiau National Park    | 200,000                  | 124,061                  | None        | Yes                                   |

It should be noted that ATS measures were recommended for all of the Hawai'i National Parks studied, though none have been implemented to-date for all but Kalaupapa National Historic Park.

The report identified that the following parks offered small or medium busses for use in shuttles as of 2001:

**Table 2: Nationwide Shuttle Use at National Parks**

| Park                                       | Annual Visitation | Existing ATS     |
|--------------------------------------------|-------------------|------------------|
| Red Rock Canyon National Conservation Area | 1,100,000         | Small/medium bus |
| Kenai National Wildlife Refuge             | 400,000           | Small/medium bus |
| Merritt Island National Wildlife Refuge    | 500,000           | Small/medium bus |
| Adams National Historic Park               | 65,000            | Historic trolley |
| Aztec Ruins National Monument              | 72,000            | Small/medium bus |
| Cabrillo National Monument                 | 1,200,000         | Small/medium bus |
| Chiricahua National Monument               | 195,000           | Small/medium bus |
| Devil's Postpile National Monument         | 125,000           | Small/medium bus |
| Eugene O'Neill National Historic Site      | 5,000             | Small/medium bus |
| Glacier National Park                      | 1,800,000         | Small/medium bus |
| Great Smoky Mountains National Park        | 10,000,000        | Historic trolley |
| Hot Springs National Park                  | 1,500,000         | Historic trolley |

|                                             |           |                  |
|---------------------------------------------|-----------|------------------|
| Jefferson National Expansion Memorial       | 1,000,000 | Small/medium bus |
| Kalaupapa National Historic Park            | 75,000    | Small/medium bus |
| Lyndon B. Johnson National Historic Park    | 125,000   | Small/medium bus |
| Natchez National Historic Park              | 41,000    | Historic trolley |
| Organ Pipe Cactus National Park             | 300,000   | Small/medium bus |
| Pinnacles National Monument                 | 95,000    | Small/medium bus |
| San Juan Island National Historical Park    | 250,000   | Small/medium bus |
| Scotts Bluff National Monument              | 150,000   | Small/medium bus |
| Sequoia and Kings Canyon National Parks     | 1,500,000 | Small/medium bus |
| Shenandoah National Park                    | 1,750,000 | Small/medium bus |
| Tallgrass Prairie National Preserve         | 100,000   | Small/medium bus |
| Tumacacori National Historic Park           | 62,500    | Small/medium bus |
| Wolf Trap Farm Park for the Performing Arts | 500,000   | Small/medium bus |

Budgetary and ridership information was not readily available for most of these sites.

## B. Case Studies

### Zion National Park (Utah)

Zion National Park served 2.7 million visitors in 2010, and implemented a mandatory shuttle system in 2000. In the year 2000, the shuttle transported 2,994 passengers per day. The annual operating costs of the system are estimated to be \$2.5 million, or \$1 per visitor. Capital improvements to initiate the program were \$27.4 million.

Source: <http://www.nps.gov/zion/planyourvisit/shuttle-system.htm>

### Kalaeloa Homeless Shelter

Established in June, 2008, this program utilizes 2 full-sized busses and 1 van. The bus provides transit between Kalaeloa and the Kapolei Transit Station and is operational during the following hours:

- Monday-Friday: 7:00 AM-4:30 PM, with a headway of 60 minutes.
- Saturday & Sunday: 8:30 AM-4:00 PM, with a headway of 90 minutes.

The program operates on an annual budget of approximately \$152,000, but is also supplemented by the Hawai'i Helping the Hungry Have Hope (H-5) Program.

### Kaua'i Bus System

The Kaua'i Bus system provides six (6) routes – with headways generally at 60 minutes between arrivals. Notable statistics<sup>5</sup>:

- Ridership for March 2011: 51,894 trips
- Annual Budget (2012): \$5,550,482
- Salaries and Wages (2012): \$2,500,464
- Bus Driver Wage: \$19.22/hour
- Hourly costs: \$69/service hour/bus

### Speedishuttle

During this investigation, Speedishuttle was found to be the only shuttle operator on Kaua'i providing service between the Airport and hotel destinations. According to its website, the lowest one-way fare was \$9 per passenger.

<sup>5</sup> County of Kaua'i Transportation Agency, 2012 Budget Presentation (2011), 3,7,9.

#### **TheBus (Honolulu)**

Honolulu's TheBus system operates with a \$125 Million subsidy and charges its approximately 73 Million riders \$2.50 each way, with special pricing for monthly, annual, senior, child, and student passes. Its busses carry between 63 and 103 passengers per bus.

The annual subsidy, divided by the number of passengers, equates to approximately \$3.40 for each round-trip ride. Added to the standard bus fare of \$5.00/round trip, the total cost for each round trip is approximately \$8.40, despite the fact that the carrying capacity is at least three times as great as the proposed Shuttle system.

#### **IV. ALTERNATIVES ANALYSIS**

As mentioned in the introduction, the proposed Master Plan will be limiting the number of visitors to 900 per day. The following scenarios were considered:

**Scenario 1** – Limit the number of visitors to 900 persons per day and reduce the number of parking stalls to 100.

**Scenario 2** – Limit the number of visitors to 900 persons per day, and reduce the number of parking stalls to 50. Provide a shuttle service between Princeville and Hā'ena State Park.

**Scenario 3** – Limit the number of visitors to 900 persons per day, and eliminate the parking lot. Provide a shuttle service between Princeville and Hā'ena State Park.

**Scenario 4** – Do not limit the number of visitors to Hā'ena State Park; reduce the number of parking stalls to 50. Provide a shuttle service between Princeville and Hā'ena State Park.

**Scenario 5** – Do not limit the number of visitors to Hā'ena State Park; eliminate the parking lot. Provide a shuttle service between Princeville and Hā'ena State Park.

##### **A. Traffic Analysis**

Although some congestion currently occurs within the Hā'ena State Park site, traffic along the roadways leading up to Hā'ena State Park is relatively light. The proposed shuttle system would serve to significantly reduce the number of vehicles destined towards Hā'ena State Park. This impact would improve queuing while reducing the amount of traffic at all of the historic one-lane bridges between the Princeville Center (proposed shuttle terminus) and Hā'ena State Park to below the current 39 percent of capacity. See Table 3 for a comparative analysis of the scenarios during the critical PM peak hour of traffic. The Waipa bridge was analyzed as the measure of capacity because it is the longest one-lane span between Princeville and Hā'ena State Park, and is close to the HDOT count location used in this study.

Table 3: Capacity Analysis of Waipa Bridge During the Critical PM Peak Hour.

| Scenario                               | Bi-directional Flow @<br>Waipa Bridge (veh./hr.) | Estimated Bridge<br>Capacity (veh./hr.) | Volume-to-<br>Capacity Ratio |
|----------------------------------------|--------------------------------------------------|-----------------------------------------|------------------------------|
| Existing                               | 487                                              | 1250                                    | 39%                          |
| Scenario 1                             | 388                                              | 1250                                    | 31%                          |
| Scenario 1 w/carpooling (4 pers./veh.) | 358                                              | 1250                                    | 29%                          |
| Scenario 2                             | 323                                              | 1250                                    | 26%                          |
| Scenario 3                             | 319                                              | 1250                                    | 26%                          |
| Scenario 4                             | 337                                              | 1250                                    | 27%                          |
| Scenario 5                             | 333                                              | 1250                                    | 27%                          |

Note: Bridge capacity estimated based upon Simtraffic Analysis of existing conditions.

While vehicle occupancy rates are estimated to be approximately 2.5 persons/vehicle, "Scenario 1 w/carpooling" assesses the impact of increasing the occupancy to 4 persons per vehicle.

See Figure 5 for traffic volumes with and without the proposed shuttle system (scenario 1).

The shuttle system would also reduce traffic throughout the Hanalei and Princeville Area. However, the access point to the shuttle pick-up/drop-off terminus is anticipated to generate a maximum of 60, 70, 140, and 150 vehicles per hour entering/exiting the site, respectively for shuttle scenarios 2, 3, 4, and 5 (refer to section IV.D. for description). The arrivals are assumed to be relatively uniform as a result of the reservation system.

#### B. Shuttle (Scenarios 2-5)

It is proposed that the shuttle run between Hā'ena State Park and the Princeville Center with no stops in-between. The number of busses and proposed headways will be scenario-based and discussed in section III.C below.

It is anticipated that if the number of entrants into the park are limited, some form of communication or a reservation system will be needed to ensure against backlogs and long wait times at the shuttle's entrance point. This could be accomplished through any combination of the following methods:

- **Online reservation system** – Tickets would have to be presented to ride the shuttle; walk-in's would be accepted, but given last priority.

Ideally, the departure time would be reserved as well to ensure that long delays are prevented while leaving the park as well. The implementation cost of such a system is currently unknown, and will require further study.

- **Bus Driver Fare Collection Method** – Given that an online ticket reservation system might be costly to implement, it is possible that bus drivers could collect the money themselves. However, this would slightly increase the time required at stops. This method is not recommended where entry restrictions are enacted for Hā'ena State Park due to the potential for wasted trips and long wait times at the shuttle terminus.
- **Kiosk Fare Collection Method** – Would require a manned kiosk where ride fares could be collected and tickets distributed. The kiosk's operator could perform other tasks, such as:
  - Gather and disseminate information regarding current shuttle wait times; the information could be provided to hotels, or be managed via a website.
  - Serve as the hub of communication in the event of an emergency or compromised road conditions.

It is assumed that handicapped park entrants will be allowed to park in the parking lot at Hā'ena State Park.

It is recommended that a roadside sign be installed along Kūhiō Highway ahead of the Park and Ride to inform visitors that shuttle service to the park is required and that vehicles will not be allowed to park unless passes are purchased.

This will encourage visitors to plan their trips ahead of arrival and prevent visitors from parking throughout the surrounding neighborhoods and walking in.

#### C. Engineering Considerations

Due to the narrow and winding roadways between Hā'ena State Park and Princeville, it is recommended that as a maximum, only 15- or 20-passenger

vehicles be used as shuttles, as vehicles of this size were reported to have been used along these routes during five days of filming of the Pirates of the Caribbean: On Stranger Tides movie in 2010. Parking was also available to the east of the County's Hā'ena Park. See Figure 5.

The following information was gleaned from the experience:

1. Flagmen and road signage were used to help the vehicles in areas streets were narrow and/or curvy. This could denote that there were issues with sight distance and or traversal of narrow segments.
2. Two 15-passenger and one wheelchair-ready 20-passenger van were used to shuttle beachgoers.

It should be noted that topographical survey data was not available at the time of this report, and therefore vehicle navigability was not explicitly considered. Further study and/or test runs may be necessary prior to implementation and could affect vehicle size/model selection.

The 12 bridges along the proposed Shuttle route appear to offer sufficient theoretical carrying capacity to accommodate 15-20 passenger shuttles. See Table 4.

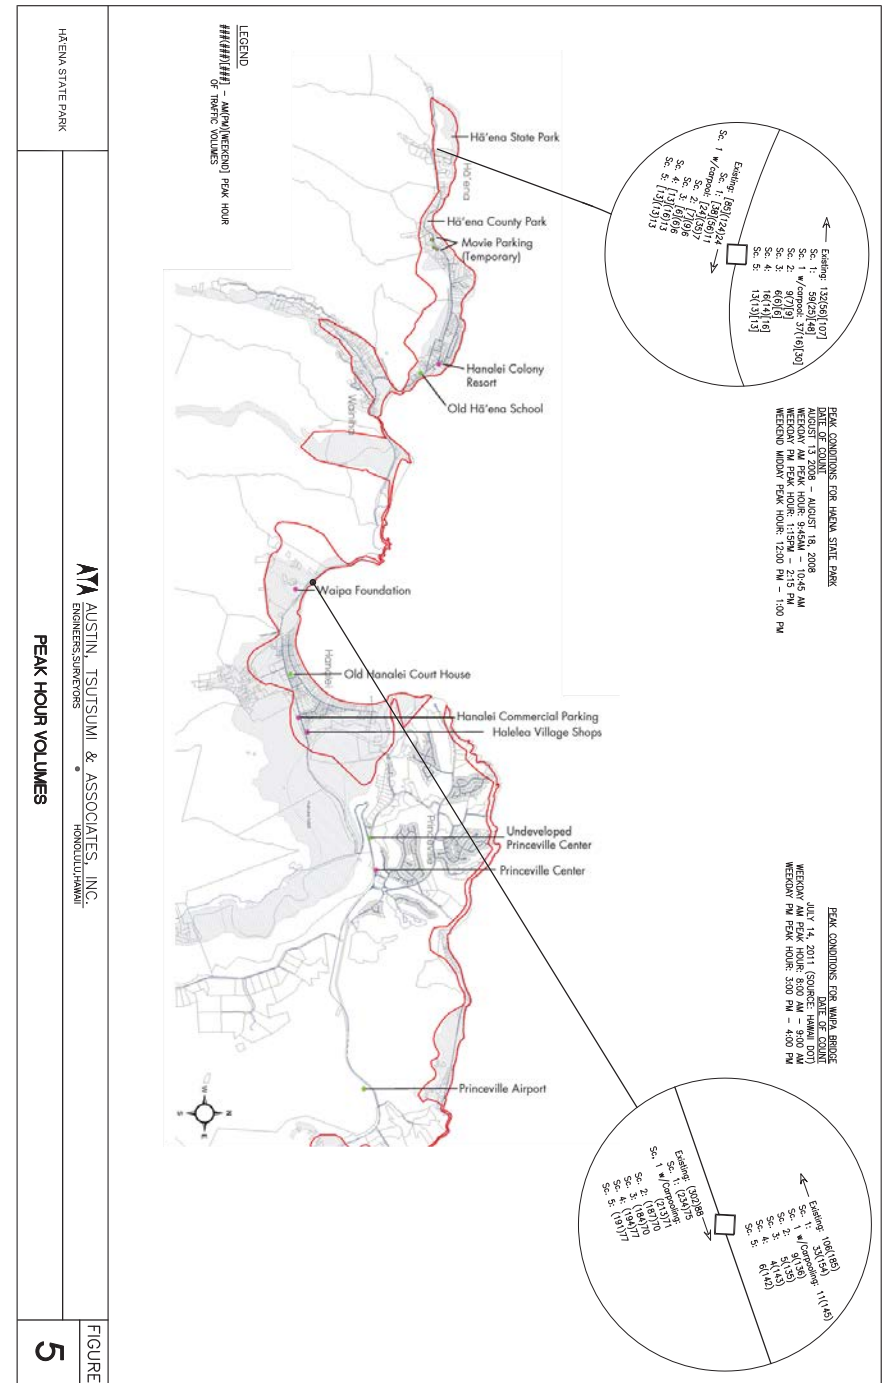

Table 4: Existing Bridge Capacity

| Bridge Name             | MP    | Type                 | Year Constructed | Length (ft.) | Load Rating | Load Restriction (lbs.)* |
|-------------------------|-------|----------------------|------------------|--------------|-------------|--------------------------|
| <b>Kaua'i Route 560</b> |       |                      |                  |              |             |                          |

\*Information provided by the Hawai'i Department of Transportation.

Typical 15- and 20- passenger vans have gross vehicle weights (includes passengers and load) of approximately 10,000 lbs.

#### D. Shuttle Cost Estimate

##### Assumptions

- Based on information collected in 2011.
- Per-van cost \$920/day
  - Driver cost: \$600/day
  - Van O&M: \$300/day
  - Van cost (amortized over 5 years): \$20/day
- Administrative costs:
  - Assume 2 positions (1 full-time, and 1 part-time) in addition to a web startup fee (not based upon any research). \$610/day with amortized web startup fee.
    - \$577/8 hours = \$72.12/hour for Administrator (incl. overhead cost).
    - \$33\*365 days\*5 years = \$60,000 for web startup fee.
- Round trip duration: 70 minutes
- ADA accessibility: It was assumed that an ADA-accessible van would render approximately 4-5 seats unusable. This will vary depending upon the make and model of the van.
- Van capacity: 15 persons (20-person van with reductions for wheelchair capability and partial occupancy).

- Visitor demand: Approximately 2,000 daily (in 1993, the demand was 750,000 persons/year ~ 2055 persons/day)
- Number of cars entering the park per day in 2008: 780 veh/day. (x2.5 = 1950 persons/day)
- Contingency:
  - Chosen based upon judgment. Realistically, there will be slow days and erratic arrivals when smaller revenue will be generated:
    - Rainy day
    - Cold/winter day
    - Economic problems
    - Road closures
    - Etc.
  - Shuttle contracts will often be 3-5 years instead of as-needed.
- No allowance made for park operations outside of administrative position. For example, no lease fees were included for parking at the Princeville Center.
- No explicit knowledge of website operation/administrative costs. This is considered a "best guess."
- Note: The estimates provided below portray minimalist costs. The Kaua'i Bus and Speedishuttle both operate with costs of approximately \$20 per round trip, but might have higher contingency costs. Note also that the Kaua'i Busses operate with greater carrying capacity per bus.**

Five scenarios were considered:

##### Scenario 1: 900-person limit with no shuttle – (No shuttle).

**Scenario 2: 900-person limit with 50 stalls and shuttle** – Shuttle ridership is estimated to be 775 per day, with the other 125 arriving via vehicles using day-long parking passes; 6 vans necessary to operate continuously to meet this demand.

- Assumes that people will be beholden to the shuttle schedule, and that there will be 10 trips/day (arrivals can only occur during 9 of them).
- Carrying capacity:
  - 6 ADA Vans x 15 persons/trip x 9 trips/day = 810 persons/day > 775 2persons/day requirement.
- Cost
 

|                                                          |   |                            |
|----------------------------------------------------------|---|----------------------------|
| 6 vans @ \$920/day                                       | = | \$5,520                    |
| Administrator w/web startup @ \$610/day                  | = | \$610                      |
| Total                                                    | = | \$6,130/day                |
| Per rider @ 775 riders                                   | = | \$7.91/person/day          |
| With 30% contingency for low or sporadic ridership, etc. | = | <b>\$10.28 /person/day</b> |

**Scenario 3: 900-person limit without parking lot and with shuttle** – Shuttle ridership is estimated to be 900 per day; 7 vans necessary to operate continuously to meet this demand.

- Assumes that people will be beholden to the shuttle schedule, and that there will be 10 trips/day (arrivals can only occur during 9 of them).
- Carrying capacity:
  - 7 ADA Vans x 15 persons/trip x 9 trips/day = 945 persons/day > 900 persons/day requirement.
- Cost
 

|                                                            |   |                            |
|------------------------------------------------------------|---|----------------------------|
| ○ 7 vans @ \$920/day                                       | = | \$6,440                    |
| ○ Administrator w/web startup @ \$610/day                  | = | \$610                      |
| ○ Total                                                    | = | \$7,050/day                |
| ○ Per rider @ 900 riders                                   | = | \$7.83/person/day          |
| ○ With 30% contingency for low or sporadic ridership, etc. | = | <b>\$10.18 /person/day</b> |

**Scenario 4: Unconstrained with 50 stalls and shuttle** – It is estimated that approximately 2,000 visitors per day visit Hā'ena State Park. During our field investigation, 775 vehicles per day were counted entering the park. Fourteen vans would be necessary to operate continuously in order to meet this demand.

- Assumes that the number of visitors remains constant at 2,000/day minus 125 persons that arrive by vehicle, but will be beholden to the bus schedule; no additional capacity allowed for peak demand. In essence, this is  $1875/135 = 14$  vans.
- Cost
 

|                                                                                                        |   |                           |
|--------------------------------------------------------------------------------------------------------|---|---------------------------|
| ○ 14 vans @ \$920/day                                                                                  | = | \$12,880                  |
| ○ Administrator w/web startup @ \$610/day                                                              | = | \$610                     |
| ○ Total                                                                                                | = | \$13,490/day              |
| ○ Per rider @ 1,875 riders                                                                             | = | \$7.19/person/day         |
| ○ With 50% contingency for low or sporadic ridership, etc. (higher due to increased demand volatility) | = | <b>\$10.79/person/day</b> |

**Scenario 5: Unconstrained without parking lot and with shuttle** – It is estimated that approximately 2,000 visitors per day visit Hā'ena State Park. During our field investigation, 775 vehicles per day were counted entering the park. Fifteen (15) vans would be necessary to operate continuously in order to meet this demand.

- Assumes that the number of visitors remains constant at 2,000/day and will be beholden to the bus schedule; no additional capacity allowed for peak demand. In essence, this is  $2000/135 = 15$  vans.

- Cost
 

|                                                                                                        |   |                           |
|--------------------------------------------------------------------------------------------------------|---|---------------------------|
| ○ 15 vans @ \$920/day                                                                                  | = | \$13,800                  |
| ○ Administrator w/web startup @ \$610/day                                                              | = | \$610                     |
| ○ Total                                                                                                | = | \$14,410/day              |
| ○ Per rider @ 2,000 riders                                                                             | = | \$7.21/person/day         |
| ○ With 50% contingency for low or sporadic ridership, etc. (higher due to increased demand volatility) | = | <b>\$10.80/person/day</b> |

Table 5 compares the estimated costs to those of other transit services.

Table 5: Comparison of Estimated Transit Costs

| Name                                                                | Roundtrip<br>Cost/Passenger | Cost/Bus/12-hour |

\*Costs derived based on a ratio between Hā'ena State Park shuttle scenarios versus 12-hour cost per bus.

## V. CONCLUSIONS

Traffic along Kūhiō Highway along the roads leading to Hā'ena State Park is relatively light. However, minor queuing exists at the 1-way historic bridges between Princeville and Hā'ena State Park. It is estimated that the bridges operate at approximately 39 percent of capacity.

The Hā'ena State Park Master plan seeks to:

1. Limit the number of daily visitors to 900 per day.
2. Reduce the number of on-site parking stalls to a maximum of 100.
3. Consider providing a shuttle between Hā'ena State Park and Princeville as an alternative.

### Traffic Analysis

It is anticipated that the recommended improvements will reduce daily traffic through the 1-way historic bridges by as much as 35 percent during the critical PM peak hour of traffic, and improve operations along the 1-way historic bridges. Refer to Table 3 for a comparative analysis of the different scenarios.

### Shuttle

Implementation of Scenarios 2-5 would require the creation of a shuttle service between Princeville and Hā'ena State Park.

The shuttle would consist of 20-passenger vans that would operate continuously between 6:00 AM and 6:00 PM, with a round-trip duration of 70 minutes. The cost of this service is estimated at between 10 and 11 dollars per round trip. This is consistent with the estimated \$11.41 person/round trip cost for the Kaua'i Bus.

It would appear that all of the bridges along the shuttle route would have adequate capacity to handle the gross vehicle weights.

The effect of the shuttle and vehicle access restrictions to the park would be a reduction in traffic along Kūhiō Highway.

## VI. RECOMMENDATIONS

1. Implement scenarios 1, 2, or 3, described below. Options 4 and 5 are not recommended as they do not meet the objective of limiting the number of visitor arrivals to 900 persons/day.

**Scenario 1: 900-person limit with 100 stalls without shuttle** – It is recommended that parking passes be issued and that carpooling be encouraged.

**Scenario 2: 900-person limit with 50 stalls and shuttle** – Shuttle ridership is estimated to be 775 per day, with the other 125 arriving via vehicles using day-long parking passes; 6 vans necessary to operate continuously to meet this demand.

**Scenario 3: 900-person limit without parking lot and with shuttle** – Shuttle ridership is estimated to be 900 per day; 7 vans necessary to operate continuously to meet this demand.

2. Seek federal funding (if available) for the capital improvement costs.
3. (Scenarios 2-3) Install signage at the Princeville Park 'n Ride location to inform visitors that they must catch the shuttle to visit Hā'ena State Park unless they have obtained a parking pass in advance. Recommend that no entry tickets or parking passes be distributed at the park.
4. Require all persons, even those with annual passes to obtain entry ticket prior to entering Hā'ena State Park. This can be done through receipts, wristbands, or ticket stubs. This will prevent visitors from parking in surrounding communities or other nearby parking lots.

##### Use of Signal Optimization Tools in Work Zone Traffic Analysis

Signal optimization tools such as Passer, Synchro/SimTraffic, and Transyt 7F have a variety of applications for work zone analysis, especially in urban and suburban environments. Broadly speaking, these applications can be grouped in three categories:

1. Preparing timing plans for temporary signals used to manage traffic with in a construction site.
2. Adjusting signal timing on corridors that are directly impacted by construction.
3. Adjusting signal timing to improve progression on corridors that serve as alternate routes or detours around a work zone.

**Temporary Signals.** Figure 29 shows an example of the use of Synchro/SimTraffic to optimize the timing of a temporary traffic signal. In this case, two-way one-lane operation will be in effect during a bridge construction project (in other words, eastbound and westbound traffic will be sharing a single lane). Synchro's Ring/Barrier Editor was used to create a configuration that mimics the operation of the temporary signal by alternately sending eastbound and westbound traffic along the restricted section. Synchro's signal optimization algorithm was then used to establish a timing plan that minimizes traffic delays. The analysis also provides an indication of the extent of queuing on the approaches to the one-lane segment, which is useful in determining whether access to side roads will be blocked by queued traffic.

Figure 29 Synchro/SimTraffic Model of a Work Zone with Two-Way One-Lane Operation

\*Note the westbound vehicles queuing while eastbound traffic is allowed to proceed.

This method can also be used to evaluate the impact of work zone length on capacity and throughput for sites with two-way one-lane operations. As shown Figure 30, the capacity of two-way one-lane sections is sensitive to the length of the restricted section. Therefore, in many cases there is a trade-off between what is convenient for construction operations and what is acceptable in terms of traffic impact.

Figure 30 Capacity vs Length for Two-Way One-Lane Flagging Operations

**Adjusting Timing on Corridors Affected by Construction.** Normally, signal timing plans are developed based on the assumption that all of the lanes that exist at each intersection will be available for traffic to use. This assumption may not be true during construction. For example, take an intersection where two of the three lanes have been closed to traffic. In this case, all traffic is directed to use the right lane, severely impacting the capacity of the signalized intersection.

In such situations, to avoid excessive queuing and delay it may be necessary to make fundamental changes in the signal timing at individual intersections along an entire corridor. In the example shown in the photo, it may be desirable to increase the cycle length to compensate for the fact that left, thru, and right turning vehicles are sharing a single lane. To maintain good traffic progression along the corridor, signal offsets may need to be adjusted to account for reduced travel speeds. In addition, temporary changes in access to business properties along the corridor may affect turn patterns, requiring adjustments in signal phasing and splits. The use of a signal optimization tool allows all of these variables to be addressed comprehensively.

**Adjusting Timing on Parallel Routes.** The Daniel Webster Hoan Memorial Bridge carries Interstate 794 over the Milwaukee River in Milwaukee, Wisconsin. As shown in Figure 31, on December 13, 2000 there was a structural failure on one span of the bridge. The failure required immediate lane closures, resulting diversion of all traffic to other routes.

To accommodate increased traffic on the arterial street that runs directly parallel to I-794, the City of Milwaukee used signal optimization tools to prepare a revised traffic signal timing plan for the Kinross Avenue/First Street corridor (WIS 32). The revised signal timing plan was implemented less than 48 hours after the incident occurred (and at minimal cost). It increased the green time allocated to north-south thru traffic, and reduced the amount of time allocated to side streets. The revised signal timing is believed to have been instrumental in reducing traffic delays and minimizing the overall impacts of the bridge failure and subsequent reconstruction activities.

Figure 31 Structural failure on Daniel Webster Hoan Memorial Bridge, December 13, 2000.

## Appendix G

## I. INTRODUCTION

### A. Project Location and Description

Haena State Park is located on the north shore of Kauai, at the end of Kuhio Highway. It is bounded by the Na Pali Cliffs to the west, the base of Makana to the south, Limahuli Stream to the east and the Pacific Ocean to the north.

There are three (3) TMK parcels within the Park boundary. The parcel north of Kuhio Highway is identified by TMK 5-9-008:001 and encompasses approximately 52 acres. South of Kuhio Highway, parcels TMK 5-9-001:022 and 025 encompass approximately 180 acres.

The parcels identified by TMK 5-9-008:001 and 5-9-001:022, are owned by the State of Hawaii. The third parcel, TMK 5-9-001:025 contains the Kauluapaoa Heiau and Keahualaka hula platform, is owned by the County of Kauai and managed by the State Historic Preservation Division (SHPD), Department of Land and Natural Resources (DLNR). Haena State Park utilizes approximately 65.7 acres of the coastal area for recreational uses.

The Park experiences heavy usage throughout the week and is considered one of the highest utilized parks in the State. It is used by the public for picnics, snorkeling, swimming and hiking. It is estimated approximately 708,400 visitors experienced the many geological and cultural features of this unique park in 2007.

## II. EXISTING SITE CONDITIONS

### A. Soils

Based on Soil Survey of Islands of Kauai, Oahu, Maui, Molokai, and Lanai, State of Hawaii, five soil classes are present at Haena State Park. Its western coastline consists of Mokuleia fine sandy loam (Mr), while its northern coast is defined as Beach (BS). Marsh (MZ), Hanalei silty clay (HnA) and Hanalei silty clay with deep water table (HrB) are present further inland.

Beach soil extends up to 150 feet inland from the northern coast. This soil consists of light-colored sands resulting from the breakdown of coral and seashells.

Mokuleia fine sandy loam extends up to 800 feet inland from the western coast. Its surface layer contains 16 inches of fine sandy loam and its subsurface contains 34 to 48 inches of single-grain and loamy sand. This soil exhibits moderately rapid permeability in its surface layer and rapid permeability in its subsurface.

Marsh soil is present approximately 800 feet inland from the western coast of Haena State park. This soil type covers small, low-elevation areas where water

stands at the ground surface. Grasses, bulrushes and other herbaceous plants thrive in these areas.

Hanalei silty clay (HnA) soil is present in the western and inland portions of the Park. Its surface layer contains 13 inches of dark-gray, silty clay, of which the top 10 inches contain brown and red mottles. Its subsoil contains 13 inches of dark-gray and dark grayish-brown silty clay loam. The water table in this soil type is typically less than 3 feet below the ground surface. This soil experiences moderate permeability and is strongly acidic in its surface layer.

Hanalei silty clay with deep water table is present in the eastern and inland portions of the Park. This soil is similar to Hanalei silty clay; however it contains fewer mottles and is located in areas where the water table is greater than 3 feet below the ground surface.

Soil test borings and percolation tests were not performed specifically for this preliminary engineering report. Instead, the previously performed percolation test results at the existing comfort station are referenced to preliminarily size the disposal fields. A percolation rate of 4.14 minutes/inch was obtained in December 2009 for the constructed wetland project at the existing Ke'e comfort station.

### B. Topography

The ground elevation in the area north of Kuhio Highway ranges from approximately 70.0 feet above mean sea level (MSL) at the entrance to the Park to sea level at the coast line. This area is where the majority of recreational and cultural activity and usage is currently occurring as the area is relatively level.

The ground elevation south of the Kuhio Highway rises sharply with steep slopes and forms the cliffs of Na Pali, beyond the shoulder of the roadway.

The 100-year base flood elevation ranges from sea level to elevation 24.0 feet above MSL.

### C. Site Access, Roadways, Parking and Safety

Kuhio Highway is owned by the State of Hawaii, Department of Transportation (DOT) and provides the only access to and through Haena State Park. Prior to entering the Park, Kuhio Highway is a two lane roadway with gravel and AC pavement shoulders. Entry to the park requires crossing Limahuli Stream over a single lane, 10-foot wide x 12-foot long x 12-inch thick concrete bridge. Past the bridge, Kuhio Highway again becomes a two lane road, measuring approximately 24 feet wide, and continues approximately 0.5 miles to the end of the park at Ke'e Beach. The actual pavement structure within the roadway is not known, but is assumed to be a minimum of 2-1/2 inches of AC pavement over 8 inches of base course. It is in fair condition with some cracking and potholes in concentrated areas.

The paved shoulder lanes were added in 1985 under DOT Project No. 560A-01-86M, which resurfaced approximately 1.43 miles of Kuhio Highway. The guardrails were added in 2002 under DOT Project No. 560A-03-99 because the steep slopes on either side of Kuhio Highway and winding roads posed a threat to driver's safety. Kuhio Highway continues in an east-west direction through the southern portion of the Park until its termination at Ke'e Beach. The 2.0 foot shoulder pavement structure consists of a minimum of 1.5 inches of AC pavement over 6 inches of base course.

Figure 1: Haena State Park Entrance Crossing Limahuli Stream

Currently, pedestrian access to Haena State Park is limited. Within the Park, there are no pedestrian walkways along Kuhio Highway. Pedestrians typically walk on the side of the road or in the paved shoulder lane. However, there are many areas where rock slopes, vegetation, and/or guard rails force pedestrians to walk in the paved vehicular lanes.

Although a few hiking trails are scattered around the south areas of the site, there is only one marked pedestrian trail along the coast area traversing within the Park. It is an approximately 10-foot wide dirt trail beginning at the end of Kuhio Highway. The path is delineated with logs. The trail was intended to lead to other areas of the Park along the shoreline, but overgrown vegetation and fallen trees have blocked the path beyond the existing comfort station. Observations reveal visitors tend to walk in a direct path between the end of the paved road and the beach, in lieu of the dirt trail and do not venture into the overgrown areas.

Bicyclists encounter the same dangers as pedestrians due to similar reasons. There are currently no designated biking lanes or pathways in Haena State Park.

There are two authorized parking areas within Haena State Park, one approximately 800 feet from the entrance to the Park and one at the end of Kuhio

Highway. The parking lot near the entrance to the Park consists of a dirt and gravel clearing, approximately 30,000 square feet (sf) in area with a 12-foot wide driveway entrance from Kuhio Highway. The parking area is approximately 3.0 to 4.0 feet below the highway. Parking stall markings are non-existent and their absence causes inefficient usage of the designated parking areas. The parking area near Ke'e Beach is off-street parking, consisting of an approximately 10-foot wide cleared dirt strip to the north and south of Kuhio Highway. Although two parking areas are available, there is a shortage of parking stalls during high usage. Limited parking exacerbates the pedestrian and bicyclist safety problem. Currently, "No Parking" signs are present throughout Haena State Park along Kuhio Highway. However as parking fills up within the designated areas, visitors disregard posted signs and park in "No Parking" zones along the shoulder lanes. These vehicles force pedestrians to walk in vehicular lanes.

A helicopter landing area is currently located to the east of the gravel parking lot. The area is grassed, fenced and well maintained. Typically, it is used for emergency rescues and fires.

#### D. Drainage and Stormwater Management

The coastal areas of Haena State Park are located within the 100 year flood plain. Also, most of the Park is classified as estuarine and marine wetlands.

The only perennial stream within the Park is Limahuli Stream, but during periods of heavy rainfall, there are several intermittent streams flowing north through natural swales in the Park. During these times, storm water runoff is typically full of sediment, soil, stream fish, logs, plants and other debris material. The runoff creates a muddy plume at the stream outfall, but is part of the naturally occurring drain pattern in Haena State Park.

Drainage improvements on the site consist of five 18-inch RCP drain culverts that allow storm water to cross beneath Kuhio Highway from south to north. It is estimated approximately 56.8 cubic feet per second (cfs) and 37.9 cfs of runoff from approximately 14.2 acres above Kuhio Highway flows down Maunahou into the five culverts, during the 10-year and 2-year storm, respectively. See Appendix A for drainage calculations. Three 3'x4' drain inlets are located on the south edge of the roadway to collect runoff originating from the south and discharge through endwalls located along the north edge of Kuhio Highway. The other two culverts have concrete headwalls located on the south edge of the road and discharge through endwalls located immediately north of Kuhio Highway. The drain culverts satisfy the requirements set forth in the County of Kauai Department of Public Works Storm Drainage Standard.

The remainder of the site discharges stormwater runoff directly into the Pacific Ocean. It is estimated that approximately 7,300 cfs of runoff flows directly to the ocean during a 50-year storm. This includes the runoff from the west end of Maunahou that flows over Kuhio Highway and the entire area of the Park below Kuhio Highway. During heavy rain storms the entire Park is inundated with rushing waters from this surge of rainwater. The existing drainage improvements

do not have the capacity and were not designed to handle the larger storm events.

Figure 2: Typical Existing Drain Inlet along Kuhio Highway

Figure 3: Typical Existing Drain Outlet along Kuhio Highway with 3 Water Line and Telephone Lines

#### E. Water System

##### 1. Potable Water

The Kauai Department of Water provides potable water to the site through a 4-inch PVC water line that terminates at the entrance to the Park with a 1-inch water meter (Water Meter No. 083000140). Water is gravity fed from a 0.1 million gallon (MG) reservoir 1.1 miles away, located at ground elevation 126.5 feet above MSL. The spillway elevation is at 144 feet above MSL. In 1996, a standpipe pressure test was conducted by the Kauai Department of Water near Limahuli Stream. The test revealed a static pressure of 27 pounds per square inch (psi) and a 6 psi residual pressure at 103 gallons per minute (gpm) on the 4-inch pipe.

Within Haena State Park, a 3-inch galvanized iron pipe runs along the edge of Kuhio Highway in an east-west direction until its terminus at the Ke'e beach comfort station. Most of the 3-inch galvanized iron pipe within the Park is installed above ground. Buried pipe depths are unknown, but assumed to have a minimum cover of 3.0 feet. Existing 2-inch and 1-inch water laterals are assumed to have 1.5 feet of cover. At the parking lot entrance, the 3-inch water line is embedded under 1-inch of AC pavement.

Recorded water usage from October 2003 to November 2006 is documented to average 2,125 gallons per day (gpd).

At the comfort station, the existing water fixtures are currently being replaced under DLNR Job No. H10C663A with the following:

1. 2" PVC water lateral serving 3 water closets, 1 urinal, 2 lavatories, 1 drinking fountain with a drywell, and 2 hose bibs
2. 1" PVC water lateral serving an outdoor shower

These improvements were under construction in September 2008, but have since been completed. It is anticipated these new fixtures will decrease water demands by 4 gpm.

Figure 4: Ke'e Beach Comfort Station and Existing Leach Field Location

There is no fire protection water system within the Park. If needed, bucketing seawater is used. The last fire hydrant/standpipe on the potable water system is outside of the Park, 75 feet away.

##### 2. Non-Potable Water

A non-potable, irrigation, gravity fed HDPE pipe diverts an average of 760,000 gpd of water from Limahuli Stream. The diversion was installed south of Kuhio Highway and discharges into the taro patches north of Kuhio Highway and west of the parking lot. The irrigation water line begins as an 8-inch HDPE line at elevation 95.9 feet above MSL and transitions to a 6-inch HDPE line at elevation 57.5 feet above MSL. It crosses Kuhio Highway through one of the 18-inch RCP drain pipes.

#### F. Wastewater System

The original comfort station at Ke'e Beach was constructed in 1979 under DLNR Job No. 54-KP-11. It consisted of 3 water closets, 1 urinal and 2 lavatories. These fixtures drained into a 6.0 to 8.0 foot diameter cesspool, approved by DOH.

In 2001, the cesspool was replaced by a 2,500 gallon septic tank and approximately 2,700 square foot (sf) leach field located to the north and east of the comfort station. Record drawings for the construction of the individual wastewater system replacement were not available.

In 2008, the existing comfort station was demolished and replaced, under DLNR Project No. H10C663A. The new comfort station retains the same fixture count as its predecessor; 3 water closets, 1 urinal and 2 lavatories, which is estimated to generate 2,016 gpd.

The outdoor shower is located to the south of the comfort station. Greywater from the showers is allowed to drain and infiltrate into the surrounding soils.

In the Fall of 2010, the wastewater system for Ke'e Beach comfort station will be modified and upgraded to add a subsurface constructed wetland to further treat and improve water quality of the wastewater before discharging into the ground, at the request of the community. The planned system consists of 4-inch diversion valves and piping; 2-1,500 gallon primary treatment fiberglass tanks with battery-operated alarm control and panel; 968 sf of constructed wetland and 1,358 sf of infiltration field and appurtenances. The existing septic tank and leach field will continue to serve as an emergency backup system in the event the constructed wetlands system goes down.

Electric power is currently not available anywhere within Haena State Park and has been a limiting factor in the development of other wastewater treatment options.

In addition to the existing wastewater system for the comfort station, an abandoned cesspool was found at the old house site near Limahuli Stream. The existing Allerton House and Caretaker's cottage should also have abandoned cesspool(s). If any of these facilities are renovated the wastewater systems should also be upgraded or abandoned completely.

The comfort station renovation drawings call for the installation of a 30-inch diameter drywell to service a relocated drinking fountain near Ke'e beach. This drywell was not constructed as of September 2008.

#### **G. Electrical and Communication**

There is no electrical service currently available on-site. Service stops at the entry to the Park.

A ¾-inch telephone line runs along the same alignment as the 3-inch water line. It services a payphone and an emergency phone at the end of the Park, near the existing comfort station.

#### **H. Solid Waste**

Trash receptacles and recycle bins are available and maintained in the Ke'e beach area.

### **III. MASTER PLAN IMPROVEMENTS**

#### **A. Site Access, Roadways, Parking and Safety**

The Master Plan greatly improves the safety and experience of the Park for visitors by closing down Kuhio Highway beyond the existing parking lot. By allowing only emergency and maintenance vehicles beyond this point, pedestrians and bicycles can safely navigate the Park and enjoy its beauty without having to co-exist with vehicular traffic.

The proposed Plan also provided for a delineated parking areas and controlled access. The existing parking lot should be raised, leveled, stabilized and resurfaced with a pervious, geogrid surface to allow for drainage while not increasing runoff. It should be striped to maximize parking spaces and control traffic flow.

Well marked, stabilized pedestrian trails are proposed throughout the Park to provide access and visual appreciation to cultural sites, while protecting these significant sites from being disturbed. These trails, like the parking lot should be stabilized with a geogrid base.

The helicopter pad will remain where currently sited. No planned improvements are anticipated.

#### **B. Recommended Areas for Development**

Areas recommended for development are based on avoiding existing low-lying and coastal areas subject to flooding and utilizing areas where the terrain is sloped less than 10% to avoid massive excavation. These areas include:

- 1.) The 100-year flood zone, which reaches elevations of 18 feet along the coastline, and
- 2.) The coastal 10-year flood zone with wave velocity hazards, which reaches elevations of 21 feet.

In addition, interior areas with elevations less than 15 feet above mean sea level and areas adjacent to stream flood plain zones were eliminated.

However, the location of Limahuli stream within the previous Master plan and on TMK maps differs from the location shown on FEMA maps, the Kauai Online Hazard Assessment (KOHA) database, and the Hawaii National Flood Insurance Program (NFIP) database. The Department of Land and Natural Resources (DLNR) is currently working out this issue with the Environmental Protection Agency (EPA) Region 9. Until this issue is resolved, it is not recommended that development be considered in the vicinity of Limahuli Stream.

Figure 5 shows the limited area where these conditions apply and development can occur.

**E. Wastewater System**

The proposed wastewater system is discussed under a separate cover, Wastewater Preliminary Engineering Report for Haena State Park Master Plan, dated November 2010. Recommendations are summarized as follows:

During the community meetings, it was agreed that any proposed wastewater system should treat the wastewater effluent for potential reuse, to protect the grounds and surrounding environment of the Park from any on-site disposal. It is believed by being good stewards of the Park, the environment will be preserved for future generations.

Therefore, at a minimum, aerobic treatment units with absorption beds should be considered. Beyond this, water resource management and reuse options should be seriously taken into consideration during design.

Also discussed at the community meeting were the following to be considered in the design:

1. Providing R-2 water quality effluent at the Orientation and Cultural Center, with additional treatment for reuse.
2. Placing the absorption bed under the parking lot to provide separation of effluent from ground water and avoid contamination of the loi patches.
3. Providing aeration to the existing constructed wetlands primary treatment tanks through the use of a photovoltaic system.
4. Considering compost toilets only for low usage areas, if at all.

**F. Electrical and Communication**

Electrical service currently terminates at the entrance to Haena State Park. In order to provide electrical service to the new Orientation and Cultural Center, approximately 1,000 feet of overhead electrical line must be installed. Kauai Island Utility Cooperative (KIUC) provided a budgetary construction cost of \$33,000 to install 1,000 feet of 1-phase, 2-wire primary conductor that will service the Orientation and Cultural Center (cost is KIUC cost only and does not include connections to the building). 3-phase service terminates at Hanalei and is not feasible for this project.

Due to the winding nature of Kuhio Highway, overhead electrical poles will require anchoring at all corners. Easements will need to be granted to KIUC before the line extension can be executed.

We recommend overhead electrical power be extended from the Park entrance to the Orientation and Cultural Center. Beyond that point, photovoltaic systems and other sustainable power sources should be utilized.

**APPENDIX A  
CALCULATIONS**

# Kennedy/Jenks Consultants

By Michael Bungcayao Date 11/16/10 Project Haena State Park MP Project No. 1000711\*00

Checked By Ramon Sera Date 11/17/10 Sheet 1 3

## Find:

Flow entering the five (5) existing culverts, crossing Kuhio Highway within Haena State Park (2-year, 1-hour storm and 10-year, 1-hour storm)

## References:

- County of Kauai – Department of Public Works – Storm Drainage Standard, February 1972
- County of Kauai – Department of Public Works – Storm Drainage Standard, July 2001\*

\*Section references within calculations refer to the July 2001 edition unless otherwise noted.

## Assumptions:

- Run-Off coefficients (Attachment 2) were calculated from the February 1972 version for a conservative, representative estimate.
- Assume watercourse slope = 50%
- Intensity of the 10-year storm was calculated from the February 1972 version. Intensity of the 10-year storm not provided in Reference 2.

## Calculation:

Drainage Area = 14.17 Acres (Local Drainage System) [§ 1.7(m)]  
Although  $T_m = 2$  years per Reference 2, [§ 3.3(c)(1)]  
Q will be calculated for both  $T_m = 2$  years and  $T_m = 10$  years  
Also, Rational Method shall be used (Q = CIA) [§ 3.3(d)(1)]  
Where:  
Q = Flow Rate, in cubic feet per second  
C = Runoff Coefficient  
I = Rainfall Intensity, in inches per hour for a duration equal to time of concentration  
A = Drainage Area, in acres

Run-Off Coefficient, C (Attachment 2): [See Assumption 1]

For all zones –

|                                     |      |
|-------------------------------------|------|
| Moderate Infiltration               | 0.07 |
| Extreme Relief                      | 0.08 |
| Good Vegetal Cover                  | 0.03 |
| Agricultural                        | 0.15 |
| Total C = 0.07 + 0.08 + 0.03 + 0.15 |      |
| = 0.33                              |      |

Area, A (Attachment 1 and 1A):

|                                       |
|---------------------------------------|
| Zone 1 Area = 3.43 Acres              |
| Zone 2 Area = 4.05 Acres              |
| Zone 3 Area = 2.55 Acres              |
| Zone 4 Area = 1.76 Acres              |
| Zone 5 Area = 2.38 Acres              |
| Total Area = 3.43+4.05+2.55+1.76+2.38 |
| = 14.17 Acres                         |

Intensity, I: [§ 4.4.3]

Strip Length –

|                             |      |
|-----------------------------|------|
| Zone 1 Strip Length = 1,251 | Feet |
| Zone 2 Strip Length = 1,405 | Feet |
| Zone 3 Strip Length = 824   | Feet |
| Zone 4 Strip Length = 1,066 | Feet |
| Zone 5 Strip Length = 742   | Feet |

# Kennedy/Jenks Consultants

By Michael Bungcayao Date 11/16/10 Project Haena State Park MP Project No. 1000711\*00

Checked By Ramon Sera Date 11/17/10 Sheet 2 3

For All Zones –

Using Plate 1, (Attachment 3) –

First 300 feet of strip length, use *Forest with Heavy Ground Litter and Meadow*

Remaining Length, use *Grassed Waterway*

Velocity for first 300 feet = 1.8 feet per second

Velocity for remaining length = 11 feet per second

Time of Concentration,  $T_c$ :

Zone 1  $T_c = \frac{300 \text{ ft}}{1.8 \text{ fps}} + \frac{1,251 \text{ ft} - 300 \text{ ft}}{11 \text{ fps}} = 253 \text{ seconds}$

Zone 2  $T_c = \frac{300 \text{ ft}}{1.8 \text{ fps}} + \frac{1,405 \text{ ft} - 300 \text{ ft}}{11 \text{ fps}} = 267 \text{ seconds}$

Zone 3  $T_c = \frac{300 \text{ ft}}{1.8 \text{ fps}} + \frac{824 \text{ ft} - 300 \text{ ft}}{11 \text{ fps}} = 214 \text{ seconds}$

Zone 4  $T_c = \frac{300 \text{ ft}}{1.8 \text{ fps}} + \frac{1,066 \text{ ft} - 300 \text{ ft}}{11 \text{ fps}} = 236 \text{ seconds}$

Zone 5  $T_c = \frac{300 \text{ ft}}{1.8 \text{ fps}} + \frac{742 \text{ ft} - 300 \text{ ft}}{11 \text{ fps}} = 207 \text{ seconds}$

\*Minimum  $T_c = 300$  seconds (5 minutes)

Therefore for all zones,  $T_c = 5$  minutes

For All Zones –

Using Plate 2, (Attachment 3)

Intensity correction factor = 2.7

Intensity, I –

From Plate 3, (Attachment 4)

Intensity of 1-hr Rainfall for a 2 year storm = 3 inches

2-year storm corrected intensity = 3 inches \* 2.7  
= 8.1 inches

From Plate 1, (Attachment 4A)

Intensity of 1-hr Rainfall for a 10 year storm = 4.5 inches

10-year storm corrected intensity = 4.5 inches \* 2.7  
= 12.2 inches

Flow Rate, Q = CIA

Zone 1, 2-year storm flow rate =  $0.33 * 8.1 * 3.43$   
= 9.2 cubic feet per second

Zone 2, 2-year storm flow rate =  $0.33 * 8.1 * 4.05$   
= 10.8 cubic feet per second

Zone 3, 2-year storm flow rate =  $0.33 * 8.1 * 2.55$   
= 6.8 cubic feet per second

Zone 4, 2-year storm flow rate =  $0.33 * 8.1 * 1.76$   
= 4.7 cubic feet per second

Zone 5, 2-year storm flow rate =  $0.33 * 8.1 * 2.38$   
= 6.4 cubic feet per second

2-year, 1 hour storm – Total Flow in all 5 Zones =  $9.2 + 10.8 + 6.8 + 4.7 + 6.4$  cubic feet per second  
= 37.9 cubic feet per second

**Kennedy/Jenks Consultants**

By Michael Bungcayao Date 11/16/10 Project Haena State Park MP Project No. 1000711\*00

Checked By Ramon Sera Date 11/17/10 Sheet 3 3

Zone 1, 10-year flow rate =  $0.33 * 12.15 * 3.43$   
= 13.8 cubic feet per second

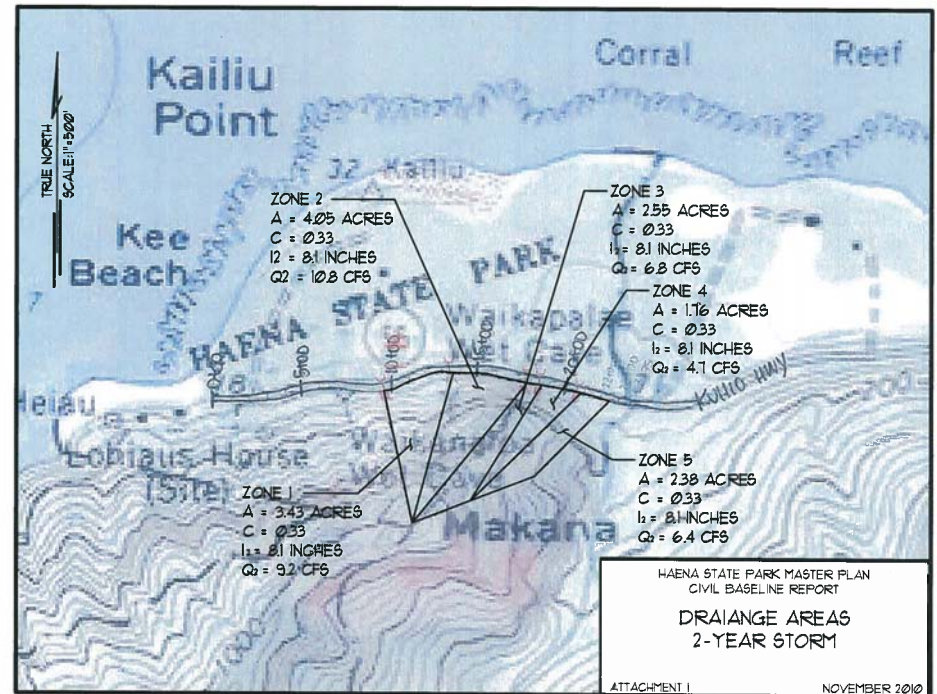

Zone 2, 10-year flow rate =  $0.33 * 12.15 * 4.05$   
= 16.2 cubic feet per second

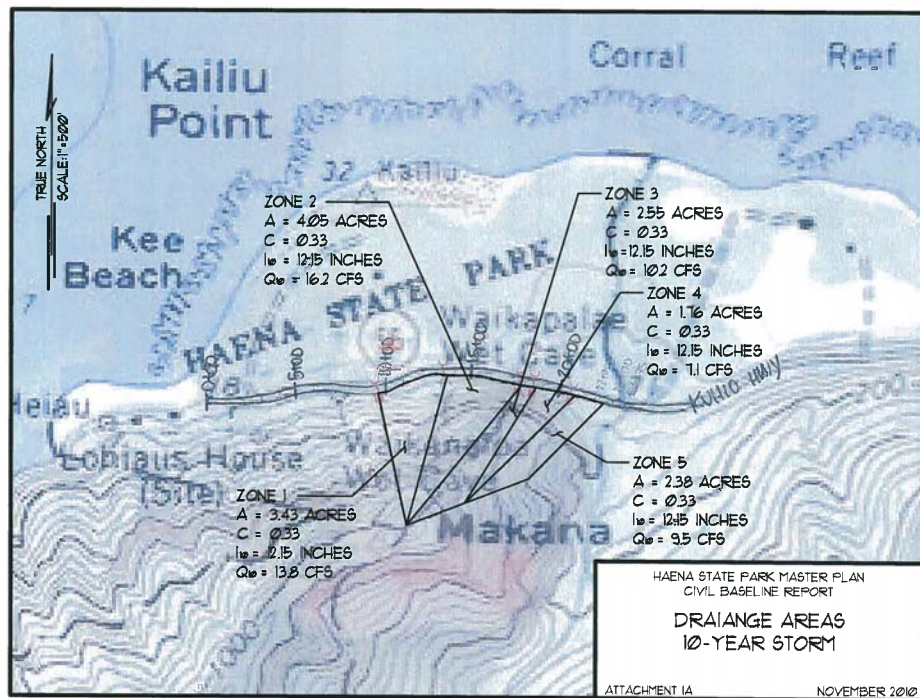

Zone 3, 10-year flow rate =  $0.33 * 12.15 * 2.55$   
= 10.2 cubic feet per second

Zone 4, 10-year flow rate =  $0.33 * 12.15 * 1.76$   
= 7.1 cubic feet per second

Zone 5, 10-year flow rate =  $0.33 * 12.15 * 2.38$   
= 9.5 cubic feet per second

10-year, 1 hour storm – Total Flow in all 5 Zones =  $13.8 + 16.2 + 10.2 + 7.1 + 9.5$  cubic feet per second  
= 56.8 cubic feet per second

**Table 1**

GUIDE FOR THE DETERMINATION OF RUNOFF COEFFICIENTS FOR BUILT-UP AREAS\*

| WATERSHED CHARACTERISTICS | EXTREME                       | HIGH                        | MODERATE                     | LOW                       |

## I. INTRODUCTION

### A. Project Location and Description

Haena State Park is located on the north shore of Kauai, at the end of Kuhio Highway. It is bounded by the Na Pali Cliffs to the west, the base of Makana to the south, Limahuli Stream to the east and the Pacific Ocean to the north.

There are three (3) TMK parcels within the Park boundary. The parcel north of Kuhio Highway is identified by TMK 5-9-008:001 and encompasses approximately 52 acres. South of Kuhio Highway, parcels TMK 5-9-001:022 and 025, encompasses approximately 180 acres.

The parcels identified by TMK 5-9-008:001 and 5-9-001:022, are owned by the State of Hawaii. The third parcel, TMK 5-9-001:025 contains the Kauluapaoa Heiau and Keahualaka hula platform and is owned by the County of Kauai and managed by the State Historic Preservation Division (SHPD), Department of Land and Natural Resources (DLNR). Haena State Park utilizes approximately 65.7 acres of the coastal area for recreational uses.

The Park experiences heavy usage throughout the week and is considered one of the highest utilized parks in the State. It is used by the public for picnics, snorkeling, swimming and hiking. It is estimated approximately 708,400 visitors experienced the many geological and cultural features of this unique park in 2007.

## II. EXISTING SITE CONDITIONS

### A. Soil

Based on *Soil Survey of Islands of Kauai, Oahu, Maui, Molokai, and Lanai, State of Hawaii*, five soil classes are present at Haena State Park. Its western coastline consists of Mokuleia fine sandy loam (Mr), while its northern coast is defined as Beach (BS). Marsh (MZ), Hanalei silty clay (HnA) and Hanalei silty clay with deep water table (HrB) are present further inland.

Beach soil extends up to 150 feet inland from the northern coast. This soil consists of light-colored sands resulting from the breakdown of coral and seashells.

Mokuleia fine sandy loam extends up to 800 feet inland from the western coast. Its surface layer contains 16 inches of fine sandy loam and its subsurface contains 34 to 48 inches of single-grain and loamy sand. This soil exhibits moderately rapid permeability in its surface layer and rapid permeability in its subsurface.

Marsh soil is present approximately 800 feet inland from the western coast of Haena State park. This soil type covers small, low-elevation areas where water stands at the ground surface. Grasses, bulrushes and other herbaceous plants thrive in these areas.

Hanalei silty clay (HnA) soil is present in the western and inland portions of the Park. Its surface layer contains 13 inches of dark-gray, silty clay, of which the top 10 inches

contain brown and red mottles. Its subsoil contains 13 inches of dark-gray and dark grayish-brown silty clay loam. The water table in this soil type is typically less than 3 feet below the ground surface. This soil experiences moderate permeability and is strongly acidic in its surface layer.

Hanalei silty clay with deep water table is present in the eastern and inland portions of the Park. This soil is similar to Hanalei silty clay; however it contains fewer mottles and is located in areas where the water table is greater than 3 feet below the ground surface.

Soil test borings and percolation tests were not performed specifically for this preliminary engineering report. Instead, the previously performed percolation test results at the existing comfort station are referenced to preliminarily size the disposal fields. Percolation rates test results of 4.14 minutes/inch were obtained in December 2009 for the constructed wetland project at the existing Ke'e comfort station.

### B. Topography

The Master Plan incorporates improvements and facilities north of Kuhio Highway and leaves the areas south of Kuhio Highway virtually untouched. The ground elevation in this area ranges from sea level to approximate 70.0 feet above mean sea level (MSL) at the entrance to the Park.

The ground elevation south of the Kuhio Highway rises sharply with steep slopes and form the cliffs of Napali beyond the shoulder of the roadway.

The 100-year base flood elevation ranges from sea level to elevation 24.0 feet above MSL.

### C. Wastewater System

The original comfort station at Ke'e Beach was constructed in 1979 under DLNR Job No. 54-KP-11. It consisted of 3 water closets, 1 urinal and 2 lavatories. These fixtures drained into a 6.0 to 8.0 foot diameter cesspool, approved by DOH.

In 2001, the cesspool was replaced by a 2,500 gallon septic tank and approximately 2,700 square foot (sf) leach field located to the north and east of the comfort station. Record drawings for the construction of the individual wastewater system replacement were not available.

In 2008, the existing comfort station was demolished and replaced, under DLNR Project No. H10C663A. The new comfort station retains the same fixture count as its predecessor; 3 water closets, 1 urinal and 2 lavatories, which is estimated to generate 2,016 gpd.

The outdoor shower is located to the south of the comfort station. Greywater from the showers is allowed to drain and infiltrate into the surrounding soils.

In the Fall of 2010, the wastewater system for Ke'e Beach comfort station will be modified and upgraded to add a subsurface constructed wetland to further treat and improve water quality of the wastewater before discharging into the ground, at the request of the community. The system consists of 4-inch diversion valves and piping; 2-

1,500 gallon primary treatment fiberglass tanks with battery-operated alarm control and panel; 968 sf of constructed wetland and 1,358 sf of infiltration field and appurtenances. The existing septic tank and leach field will continue to serve as an emergency backup system in the event the constructed wetlands system goes down.

Electric power is currently not available anywhere within Haena State Park and has been a limiting factor in the development of other wastewater treatment options.

In addition to the existing wastewater system for the comfort station, an abandoned cesspool was found at the old house site near Limahuli Stream. The existing Allerton House and Caretaker's cottage should also have abandoned cesspool(s). If any of these facilities are renovated the wastewater systems should also be upgraded or abandoned completely.

### III. DESIGN PARAMETERS

In 2001, The Keith Companies developed a Community Preferred Master Plan for Haena State Park. The Community Preferred Master Plan and all other alternatives discussed proposed two (2) restroom facilities. This included restoration and retrofit of the existing comfort station at Ke'e Beach and a new facility near the visitors center consisting of either chemical or compost toilets. In addition, the wastewater facilities for the caretaker's cottage and the DLNR Park's baseyard would have had to be considered although they were not specifically discussed in the report.

The 2010 revised version of the 2001 draft Master Plan consolidates any new facilities to a central area around the existing parking lot, thereby consolidating the wastewater treatment and disposal system. In addition, electrical power will be brought in to the existing parking lot to service the new visitors center and other facilities.

Based on the new concept and on-going community meeting discussions, the following parameters were used to evaluate wastewater alternatives and provided initial guidelines and recommendations.

#### A. Existing Comfort Station and other Wastewater Facilities

The existing comfort station at Ke'e Beach and its individual wastewater system consisting of primary treatment tanks, constructed wetlands and infiltration field will remain in service. Other existing wastewater system on existing facilities, specifically cesspools, will be abandoned and not utilized even if the facility it is serving is renovated. A new individual wastewater system will be required.

#### B. Wastewater Flow

The treatment and disposal of wastewater is regulated by the State of Hawaii Department of Health, under the Hawaii Administrative Rules (HAR) Title 11, Chapter 62. Because there is no public county sewer system in the area, the State Department of Health (DOH) regulates and oversee the wastewater system at Haena State Park.

The existing comfort station at Ke'e Beach is sized to handle 2,016 gallons per day (gpd) which currently handles the entire population of the Park. Any additional restroom facilities would help reduce and split this flow amongst the various restroom facilities.

As it is the goal of the community to limit the usage of the Park and protect its ecology, the 2,016 gpd of generated wastewater flow should be initially used as the estimated quantity for design. This equates to approximately 403 visitors per day, based on 5 gallon per person per day for picnic parks (toilet wastes only) per DOH standards.

#### C. Water Quality and Reuse

To use treated wastewater for any other use then disposal is regulated the "Guidelines for the Treatment and Use of Reclaimed Water", prepared by Hawaii State Department of Health (DOH), Wastewater Branch, May 15, 2002. In essence the DOH recognizes three (3) levels of recycled water, simply defined as follows:

**R-1 water**, the highest level of treatment is wastewater treated by oxidation to secondary effluent (Biochemical Oxygen Demand (BOD) <30, Total Suspended Solid (TSS) <30), then filtered to 2 NTU turbidity and disinfected with fecal coliform shall not exceed 2.2 per 100 ml using 7 days of results, 23 per 100 ml in more than one sample in 30 day period and 200 per 100 ml in any sample.

**R-2 water** is disinfected, secondary treated wastewater with effluent fecal coliform shall not exceed 23 per 100 ml using 7 days of results and 200 per 100 ml in more than one sample in a 30 day period.

**R-3 water** is an undisinfected, oxidized, wastewater effluent.

A summary of suitable uses for the various levels of treated wastewater is provided on Table 3-1 from their Guidelines, which can be found in Appendix A.

### IV. WASTEWATER TREATMENT ALTERNATIVES

The various possible wastewater treatment alternatives discussed below are summarized on fact sheets from the State of Hawaii, Department of Health, "On-Site Wastewater Treatment Survey and Assessment Study", January 2008. These fact sheets can be found in Appendix B.

#### A. Holding Tanks

Holding tanks do not provide any treatment, but also do not discharge treated wastewater effluent on-site. Holding vessels are sized to temporarily handle a few days' supply of wastewater and allow the pumper truck to periodically remove the wastewater from the Park.

Because of the remoteness of Haena State Park, narrow roadways and multiple one-lane bridges leading to the Park, this is not a very attractive option for pumper trucks and not economically viable.

## B. Waterless/Low Water Systems including Compost Toilets

Composting toilets have been implemented in unsewered, rural, and suburban areas for over 30 years. These toilets do not require water and process human waste with aerobic digestion in unsaturated conditions. If used correctly, solid waste is reduced to 10 to 30% of its original volume. However, it takes a long period of time to decompose before it is suitable for soil amendment. They are not meant for high usage. In addition, the waste material may have to be removed by a septage vacuum pump truck periodically, therefore the toilets should be placed in an area accessible to a truck.

Composting toilets are environmentally friendly if used correctly. They have been installed at various places in Kauai, including trails at Hanakapi'ai, Hanakoa, and Kalalau as well as at the adjacent, Limahuli Garden.

Two main types of composting toilets are available, one with the decomposition chamber attached to the toilet and one with the chamber separated from the toilet. Aside from the two main types, there are many composting toilet modifications available to facilitate the aerobic treatment process. Oxygen is required for an aerobic treatment process and a constant supply and concentration of oxygen will accelerate the treatment process. Also, odor reductions incurred by the modifications also reduce vector (pest) attraction to fresh waste. Some of the available modifications are as follows:

- a. Waste can be periodically separated into different containers based on its age, allowing older wastes to continue the process of decomposition without being contaminated by fresh waste. Urine is evaporated while aerobic digestion decomposes fecal material.
- b. Electric fans can be added to facilitate the aerobic digestion process within the decomposition chamber by exchanging gaseous by-products of aerobic digestion with oxygen from outside of the chamber. The addition of a fan will require electric power to the site.
- c. A mechanical device can be installed to churn decomposing material to ensure an adequate oxygen supply for aerobic bacteria. The addition of a churning device will require electric power to the site.
- d. Cover materials including saw dust, peat moss, rotted leaves, straw, grass clippings and other organic materials can be used to soak up liquid and eliminate odors. This method separates the urine from the feces and allows fecal decomposition to continue without odors. Cover materials must be restocked as needed and users are given the responsibility of maintaining them.
- e. Separate chambers for urine and feces will allow urine to undergo nitrification. This process turns urine into an odor free and nearly pathogen free liquid. Fecal matter will still decompose through aerobic digestion.
- f. In the absence of electric service, non-electric toilets or solar power can be used. Non-electric toilets are limited to 4 persons a day for vacation use and 2 persons a day for continuous use, assuming 3 uses per person every day. A solar panel can be installed to power a ventilation fan. Solar powered toilets are limited to 6

persons a day for vacation use and 4 persons a day for continuous use, assuming 3 uses per person every day.

Composting toilets have an expected service life of over 25 years. Installation can be moderately priced, depending on the type and number of composting toilets. For electric versions, there is a small daily electric cost associated with powering the fans and churning equipment. Power consumption for the fans and churners typically range between 365 to 3000 kWh/year.

## C. Septic Tanks

Septic tanks are the traditional way of disposing of on-site wastewater from remote locations. They are generally used to remove scum, grease and solids while providing some primary anaerobic treatment before discharge into the disposal system. Inert material, slow decomposing solids, grease and scum will accumulate in the septic tank and must be periodically removed. Septic tanks are sensitive to soaps, chemicals and large flows of water as the system relies on anaerobic bacteria growth to breakdown biological wastes. If the septic tank is upset due to these factors, wastewater will not receive normal treatment and effluent may shorten the lifespan of the disposal system.

There are two types of septic tanks available for commercial use, single chambered and double chambered. Both types of septic tanks rely on tank volume to provide wastewater detention times long enough to separation of solids from the wastewater flow. As wastewater influent enters the tank, its velocity is slowed to a rate where particles mixed with the water can settle out of the liquid either by sinking or floating. In a healthy septic tank, there are distinguishable sludge and scum layers on the bottom of the tank and on the water surface, respectively. A baffle on the effluent end of the septic tank allows clarified water, from between the sludge and scum layers in the tank, to drain into the disposal system.

Double chamber septic tanks are similar to single chamber tanks with the exception of a concrete separator that forces the wastewater to enter two chambers before leaving the tank. The first chamber typically utilizes the first two-thirds of the tank length and works similarly to a single chamber septic tank. Holes in the concrete separator at 40% the depth of the tank allows clarified water to enter the second chamber of the tank, while sludge and scum on the tank bottom and water surface are detained in the first chamber. The second chamber acts similarly to a single chamber septic tank, allowing some anaerobic treatment while remaining solids are allowed to separate from the wastewater. Much like the single chamber septic tank, a baffle is used on the effluent end of double chamber tanks. The result of using two chambers is a better quality effluent with less suspended solids that could "boil over" into the disposal system.

Commercial septic tanks in Hawaii are made of pre-cast concrete or fiberglass and are typically available in sizes between 750 and 5,000 gallons. Some sizes can be cast in Honolulu, but most must be shipped from the continental United States. Access to the site may be a limiting factor in the maximum size of tank provided.

Septic tanks have an expected service life of 50 years or more. The cost of installation and materials is moderate, depending on the type of tank and the site conditions present. Periodic maintenance costs include the removal of grease, scum and solids by a vacuum septic pump truck. Areas where septic tanks are installed must be accessible

by these trucks. Due to the differing conditions, some tanks may accumulate solids faster than others, making it difficult to determine a "rule-of-thumb" time period for pumping. Most public facilities should be initially pumped and monitored quarterly until a required frequency pattern is established.

#### D. Aerobic Treatment Units

Aerobic treatment units (ATU) are typically used when wastewater effluent quality must be higher than produced by septic tanks. ATU generally uses mechanical components to oxidize organic material, decrease suspended solids and reduce pathogens.

The standard aerobic treatment process consists of the following four stages:

- Solid Removal – A pre-loader receives wastewater from the building sewer before it reaches the aerobic treatment unit. The pre-loader works like a septic tank to remove solids from the wastewater flow.
- Aeration – After solid removal, the wastewater flows into the aerobic tank's first compartment, where mechanical blowers introduce oxygen into the compartment to fuel the aerobic treatment of biological waste.
- Settling – Wastewater then flows into the next compartment, where activated sludge are allowed to settle out of the wastewater.
- Disinfection – The final stage is an optional disinfection stage. This stage can be implemented or omitted depending on the quality of effluent required or preferred before disposal. Disinfection is typically accomplished through the use of chlorine tablets. Other disinfection options include liquid chlorine or ultra-violet (UV) light. By providing disinfection, R-2 water quality is achieved.

Aerobic treatment unit efficiency is dependent on temperature, tank geometry, tank material, concentration of solids, and type of mixing/aeration device. It is also, highly sensitive to changes in wastewater composition.

Aerobic treatment unit mechanical components have a service life of 10 to 20 years. They cost significantly more than septic tanks because of the higher material costs and extra equipment that must be installed with the aerobic unit. Also, there is a small daily electric cost associated with the aeration equipment, pumps and disinfection equipment. Power consumption for an aerobic treatment unit is typically 700 to 3,600 kWh/year.

A form of an aerobic treatment unit is a sequence batch reactor (SBR), with the characterizing difference of a single chamber used for all processes including equalization, biological treatment, and secondary clarification. It is a fill-and-draw activated sludge system that requires two or more reactors in a pre-programmed sequence of operation of at least 4 steps.

The SBR produces better effluent quality than septic tanks and aerobic units, but requires sophisticated equipment and higher levels of maintenance. Electrical power is required for this alternative. According to the EPA, the SBR uses approximately 1100 to 3650 kWh/year.

#### E. Centralized Wastewater Treatment Systems

In a centralized treatment system, waste from each facility are collected, treated and disposed of at a central location. This alternative may require some sites to install a small pump station to lift the wastewater to the central treatment plant, if located at a lower elevation than the treatment plant and are not able to be piped by gravity.

A conventional package treatment plant, like the ATU and SBR, is able to provide reliable, high quality secondary effluent and with continuous disinfection, at least R-2 water for reuse. With additional filtration and disinfection, these systems could produce R-1 water.

They are available in concrete, fiberglass and corrosion control coated steel. Experienced labor and a certified wastewater operator are required to maintain a package treatment plant due its sophisticated control system and monitoring and recordkeeping requirements. Electrical power is required for this alternative. Mechanical components for the treatment plant and lift stations have service life of 10 to 20 years.

#### F. Natural Systems including Constructed Wetlands

Of the natural treatment systems, a constructed wetlands system as being installed at the existing comfort station was evaluated for its cost effectiveness treatment. There are two (2) types of constructed wetlands used in the United States as briefly described in "Natural Systems for Wastewater Management and Treatment", by Reed, Crites and Middlebrooks:

"Free-water surface (FWS) wetland. In this type, the water surface is exposed to the atmosphere, the bed contains emergent aquatic vegetation, a layer of soil to serve as a root media, a liner if necessary to protect the groundwater, and appropriate inlet and outlet structures. The water depth in this type of wetland can range from a few centimeters to 0.8 meter or more, depending on the purpose of the wetland. Normal depth of 0.3 m (1 foot) is typical.

Subsurface-flow (SF) wetland. In this case the excavated basin is filled with a porous media, usually gravel and the water level is maintained below the top of the gravel. The same species of vegetation are used in both types of wetlands. In the SF case the vegetation is planted in the upper part of the gravel media. A liner is also used, if necessary to protect groundwater quality. The depth of the media is typical 0.3-0.6 m (1-2 feet)."

These systems require pretreatment to remove the solids before biological treatment. Aeration is also recommended to improve water quality, if possible. These systems generally require more land area than most on-site systems, require start-up periods to establish vegetation and may require backup systems for rainfall.

Currently, there are no regulations in Hawaii governing the construction and management of these systems and require special approval on a case by case bases from DOH.

## V. WASTEWATER DISPOSAL ALTERNATIVES

The various possible wastewater disposal alternatives discussed below are summarized on fact sheets from the State of Hawaii, Department of Health, "On-Site Wastewater Treatment Survey and Assessment Study", January 2008. These fact sheets can also be found in Appendix B.

### A. Absorption Bed

An absorption bed is the typical disposal system for individual wastewater systems, unless conditions require a smaller disposal area. Synonymous to the term leach field, it consists of leaching chambers placed on a level sub-grade surface. Traditionally, perforated pipe with gravel beds had previously been used, but is no longer preferred as it tends to clog and eventually lead to failure. Perforated pipe also provides a lower available detention volume than leaching chambers. The size of the absorption bed is dependent on the amount of flow and the soil percolation rate in the installation area.

This disposal system can be used with septic tanks, aerobic units, natural systems and as redundant, backup systems for wastewater treatment with reuse. As with any constantly used systems, suspended solids in effluent and bacteria in the soil will accumulate in the absorption bed until the soil can no longer handle its hydraulic loading. This failure usually occurs 20 to 30 years after installation. However, the leaching chambers make this system easier to maintain and rehabilitate.

### B. Seepage Pit

Seepage pits are not usually used unless special conditions warrant it. It is the preference of DOH to use absorption bed versus seepage pit for disposal as the absorption beds distributes the wastewater load over a larger area versus a concentrated discharge. Seepage pits are classified as underground injection wells in the State of Hawaii and may require yearly monitoring and sampling as determined by DOH.

Existing cesspools have been converted to seepage pits in cases where site area is limited and the groundwater table is not affected.

### C. Water Resource Management and Reuse

The Kauai Department of Water provides potable water to the site through a 4-inch PVC water line that terminates at the entrance to the Park with a 1-inch water meter (Water Meter No. 083000140). Within Haena State Park, a 3-inch galvanized iron pipe runs along the edge of Kuhio Highway in an east-west direction until its terminus at the Ke'e beach comfort station. Recorded water usage from October 2003 to November 2006 is documented to average 2,125 gpd. It should be noted these records are before the showers were installed. The average usage matches closely to the estimated wastewater generated.

A non-potable, 6-inch HDPE pipe diverts an average of 760,000 gallons per day (gpd) of water from Limahuli Stream to irrigate the loi (taro patches) field north of Kuhio Highway

and west of the parking lot.

Besides these 2 water sources, rainwater and natural springs provide water for the abundant plant life around the Park.

Depending on the quality of the treated effluent, use of the reclaimed water for various irrigation and other non-potable uses can be identified and implemented with the Master Plan based on the DOH Recycled Water Table 3-1. Consideration should be given to the following:

1. Reusing treated wastewater for the landscaping around the new Visitors Center, Maintenance Baseyard and Caretaker's Cottage.
2. Reusing wastewater and stormwater off the existing parking lot for toilet flushing at the Visitors Center to conserve water.
3. Reducing stream diversion by collecting, storing and using rainwater.
4. Capturing and storing rainwater for non-potable uses.
5. Using non-potable water for fire protection.

## VI. SUMMARY AND EVALUATION OF ALTERNATIVES

A matrix summarizing the various treatment alternatives advantage, disadvantage, impacts on the park and potential uses is provided on the following table.

Disposal options are limited and in this case dependent on the treatment option selected. In all cases where wastewater effluent disposal is on-site, an absorption bed will need to be provided.

## HAENA STATE PARK MASTER PLAN WASTEWATER TREATMENT ALTERNATIVE MATRIX

| ADVANTAGES                                          | HOLDING TANKS                                                                                                                                                                                                                                                                                       | COMPOSTING TOILETS                                                                                                                                                                                                                                                                                                                                                                                                                        | SEPTIC TANK                                                                                                                                                                                                                                                                                                                                                                                                                                                | AEROBIC TREATMENT UNIT                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | CONSTRUCTED WETLANDS (Subsurface Flow)                                                                                                                                                                                                                                                                                                           | GRAVITY SEWER AND PUMP STATIONS TO WASTEWATER PACKAGE PLANT FOR REUSE                                                                                                                                                                                                       | RECIRCULATING SAND FILTER FOR REUSE (not discussed in report)                                                                                                                                                                                                       |

## VII. RECOMMENDATIONS

During the community meetings, it was agreed that any wastewater system proposed treat the wastewater effluent for potential reuse, to protect the grounds and surrounding environment of the Park from any on-site disposal. It is believed by being good stewards of the Park, the environment will be preserved for future generations.

Therefore, at a minimum, aerobic treatment units with absorption beds should be consider. Beyond this, water resource management and reuse options as discussed hereinbefore should be seriously taken into consideration during design.

Also, specifically, discussed were:

1. R-2 water quality effluent be provided at the visitor's center, with additional treatment for reuse.
2. The absorption bed be placed under the parking lot to provide separation and avoid contamination of the loi patches.
3. Providing aeration to the existing constructed wetlands primary treatment tanks through the use of a photovoltaic system.
4. Compost toilets only be considered for low usage areas, if at all.

## APPENDIX A

### TABLE 3-1 SUMMARY OF SUITABLE USES FOR RECYCLED WATER

*(from Guidelines for the Treatment and  
Use of Recycled Water, May 15, 2002)*

**DISPOSAL ALTERNATIVES - FACT SHEETS**  
*(from On-Site Wastewater Treatment Survey  
and Assessment Study, January 2008)*

## Septic Tanks

## Fact Sheet P-1

A septic tank is a tank that serves as both a settling and skimming tank. Grit and other solids settle to the bottom of the tank and create a layer of sludge. Oil, grease, fat, and other floatables rise to the top creating a layer of scum. Accumulated sludge and scum must be removed on a regular basis; failure to do so will lead to carryover of these materials into downstream systems leading to their failure. Where site conditions indicate higher quality effluent is required, septic tanks are used as pretreatment for other treatment systems, including biological treatment systems.

Figure 5-2 Typical Double Chambered Septic Tank

### Considerations and Restrictions

A septic tank is purchased prefabricated, made of concrete or fiberglass, and it must meet the International Association of Plumbing and Mechanical Officials (IAPMO) material and property standards for prefabricated septic tanks. However, depending on site conditions, sometimes it is easier to construct a tank in-place. A constructed in-place septic tank must be designed in accordance with IAPMO specifications and stamped by a licensed structural engineer. Regardless of how a tank is constructed, it must be waterproof to prevent leakage and protected from corrosion in accordance with HAR 11-62, Subchapter 3.

The capacity of a septic tank is an important aspect in the treatment of wastewater prior to disposal. The required capacity of residential septic tanks can be referenced using HAR 11-62, Subchapter 3. The City and County of Honolulu "Design Standards of the Department of Wastewater Management" or the applicable county publication must be consulted.

A septic tank must be installed by a licensed contractor to comply with spacing and minimum distance requirements, as described in Chapter 3 of this document. Use of a septic tank requires the selection of a downstream disposal system (see Chapter 4).

Table 5-3 Summary of Advantages and Disadvantages of Typical Onsite Wastewater Treatment Systems

| Treatment System                      | Advantages                                                                                                                                                                                                                                                                                                                    | Disadvantages or Limitations                                                                                                                                                                                                                                                                                                                                                                                              |

| Chlorine Disinfection                 | <ul style="list-style-type: none"> <li>▪ No residual chemicals disposed in environment</li> </ul>                                                                                                                                                                                                                             | <ul style="list-style-type: none"> <li>▪ No residual chemicals disposed in environment</li> </ul>                                                                                                                                                                                                                                                                                                                         |
| UV Disinfection                       | <ul style="list-style-type: none"> <li>▪ No residual chemicals disposed in environment</li> </ul>                                                                                                                                                                                                                             | <ul style="list-style-type: none"> <li>▪ No residual chemicals disposed in environment</li> </ul>                                                                                                                                                                                                                                                                                                                         |

### Effluent Quality

In accordance with HAR 11-62, Subchapter 33, septic tank effluent must be discharged into a soil absorption system, a sand filter, a subsurface irrigation system (with director approval), or another treatment system. Septic tanks remove approximately 30% of BOD and 30% of TSS from typical domestic wastewater resulting in effluent quality of BOD ranging between 138 mg/L and 240 mg/L, and suspended solids in the range of 49 to 155 mg/L.

The DOH requires the installation of a screen on the effluent end of the septic tank to enhance solids removal and thereby prevent clogging of disposal systems. The effluent filter can be installed on the effluent tee on the inside of the septic tank, or in a separate structure outside the tank to facilitate access for required periodic cleaning, without which backups will occur.

### Typical Installed Costs (2007)

A 1,000-1,250 gallon residential septic tank costs approximately \$5,000-\$12,000 installed, including material, equipment, and labor. An effluent filter is about \$200-\$700 installed. The cost of a septic tank does not include the disposal system (see Chapter 4).

### Operation and Maintenance Costs

The decomposition rate of the solids that settle to the bottom of the tank and those that accumulate in the scum layer on the surface is slow, resulting in the accumulation of solids in the septic tank. Because of the accumulation of solids and scum, periodic pumping is required (every 2-3 yrs) to keep the tank functioning as designed and prevent solids from breaking and overflowing to the soil absorption system. The estimated cost for these pumping services range between \$150 and \$550 per visit. Assuming that the septic tank is pumped every 2-3 years, the equivalent cost is about \$50-\$200 per year. Pumping costs vary due to difficulty accessing the tank, haul distances, and limited pump truck capacity. Minimal use of kitchen sink grinders will help reduce the solids load, and extend the time between pumping of the septic tank and any downstream treatment units.

The effluent filter must be cleaned on a regular basis because of the growth of bacteria that will clog the filter. Frequency of cleaning is dependent on the size of the screen, environmental conditions, and type of wastewater entering the septic systems. Some manufacturers recommend cleaning every 1-3 years depending on level of use and site conditions. Cleaning consists of hosing off the filter into the septic tank and can be done by the homeowner.

#### Septic Tank Summary

|                                     |                             |
|-------------------------------------|-----------------------------|
| Meets NSF 40 Standards              | No                          |
| Effluent BOD:                       | 132-217 mg/L                |
| Effluent TSS                        | 49-161 mg/L                 |
| Removes 50% total influent nitrogen | No                          |
| Effluent Nitrogen:                  | 39-82 mg/L                  |
| Effluent Phosphorus:                | 11-22 mg/L                  |
| Effluent Fecal Coliform:            | 1,000,000 /100 mL           |
| Maintenance Level:                  | 2-3 yrs                     |
| Power Required:                     | No                          |
| Typical Installed Cost:             | \$5,000-\$12,000 /1,000 gal |

## **Waterless/Low Water Systems      Fact Sheet P-2**

Low water or waterless system is a broad, generic term given to a range of treatment systems that use little water or no water in collecting or treating human waste. It includes incinerating toilets, composting toilets, and chemical toilets.

Incinerating toilets use heat or combustion to degrade human waste into water, carbon dioxide, and ash. Incinerating toilets are one of a few treatment technologies that do not require a soil disposal system. However, the ash from the incineration must be disposed of, usually with municipal refuse in a landfill. Incinerating toilets may use natural gas, liquid propane, or electricity to incinerate the human waste, and are usually designed to handle only feces, urine, and paper. Ventilation for the toilet must be supplied.

Composting toilets receive human waste and stabilize it through natural degradation. The waste is mixed with starting mulch, and allowed to degrade and dehydrate for a period of up to 12 months, depending on usage. The composted material removed from composting toilets is suitable as a soil amendment, however, such use is restricted as described in HAR 11-62 in order to protect public health. The toilets come in automatic, semi-automatic, and manual versions. The automated models usually include heaters, ventilation fans, and a mechanical means to mix or aerate the compost.

Chemical toilets are toilets which have a chemical reservoir beneath them that catches the human waste. The chemicals in the toilet slightly disinfect the human waste and also provide a deodorant. Chemical toilets do not completely break down human waste and must be pumped frequently due to a very limited holding capacity. The contents of chemical toilets must be taken to a local wastewater treatment facility. The contents should not be poured into a home septic tank or aerobic treatment unit as the chemicals will have adverse effects on the biology of the treatment system.

### Considerations and Restrictions

Incinerating toilets are acceptable, long-term treatment systems, but they are typically only found in temporary or seasonal housing. The by-products (ash) must be periodically removed, but because it is sterile after incineration and poses no nutrient threat to the environment, it can generally be disposed of as household garbage. Without proper ventilation, odors may be generated (both from the human waste and the process of combustion.) Additional utilities are required (natural gas, propane, or electricity).

Composting toilets are also acceptable long term treatment systems, but are also an item typically only found in seasonal housing, campsites or other locations not occupied fulltime. Composting requires long periods of time to stabilize the human waste and may create odor problems. Those systems that do not use electricity for evaporative fans or mixing require more attention from the operator to maintain function. The produced compost is suitable as a soil applied fertilizer, but cannot be used for crops meant for human consumption, and its use is restricted by HAR 11-62.

Chemical toilets are a temporary means of treatment. The limited capacity and frequent pumping lend the system for uses that are of short duration, such as a few days. As anyone who has been to a large public gathering knows, chemical toilets are also a good augmentation to existing restroom facilities during short events or festivities.

## Suspended Growth Aerobic Treatment Systems **Fact Sheet B-1**

A suspended growth aerobic treatment system (one type of ATU) is a biological treatment system where microorganisms are kept in suspension by mixing air with wastewater influent and concentrated underflow or sludge (from a clarifier) in an aeration tank.

From the aeration tank, the mixture is passed into a settling basin (clarifier), where microorganisms settle to the bottom forming a layer of sludge. The liquid is passed to a disposal system or another process for additional treatment. Some of the sludge solids in the settling basin will undergo decomposition, while the remainder accumulates and must periodically be removed (pumped out) and properly/legally disposed of offsite.

**Figure 5-3 Continuous Flow, Suspended Growth Aerobic System with Settling Basins**

### Considerations and Restrictions

If the suspended-growth aerobic treatment system does not include an integral primary settling basin, a separate septic tank or pre-loader should be installed upstream of the aerobic treatment unit. The purpose of this additional tank is to remove readily settleable solids and floating matter that will reduce suspended solids loading and protect downstream mechanical equipment.

Consideration should be given to determine how best to use the existing grades to allow gravity flow from septic tank to aerobic treatment system to disposal system.

Power is needed to serve the blowers, pumps, controls, and monitoring and alarm systems in the ATU.

Use of a suspended-growth ATU requires the selection of a disposal system (see Chapter 4).

### Effluent Quality

Suspended-growth aerobic treatment systems can treat domestic wastewater and achieve effluent quality of BOD concentrations in the range of 5-50 mg/L and TSS concentrations of 5-60 mg/L. However, it should be noted that suspended-growth ATUs are not the most optimal to reduce nitrogen or phosphorus.

### Typical Installed Costs (2007)

Complete installation including materials, equipment and labor can range between \$20,000-30,000. This cost does not include the cost for a preloader/septic tank, if required, or the cost for a disposal system. See Septic Tanks (Sheet P-1) for a cost range for preloaders. See Chapter 4 for the costs of disposal systems.

### Operation and Maintenance Costs

Operation and maintenance costs are dependent on labor costs and electricity but range from \$400 to \$600 a year. Trained professionals should manage the aerobic system which should be inspected every 3-4 months with sludge/scum pumping performed as needed.

These systems are sensitive to high and low temperatures, heavy loading of solids, toxic chemicals (including chemical cleansers and the like), power failures, and influent flow variability.

### Suspended Growth Summary

|                                     |                                  |
|-------------------------------------|----------------------------------|
| Meets NSF 40 Standards              | Yes                              |
| Effluent BOD:                       | 5-50 mg/L                        |
| Effluent TSS                        | 5-60 mg/L                        |
| Removes 50% total influent nitrogen | No                               |
| Effluent Nitrogen:                  | 10-60 mg/L                       |
| Effluent Phosphorus:                | 4-18 mg/L                        |
| Effluent Fecal Coliform:            | 1,000,000 /100 mL                |
| Maintenance Level:                  | Quarterly                        |
| Power Required:                     | Yes                              |
| Typical Installed Cost:             | \$20,000-\$30,000 /1,000 gallons |

## Combined Attached and Suspended Growth Aerobic Treatment Systems

### Fact Sheet B-2

Combined attached and suspended growth systems are a type of ATU in which microorganisms form a slime layer on the surface of submerged or semi-submerged media. Treatment occurs as the wastewater passes over the microorganisms.

Figure 5-4 Combined Attached and Suspended Growth Reactor

#### Considerations and Restrictions

If the combined growth ATU does not include an integral primary settling basin, a separate septic tank or pre-loader should be installed upstream of the aerobic treatment unit. The purpose of this additional tank is to remove readily settleable solids and floating matter that will reduce suspended solids loading and protect downstream mechanical equipment.

Consideration should be given to determine how best to use the existing grades to allow gravity flow from septic tank to aerobic treatment system to disposal system. In addition, the system should be sited such that it can easily be accessed and inspected.

Use of a combined attached and suspended growth ATU system requires the selection of a disposal system (see Chapter 4).

#### Effluent Quality

Effluent BOD and TSS concentrations of 5-40 mg/L are expected from a combined growth system. Complete nitrification is expected (conversion of ammonia to nitrate) and phosphorus removal is expected to be between 10 and 15%.

#### Typical Installed Costs (2007)

Installation costs range from \$20,000 to \$30,000. This cost does not include the cost for a preloader, if required, or the cost for a disposal system. See Septic Tanks (Sheet P-1) for a cost range for preloaders. See Chapter 4 for the costs of disposal systems.

#### Operation and Maintenance Costs

Costs to operate combined growth ATU systems range from \$35-\$100 per year in energy, and management (pumping, inspection, and analysis) can cost \$100-\$200 per year. Energy consumption is on the order of 1-8 kW-h/day. Extended power outages will result in odorous conditions. Trained professionals should manage the ATU system which should be inspected every 3-4 months with sludge/scum pumping as needed.

These systems are sensitive to high and low temperatures, heavy loading of solids, toxic chemicals (including chemical cleansers and the like), power failures, and influent flow variability.

#### Attached and Suspended Growth Summary

|                                     |                                  |
|-------------------------------------|----------------------------------|
| Meets NSF 40 Standards              | Yes                              |
| Effluent BOD:                       | 10-30 mg/L                       |
| Effluent TSS                        | 15-60 mg/L                       |
| Removes 50% total influent nitrogen | Possible                         |
| Effluent Nitrogen:                  | 7-22 mg/L                        |
| Effluent Phosphorus:                | 2-10 mg/L                        |
| Effluent Fecal Coliform:            | 1,000,000 /100 mL                |
| Maintenance Level:                  | Quarterly                        |
| Power Required:                     | Yes                              |
| Typical Installed Cost:             | \$20,000-\$30,000 /1,000 gallons |

## Sequencing Batch Reactors (SBR)

## Fact Sheet B-3

A Sequencing Batch Reactor (SBR) is a form of ATU in which all of the aerobic and clarifying processes occur within a single tank. The tank may be constructed from concrete, fiberglass, or high-density polyethylene (HDPE). A SBR is designed to operate by sequencing through at least four (4) steps as follows:

- 1) **FILL:** tank is filled with wastewater to a predetermined volume or time;
- 2) **AERATION:** aeration is started with the suspended microorganisms in the wastewater;
- 3) **SETTLE:** aeration is turned off and the microorganisms settle to the bottom of the tank;
- 4) **DECANT:** decant the clarified portion as effluent.

After decanting, the cycle repeats with filling again. By allowing the tank water level to vary, providing influent stilling zones, and only decanting during aeration off cycles, these single-tank systems can be designed to operate continuously. Of great importance to the SBR process is the control system consisting of timers, level sensors, and microprocessors.

Figure 5-5 Cycles of an SBR / CBT

### Considerations and Restrictions

SBRs are a type of suspended-growth ATU that can oxidize BOD and provide both nitrification and denitrification (enhanced nitrogen removal). SBRs require power, control, and monitoring and alarm systems. SBRs have mechanical equipment (pumps, blowers, decanters) which must be properly maintained to ensure optimal operation.

Use of an SBR system requires the selection of a disposal system (see Chapter 4).

### Effluent Quality

Effluent from SBRs is of very good quality in terms of BOD and TSS. Typical ranges are from 5 -15 mg/L BOD and 10-30 mg/L of TSS.

SBRs will completely oxidize ammonia to nitrate via nitrification during the aeration cycle (aerobic cycle), and then facilitate nitrogen removal via denitrification during the settle and decant cycles (cycles that are anoxic). They can also provide enhanced biological phosphorus removal. The higher quality of effluent produced reduces the organic loading on the disposal system. SBRs also provide a consistent effluent, eliminating the fluctuations caused by varying influent loads.

### Typical Installed Costs (2007)

Equipment costs range from \$7,000-\$9,000 with installation costs of \$1,500-\$3,000 based on Mainland costs. Current costs to install in Hawaii are in the range of \$20,000 - \$30,000. This cost does not include the cost for a preloader, if required, or the cost for a disposal system. See Septic Tanks (Sheet P-1) for a cost range for preloaders. See Chapter 4 for the costs of disposal systems.

### Operation and Maintenance Costs

Annual energy costs are less than \$600 and pumping and inspection costs are greater than \$100. Trained professionals should manage the SBR system, which should be inspected every 3-4 months with sludge/scum pumping as needed. Homeowner neglect and/or interference can lead to operational malfunction. Alarms to warn of system failures are critical. Energy requirements are between 3 and 10 kW-h/day.

### SBR Summary

|                                     |                                  |
|-------------------------------------|----------------------------------|
| Meets NSF 40 Standards              | Yes                              |
| Effluent BOD:                       | 5-15 mg/L                        |
| Effluent TSS                        | 10-30 mg/L                       |
| Removes 50% total influent nitrogen | Yes                              |
| Effluent Nitrogen:                  | 7-45 mg/L                        |
| Effluent Phosphorus:                | 2-10 mg/L                        |
| Effluent Fecal Coliform:            | 1,000,000 /100 mL                |
| Maintenance Level:                  | Quarterly                        |
| Power Required:                     | Yes                              |
| Typical Installed Cost:             | \$20,000-\$30,000 /1,000 gallons |

## Packed Bed Reactors

## Fact Sheet B-4

A packed-bed reactor is an attached-growth biological treatment process that can be aerobic or anaerobic, upflow or downflow, continuous or intermittent dosing, single-media or multi-media and arranged in one or multiple stages. The most common prefabricated packed-bed reactor is an aerobic, down flow, continuous dosing, and continuous media type reactor. The packed-bed filter is a large excavation lined with an impermeable material that is filled with sand or other media placed over an underdrain. Wastewater is dosed at the top of the media bed, and allowed to percolate through the media (filter) to an underdrain. The aerobic biological treatment usually occurs in the first six inches of the filter surface, and chemical treatment, in the form of adsorption, occurs throughout the filter.

Packed bed reactors can be single pass (intermittent sand filters) or they can recirculate the effluent to treat the wastewater multiple times (recirculating sand filters or RSF). Ultimately, the effluent is discharged to a disposal system, similar to those discussed in Chapter 4.

Figure 5-6 Packed Bed Filter (Adapted from USEPA)

### Considerations and Restrictions

Sand filters are usually sized using hydraulic data, but consideration must also be given to the organic loading since it acts as a biofilm reactor. This type of system requires significant land area. Based on a typical application rate of 1-2 gallons per day per square foot (gpd/ft<sup>2</sup>), it will require 500-1,000 square feet for the treatment of 1,000 gpd.

Filters may need to be covered to ensure protection against accumulation of debris from the surrounding environment, algae fouling, and an increased hydraulic load from precipitation. Coverings may be as simple as a tarp canopy, which allows ample ventilation of the bed. Otherwise, the filter may be buried in the ground to provide protection and aesthetic concealment. Extra care must be given to filters buried in the ground to ensure ventilation of the bed. Mechanical aeration (blowers) may be required.

A pump station or recycle tank is required prior to the packed-bed filters to assist with equal distribution in the dosing pipelines across the media bed area.

Use of a packed bed system requires the selection of a disposal system (see Chapter 4).

### Effluent Quality

Effluent BOD is typically 5 mg/L and TSS is typically about 10 mg/L. Biological nitrogen removal is approximately 18-33%. Fecal coliforms are reduced by 99 to 99.99%.

### Typical Installed Costs (2007)

This cost includes the excavation, the media, the underdrain, and the dosing pump. The price range for media is \$10-\$15 per square foot of bed area. For a 250-1,000 square foot media filter, costs should range between \$15,000 and \$30,000. This cost does not include the cost for a preloader, if required, or the cost for a disposal system. See Septic Tanks for a cost range for preloaders. See Chapter 4 for the costs of disposal systems.

### Operational and Maintenance Costs

Operational costs include electricity for pumping and semi-skilled labor. Electrical costs can be estimated at \$20-30 a year at 0.3-0.4 kW-h/day, and management costs at \$150-200 per year. Every 3-4 months the filter should be inspected, and the top layer (1 inch) of media should be scraped off periodically (3 months-1 year) and properly disposed. Power outages affect the performance of sand filters, and extended outages may result in odors.

### Packed-bed Reactor Summary

|                                     |                                |
|-------------------------------------|--------------------------------|
| Meets NSF 40 Standards              | Yes                            |
| Effluent BOD:                       | 2-10 mg/L                      |
| Effluent TSS:                       | 3-16 mg/L                      |
| Removes 50% total influent nitrogen | Possible                       |
| Effluent Nitrogen:                  | 0.5-8 mg/L                     |
| Effluent Phosphorus:                | 3-12 mg/L                      |
| Effluent Fecal Coliform:            | 1,000 /100 mL                  |
| Maintenance Level:                  | Quarterly                      |
| Power Required:                     | No                             |
| Typical Installed Cost:             | \$15,000-30,000 /1,000 gallons |

## Chlorination

## Fact Sheet C-1

Chlorine is the most commonly used chemical and/or method for disinfection of water and wastewater, and has a long history of use in the US. Chlorine is effective against a wide range of pathogenic organisms. Common forms of chlorine include chlorine gas, solid or liquid chlorine (calcium hypochlorite and sodium hypochlorite), and chlorine dioxide.

Figure 5-8 Tablet Chlorination Chamber (Adapted from USEPA)

### Considerations and Restrictions

Gaseous chlorine is the most commonly used form; however, due to its highly corrosive nature and significant safety concerns, it is generally not recommended for onsite applications. Liquid hypochlorite solutions are commonly used at small treatment plants, where safety and simplicity are top priorities. Solid hypochlorite (powder or tablets) is common for onsite treatment systems (the same materials used for swimming pools and hot-tubs). All forms of chlorine are generally toxic and corrosive. They require careful handling and storage. The residual chlorine is effective as a disinfectant after the initial treatment. However, even at low concentrations, it can be toxic to aquatic life, and de-chlorination is necessary for discharges to (or impacting) surface waters.

### Effluent Quality

One advantage of using chlorine as a disinfectant is its ability to exist as a residual in wastewater effluent even after initial treatment. Chlorine has been shown to reduce fecal coliforms by 99-99.99%.

### Typical Installed Costs (2007)

A hypochlorite tablet feed system could cost \$800-\$1,000 for 1,000 gallons per day for the system itself. Labor and material costs vary depending on whether the tablet feeder is part of a pre-packaged system or added to an existing system. A gas chlorine system may cost \$75,000 to treat 100,000 gallons per day.

### Operation and Maintenance Costs

Operational costs for a tablet system are approximately \$30-\$50 per year for tablets, \$75-\$100 per year in labor, and \$15-\$25 per year in repairs and replacements.

Estimated cost for a gaseous chlorine system is approximately \$4,500 for chemicals, \$4,000 for labor, \$4,000 for power, and \$6,000 for materials.

Operating and maintenance cost and tasks include power consumption, cleaning, chemicals and supplies, repairs, and labor.

#### Chlorination Summary

|                                     |                              |
|-------------------------------------|------------------------------|
| Meets NSF 40 Standards              | NA                           |
| Effluent BOD:                       | - mg/L                       |
| Effluent TSS                        | - mg/L                       |
| Removes 50% total influent nitrogen | NA                           |
| Effluent Nitrogen:                  | - mg/L                       |
| Effluent Phosphorus:                | - mg/L                       |
| Effluent Fecal Coliform:            | 1000-10000 /100 mL           |
| Maintenance Level:                  | Quarterly                    |
| Power Required:                     | No                           |
| Typical Installed Cost:             | \$800-\$1,000 /1,000 gallons |

## UV Disinfection

## Fact Sheet C-2

Ultraviolet (UV) light is a physical disinfection agent that takes advantage of the germicidal properties of UV in the range of 240-270 nm. This radiation penetrates the cell wall of organisms, preventing reproduction. The effectiveness of UV disinfection depends on the characteristics of wastewater (particularly clarity as measured by turbidity), UV intensity, time of exposure, and reactor configuration.

Figure 5-9 Ultraviolet Radiation Chamber (Adapted from USEPA)

### Considerations and Restrictions

UV is effective in the inactivation of most viruses, spores, and cysts. UV eliminates the handling and storage of hazardous or toxic chlorine chemicals. However, UV performance is highly dependent on the quality of the wastewater it is disinfecting. High turbidity and total suspended solids will shield bacteria, making UV treatment ineffective.

### Effluent Quality

UV disinfection is lacking in field studies, but typical units treating sand filter effluents can reduce fecal coliforms by 99.9%.

### Typical Installed Costs (2007)

The component cost for a UV system is between \$1,000-\$2,000 per 1,000 gpd. Labor and material costs vary depending on whether the system is a built-in component of a packaged treatment system or added as an off-the-shelf component to enhance an existing system.

### Operation and Maintenance Costs

Annual power costs are \$35-\$45, labor \$50-\$100, and lamp replacement \$70-\$80 per year. Power consumption is about 35 W or 307 kW-h/y.

#### UV Disinfection Summary

## Constructed Wetlands Fact Sheet SF-5

A constructed wetland (CW) is a man-made, marsh-like area that is designed and built to provide wastewater treatment. A lined bed of washed gravel is planted with hydroponic species whose roots absorb nutrients and create areas for aerobic treatment to take place. CWs can be designed for discharge to SWIS and will require disinfection for reuse or discharge to surface or groundwater. CWs can be generally categorized into two categories: subsurface and free flowing or surface constructed wetlands. Subsurface wetlands are designed for fluid flow that is below ground level, whereas free flow wetlands allow for wastewater to approach the surface.

### Considerations and Restrictions

Wastewater pretreatment is required prior to the use of CWs. These operations include settling with a septic tank and/or screening mechanisms. CWs generally require more land space than other treatment methods, require a start-up period to establish the vegetation, must be designed such that rainfall runoff will not collect in the bed, and be designed to receive ample sunlight. Currently, there are no regulations in HAR 11-62 governing CWs, so the use of such systems requires approval. Safety issues and public access should be considered when designing and constructing CWs. Vector problems, such as mosquitoes, must be considered.

### Effluent Quality

The expected BOD and TSS removal can be 60-80% for BOD and 50-90% for TSS, but depends on the nature and characteristics of the influent. Removal of nitrogen can be effective. For the typical constructed wetland located at the Riveredge Nature Center, effluent quality for a system receiving 2,000-9,300 gpd of wastewater is about 3.7 mg/L of BOD, 17.2 mg/L of TSS, and fecal coliforms of 54 per 100 mL.

### Typical Installed Costs (2007)

According to the USEPA, a free flow, surface wetland should cost about \$2,000-\$4,000 per 1,000 gpd treated. However, for large disposal flows, the costs could approach \$15,000 per 1,000 gpd treated.

### Operation and Maintenance Costs

Operation and maintenance required for a CW is minimal and may include mosquito control. Occasional maintenance of the vegetation to promote growth of desired vegetation and maintaining hydraulic capacity is required. Proper maintenance of upstream processes is necessary to prevent clogging of the gravel bed.

#### Constructed Wetlands Summary

|                                     |                                 |
|-------------------------------------|---------------------------------|
| Meets NSF 40 Standards              | No                              |
| Effluent BOD                        | <10 mg/L                        |
| Effluent TSS                        | <20 mg/L                        |
| Removes 50% total influent nitrogen | Possibly                        |
| Effluent Nitrogen                   | <20 mg/L                        |

## Holding Tanks

## Fact Sheet D-1

A holding tank is a watertight concrete or plastic tank that receives either raw or treated wastewater and stores it until a pumping contractor can haul the wastewater away. Typically, holding tanks are used only as a temporary disposal system until a connection to a public system is established or an existing disposal system can be repaired or upgraded. The tank should be able to hold 2-3 days worth of storage, requiring a hauler to remove wastewater every other day before it becomes septic or overflows. Holding tanks are only allowed in public facilities.

### Considerations and Restrictions

Holding tanks must be structurally sound and must remain watertight. Holding tanks are considered a temporary system until a better system can be installed. Consideration should be given to providing venting for odor control and sizing of the tank to account for any gases that may be produced due to anaerobic reactions occurring in the tank. Alarms for overflow or strict monitoring of the holding tanks is necessary to prevent overflowing wastewater.

### Effluent Quality

If any treatment occurs, it is anaerobic in nature, producing odorous gases. No treatment can be assumed.

### Typical Installed Costs (2007)

Assuming the excavation and cost of the tank itself are the slightly higher than septic tanks, the cost of installing a complete holding tank is \$10,000-\$25,000.

### Operation and Maintenance Costs

Periodic pumping is required in order to prevent backups into the plumbing leading to the holding tank. For pumping up to 2 to 3 times per week, the cost would be \$1,600 -\$2,400 per month or \$19,200 to \$28,800 per year.

### Holding Tanks Summary

|                                                             |                                   |
|-------------------------------------------------------------|-----------------------------------|
| Use in Steep Terrain                                        | Any terrain                       |
| Use in High Ground Water Areas                              | Yes                               |
| Percolation Rate                                            | N/A                               |
| Relative Footprint When Compared To Conventional Drainfield | Small                             |
| Maintenance Level:                                          | High                              |
| Power Required:                                             | No                                |
| Typical Installed Cost:                                     | \$10,000 -\$25,000 /1,000 gallons |

**Table 4-3 Advantages and Disadvantages of Typical Disposal Systems**

| Disposal System     | Advantages                                                                                                                                                   | Disadvantages or Limitations                                                                                                                                                                                                                                                                                                                                                                      |

## Cesspools

## Fact Sheet D-2

Cesspools are generally large, cylindrical, lined excavations used to receive untreated wastewater. Solids are retained and the liquid percolates into the surrounding soil. A cesspool is either lined with rock, or constructed with mortar-less brick or perforated concrete rings. Cesspools are not considered a treatment system because virtually no treatment occurs that would protect the surrounding environment. Therefore, cesspools are considered to be only a disposal device.

Figure 4-1 Cesspool

### Considerations and Restrictions

New cesspools are severely restricted and prohibited in designated critical wastewater disposal area on all islands as defined in the HAR 11-62. New cesspools are currently still legal in specific areas of Hawaii County. Refer to the CWDA maps in Appendix C. Because of the slow decomposition rate, the solids in the wastewater will eventually clog the cesspool. The pores of the lining can be re-opened using caustic soda or a very strong acid. However, even these solvents will eventually fail to open the pores, and the cesspool will have to be closed and replaced.

### Effluent Quality

Effluent quality is only slightly better than the quality of raw wastewater as only large solids are removed from the wastewater. When used following a treatment system, no treatment is assumed and the cesspool functions as a seepage pit (see D-3).

### Typical Installed Costs (2007)

\$15,000 for excavation, lining and backfill.

### Operation and Maintenance Costs

The organic solids that settle to the bottom of the cesspool decompose at a very slow rate, resulting in accumulation of solids. Because of this accumulation, periodic pumping is required, ranging from \$150 to \$550 per visit, depending on site conditions and volume pumped.

#### Cesspools Summary

|                                                             |                               |
|-------------------------------------------------------------|-------------------------------|
| Use in Steep Terrain                                        | Yes                           |
| Use in High Ground Water Areas                              | No                            |
| Percolation Rate                                            | Designated by DOH             |
| Relative Footprint When Compared To Conventional Drainfield | Small                         |
| Maintenance Level:                                          | Low                           |
| Power Required:                                             | No                            |
| Typical Installed Cost:                                     | up to \$15,000 /1,000 gallons |

## Seepage Pits

## Fact Sheet D-3

The construction of a seepage pit is similar to that of a cesspool. The difference between the two is that the seepage pit receives treated wastewater, whereas a cesspool receives untreated wastewater. The effective absorption area of a seepage pit is measured along the sidewalls of the pit. No allowance is made for the bottom of the pit according to HAR 11-62.

### Considerations and Restrictions

Seepage pits should be considered when the land area available to dispose of effluent is insufficient for absorption beds/trenches, when the terrain is too steep for other disposal systems or when an impermeable layer overlies more suitable soil. Design criteria should be referenced in HAR 11-62.

Seepage pits are often found where cesspools once existed. The addition of a septic tank or other treatment system upstream from the cesspools enables the owner to consider converting the cesspool into a seepage pit, if the cesspool does not have any problems like spills or overflows. However, in cases where a new seepage pit is to be installed, it may be more expensive than other systems due to the greater depth of excavation. Seepage pits may also be sited such that they are below the aerobic zone in soil, resulting in little or no oxidation of organic compounds as compared to shallower systems such as absorption systems.

### Effluent Quality

There have been few studies that have investigated the effluent characteristics of seepage pits. It is commonly believed that seepage pits do not provide the same level of treatment as other disposal systems. However, in a 2007 study, it was shown that seepage pits in loamy soil eliminated E. Coli, a fecal coliform, from wastewater as well as absorption trenches did. Organic loads adjacent to the absorption trenches were actually higher than they were for the seepage pits. Effluent from seepage pits was also lacking in ammonia nitrogen, indicating effective nitrification. Total nitrogen was similar to background levels within six feet of the bottom of the seepage pits.

### Typical Installed Costs (2007)

Conversion of a cesspool into a seepage pit will cost approximately \$5,000. Installing a new seepage pit is much more expensive, depending on the soil conditions, but will generally cost approximately \$10,000 each. Multiple seepage pits may be required, depending upon site-specific percolation rates.

### Operation and Maintenance Costs

The overwhelming issue for seepage pits is not the maintenance of the pits themselves, but the maintenance of the treatment systems preceding the pits. Proper operation and maintenance of the septic tank(s) or ATU(s), extends the life of the seepage pit and decreases the likelihood of solids clogging in the seepage pit. If upstream processes allow passage of solids to the seepage pit, periodic sludge pumping will be required.

#### Seepage Pits Summary

|                                                             |                         |
|-------------------------------------------------------------|-------------------------|
| Use in Steep Terrain                                        | Yes                     |
| Use in High Ground Water Areas                              | Usually no              |
| Percolation Rate                                            | Faster than 60 min/in   |
| Relative Footprint When Compared To Conventional Drainfield | Small                   |
| Maintenance Level:                                          | Low                     |
| Power Required:                                             | No                      |
| Typical Installed Cost:                                     | \$10,000 /1,000 gallons |

## Absorption Beds

## Fact Sheet D-5

Absorption beds are subsurface wastewater infiltration systems (SWIS) that have beds at least three feet wide. Absorption beds are similar to absorption trenches. For an absorption trench system, there is a distinct section of undisturbed soil between the absorption trenches. With an absorption bed, the area designated for disposal is excavated, and a layer of gravel is installed with the distribution pipe laid atop. In the case of gravelless systems, the plastic chambers are laid on the exposed soil. In essence, the wastewater will be spread over the entire area, instead of restricted to beneath the distribution pipe.

Figure 4-3 Bed disposal system (Adapted from Kent County, DE DPW)

### Considerations and Restrictions

Beds are not allowed in terrain with slopes exceeding 8%. Since the entire area of the bed is considered as absorption area the total amount of land required is smaller compared to an absorption trench system. Roots from bushes and trees will damage the performance of the absorption system, therefore, root barriers should be utilized.

### Effluent Quality

Effluent quality from an absorption bed will be similar to that of absorption trenches (see D-4).

### Typical Installed Costs (2007)

These costs include excavation, gravel, piping, and/or plastic chambers/storage panels. Typical costs are about \$7,000-\$18,000 per 1,000 gpd of treated wastewater.

### Operation and Maintenance Costs

Operational and maintenance issues are the same as for trenches. See Appendix A for tips extending the functional life of SWIS.

#### Absorption Beds Summary

|                                                             |                                 |
|-------------------------------------------------------------|---------------------------------|
| Use in Steep Terrain                                        | <8% slope                       |
| Use in High Ground Water Areas                              | No                              |
| Percolation Rate                                            | Faster than 60 min/in           |
| Relative Footprint When Compared To Conventional Drainfield | Medium                          |
| Maintenance Level:                                          | Low                             |
| Power Required:                                             | No                              |
| Typical Installed Cost:                                     | \$7,000-\$18,000 /1,000 gallons |

## Elevated Mounds

## Fact Sheet D-6

Figure 4-4 Elevated Mound System

Elevated mound systems are engineered mounds of sand/soil used to create acceptable soil conditions for effluent disposal and/or to create vertical separation from groundwater. The land on which the mound will be placed is first tilled, and a layer of sand and distribution system is placed over the tilled surface. The top of the mound is covered with surrounding soil and aesthetically landscaped.

### Considerations and Restrictions

Mounds are commonly used in areas where absorption trenches and beds cannot be used, such as when the terrain is excessively steep, when there is a high groundwater table, or when the soil percolation rate is not conducive for a SWIS. Landscaping is required as the mounds could reach a height of three feet. As shown in the figure above, the disposal point is higher than the treatment system, therefore a pump system will be required.

### Effluent Quality

Effluent quality for an elevated mound system is similar to that of an absorption trench or bed (see D-4).

### Typical Installed Costs (2007)

Construction costs range from \$10,000 to \$15,000, but can go as high as \$25,000 per 1,000 gpd of treated wastewater in Hawaii.

### Operation and Maintenance Costs

Since the elevated mound system requires a pump to lift the effluent to the specific elevation, the pump's power costs need to be budgeted. The estimated power consumption is approximately 100 - 300 kW-h per year. The same care must be provided to the mound as would be provided to trenches or beds. See Appendix A for tips on maintenance.

#### Elevated Mounds Summary

|                                                             |                               |
|-------------------------------------------------------------|-------------------------------|
| Use in Steep Terrain                                        | Yes                           |
| Use in High Ground Water Areas                              | Yes                           |
| Percolation Rate                                            | All                           |
| Relative Footprint When Compared To Conventional Drainfield | Large                         |
| Maintenance Level:                                          | Medium                        |
| Power Required:                                             | Yes                           |
| Typical Installed Cost:                                     | up to \$25,000 /1,000 gallons |

## Evapotranspiration

## Fact Sheet D-7

Evapotranspiration (ET) is the combined effect of wastewater disposal by direct evaporation and by plant transpiration. ET is the discharge of pretreated effluent to a porous bed containing water-tolerant plants. Wastewater effluent is discharged into the bed, and wicking or capillary action draws the water to the surface where it is either taken up by the plants and transpired or evaporated from the surface of the bed. These systems may or may not be designed with an impermeable liner. If the system is designed with a liner, the system is considered "zero-discharge", and disposal is strictly dependent on transpiration through the plants and evaporation. However, if the liner is not used, the disposal system sizing criteria can also account for absorption via the soil. This type of system is known as evapotranspiration-infiltration (ETI). ET and ETI require large surface areas for year round disposal and are most suited for very arid climates where evaporation rates are much higher than precipitation rates.

Figure 4-5 Cross Section of an ET Bed

Typical components of an ET system may include drip or distribution lines, a flushing and filtering mechanism, a controller to automate the dosing cycles, a distribution pump, and several alternating drainfields. DOH approves these systems on a case-by-case basis, and systems exist in the State of Hawaii. Record keeping of lysimeter (soil pore water sampler) data is required to ensure that this alternative system is operating effectively.

### Considerations and restrictions

These systems are considered non-standard/alternative systems by DOH. Evapotranspiration is best suited for environments where the rate of evaporation significantly exceeds the rate of precipitation. Zero discharge systems, like evapotranspiration, that prevent wastewater from leaving the site (and/or reaching groundwater) can be used above the UIC line, pending approval from DOH on a case-by-case basis. Other considerations include:

- Stormwater runoff should drain away from the system. Gutters and drainpipes shall be directed away from the system.
- Use high transpiration plants suitable for the wetness at ground level.
- Consider additional ET/ETI beds as required to enable owner to deal with operating difficulties or system failures and alternate loads.

Figure 4-6 Subsurface Evapotranspiration Profile of Typical ET System

### Effluent Quality

Few studies have adequately quantified the quality of the effluent from this disposal system. Trial and error has been the norm for these types of systems, so success rates are very hard to determine, as well as quality of effluent.

### Typical Installed Costs (2007)

Because of the large surface area used, ET/ETI systems can be expensive. Values can range between \$15,000 and \$25,000 per 1,000 gpd of treated wastewater.

### Operation and Maintenance Costs

Operational costs are on the order of \$20 a year for simple inspection of observation wells, plus electrical costs for pumping when needed. Other maintenance requirements include minor landscape work, such as trimming the vegetation. Upstream treatment operations and processes should be properly maintained and pumped as needed to avoid overflow of solids into the ET bed.

### Evapotranspiration Summary

|                                                             |                               |
|-------------------------------------------------------------|-------------------------------|
| Use in Steep Terrain                                        | No                            |
| Use in High Ground Water Areas                              | Yes                           |
| Percolation Rate                                            |                               |
| Relative Footprint When Compared To Conventional Drainfield | Large                         |
| Maintenance Level:                                          | High                          |
| Power Required:                                             | Yes                           |
| Typical Installed Cost:                                     | up to \$25,000 /1,000 gallons |

The reuse of wastewater for non-potable needs can offset potable water use thereby reducing overall demand on the potable water supply. Therefore, water reuse or reclamation has become increasingly popular. If an effluent meets certain Department of Health water quality requirements, then the recycled water can be utilized in landscaping, agricultural irrigation, and even toilet flushing.

The highest level quality of recycled water defined by DOH is R-1, and is the only level of recycled water that may be used above the UIC line, on a case-by-case basis. The requirements for R-1 recycled water are quite strict and fairly expensive to achieve with a small flow onsite treatment system. However, the requirements for R-2 and R-3 water are less stringent making recycling of effluent less difficult.

**Considerations and Restrictions**

Care should be taken to ensure that there is no crossing of recycled water lines and potable water lines. Distinguishing markings (standard purple pipe) should be used to identify recycled water lines. Strict monitoring and record keeping are required. The frequencies and types of parameters to be monitored are determined by the level of effluent quality and the method of application of the recycled water. Daily, weekly, and annual records of the treatment and water reuse project may be required. The State of Hawaii Department of Health has published *Guidelines for the Treatment and Reuse of Recycled Water*, available at the DOH website <http://www.hawaii.gov/health/environmental/water/wastewater/forms.html>. These guidelines will help in the planning and design of any wastewater recycling system. The frequency of monitoring and reporting may be reduced for on-site systems by DOH on a case-by-case basis.

**Effluent Quality**

Recycling of water does not improve the quality of the effluent, but it does have minimum standards that must be met to be safe for human health and the environment.

**Typical Installed Costs (2007)**

The costs associated with the specific concept of recycling water are too specific to give a general price range

**Operation and Maintenance Costs**

Without a definitive concept of a proposed system, operation and maintenance costs cannot be generalized.

**Wastewater Reuse Summary**

|                                                             |                 |
|-------------------------------------------------------------|-----------------|
| Use in Steep Terrain                                        | Approval needed |
| Use in High Ground Water Areas                              | Possible        |
| Percolation Rate                                            | All             |
| Relative Footprint When Compared To Conventional Drainfield | Unknown         |
| Maintenance Level:                                          | Unknown         |
| Power Required:                                             | Unknown         |
| Typical Installed Cost:                                     | Unknown         |
