

Hawaiian hoary bat monitoring

Marcos Gorresen — Hawai'i Cooperative Studies Unit — UH Hilo

Jack Jeffrey

Proposed and on-going research

- Reforestation mitigation assessment
- Video monitoring of bat activity & behavior
- Bat density and population size estimation

Completed monitoring study

- Bat activity & behavior at wind turbines

Reforestation and habitat enhancement

does mitigation offset bat take?

does reforestation affect bat habitat quality?

insect prey availability and bat use

- assess insect biomass and composition
- assess bat activity rates and behavior
- compare land-cover types
- sample at landscape scale

pasture

pasture with
relict large trees

mature forest
with recovered
understory

20 - 25 year
reforestation

- same elevation range
- same precipitation range & climate zone

5 km

**20 - 25 year
reforestation**

1 km

with recovered
understory**

1 km

pasture

1 km

An aerial photograph of a landscape, likely a wetland or coastal area. The terrain is characterized by a complex pattern of light green and tan/brown patches, suggesting different vegetation types or soil conditions. A prominent, dark, irregular line runs diagonally across the center, possibly a water body or a boundary. In the top left, there is a small, dark, rectangular feature, possibly a building or a small pond. The bottom right corner features a white scale bar labeled '1 km'. The word 'pasture' is written in white text in the top right corner.

malaise / light trap

thermal camera

acoustic detector

alternating
horizontal and
vertical profiles

regular time
intervals

detection range:
insects $\approx 500\text{m}$
bats $> 1\text{km}$

pasture

pasture with
relict large trees

mature forest
with recovered
understory

20 - 25 year
reforestation

5 km

Video monitoring of bat activity & behavior

*thousands hours of recordings....
what's that speck?*

- USGS-FORT and National Renewable Energy Laboratory
- open-source software tools for surveillance video
- computer-vision with machine learning
- automate real-time detection, classification, tracking and counting of flying animals against dynamic backgrounds (clouds and moving turbine blades)
- publication later in 2020 & further development (e.g., NABat)
- long-term monitoring, deterrent tests, and offshore application

Bat density and population size estimation

how many bats are there?

generate multiple local density estimates

extrapolate to habitat area

- density estimation with “camera trapping” (thermal video or acoustic detectors)
- random encounter model (REM), space to event (STE)
- unmarked animals (no info needed on number or identity tracking)

Camera trap

Video monitoring of bat activity & behavior

Milchram et al. 2020. Estimating population density of insectivorous bats based on stationary acoustic detectors: A case study. Ecology and Evolution.

.... *but how to validate model estimates???*

Applied REM model to video detections → estimated 2 to 8 bats/km²

→ validate with radar sampling of targets within ~1 km radius

- identify habitat strata
- spatially balanced design
- large oversample
- paired thermal video and acoustic detector
 - correlation → correction for acoustic-only samples in follow-up studies

Video and acoustic monitoring of bat activity & behavior at wind turbines

Hawaiian hoary bat (*Lasiurus cinereus semotus*) behavior at wind turbines on Maui. Gorresen et al. In review. Technical Report HCSU-093
<https://doi.org/10.5066/P937H9LQ>

Objectives

- *investigate behavior of bats interacting with turbine*
 - *relationship of bat activity and wind speed*
- *reliability of acoustic monitoring to determine presence*

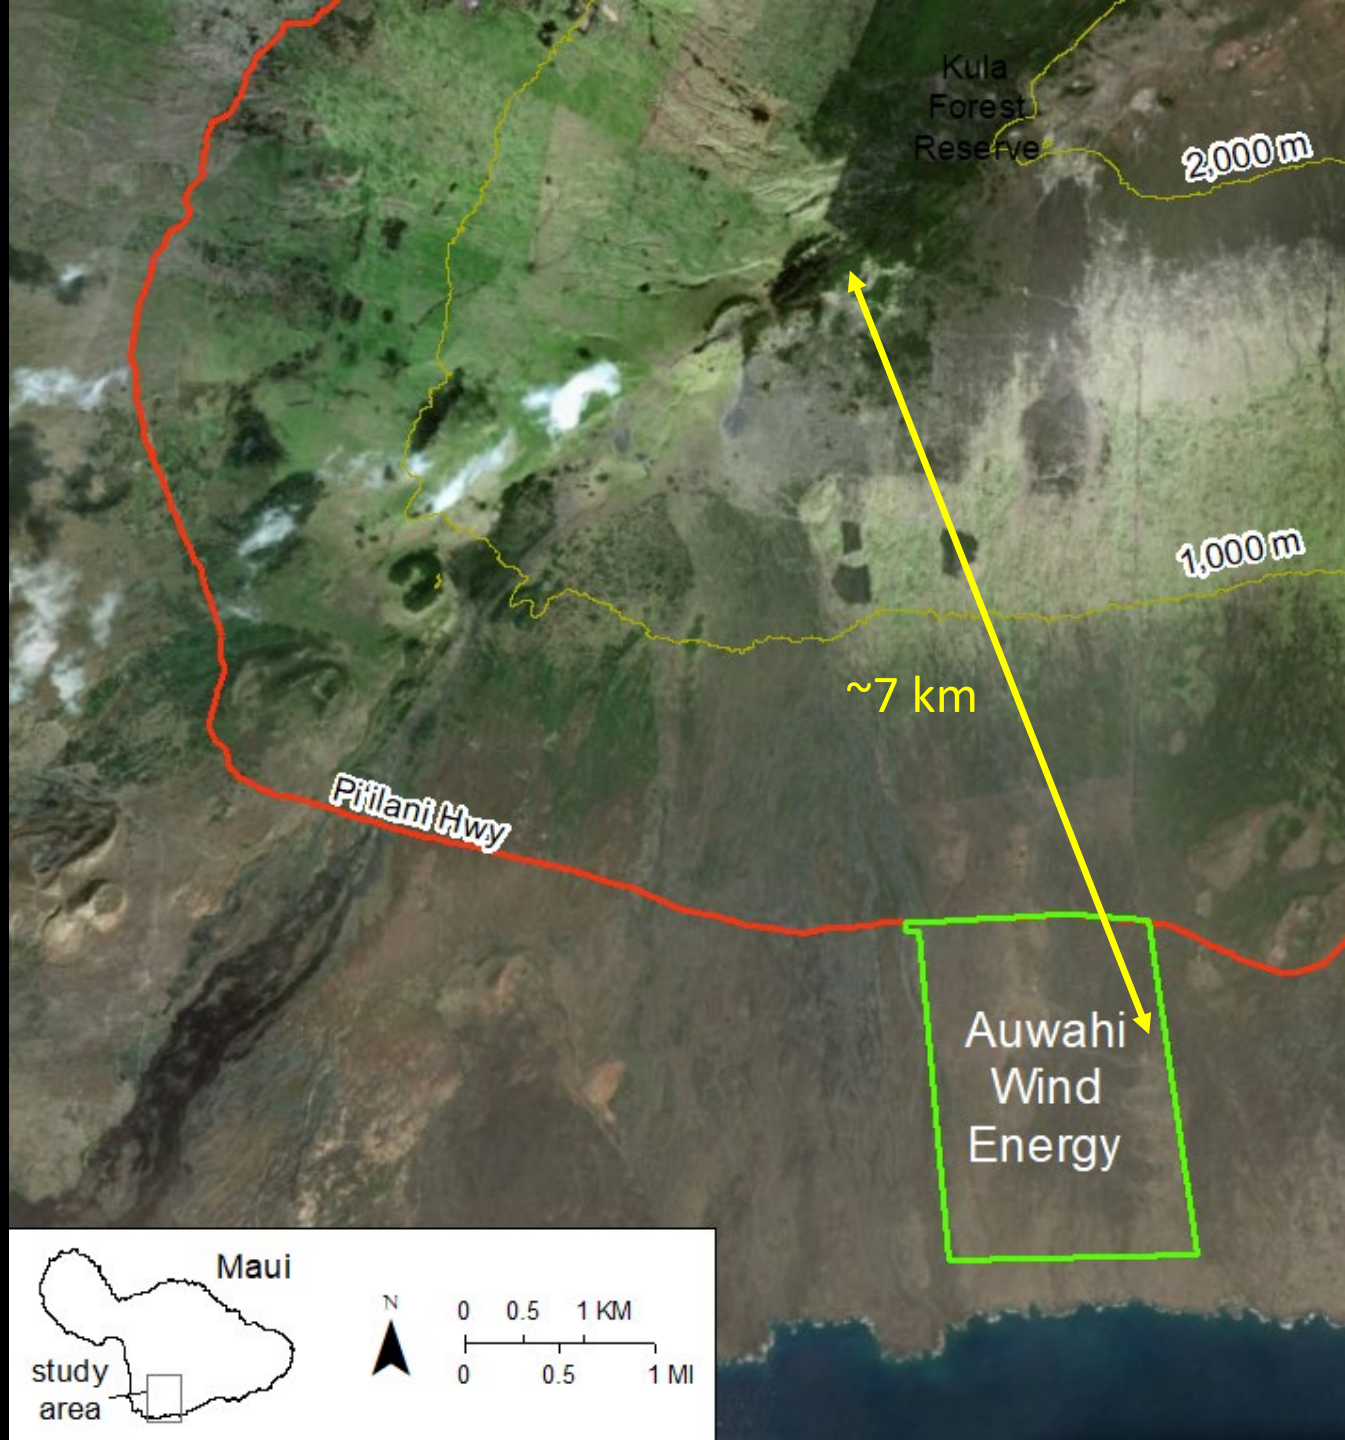

southeast Maui
Auwahi Wind Energy

4 turbines
August – November
2018

Video
412 turbine-nights
(5,000 hours)

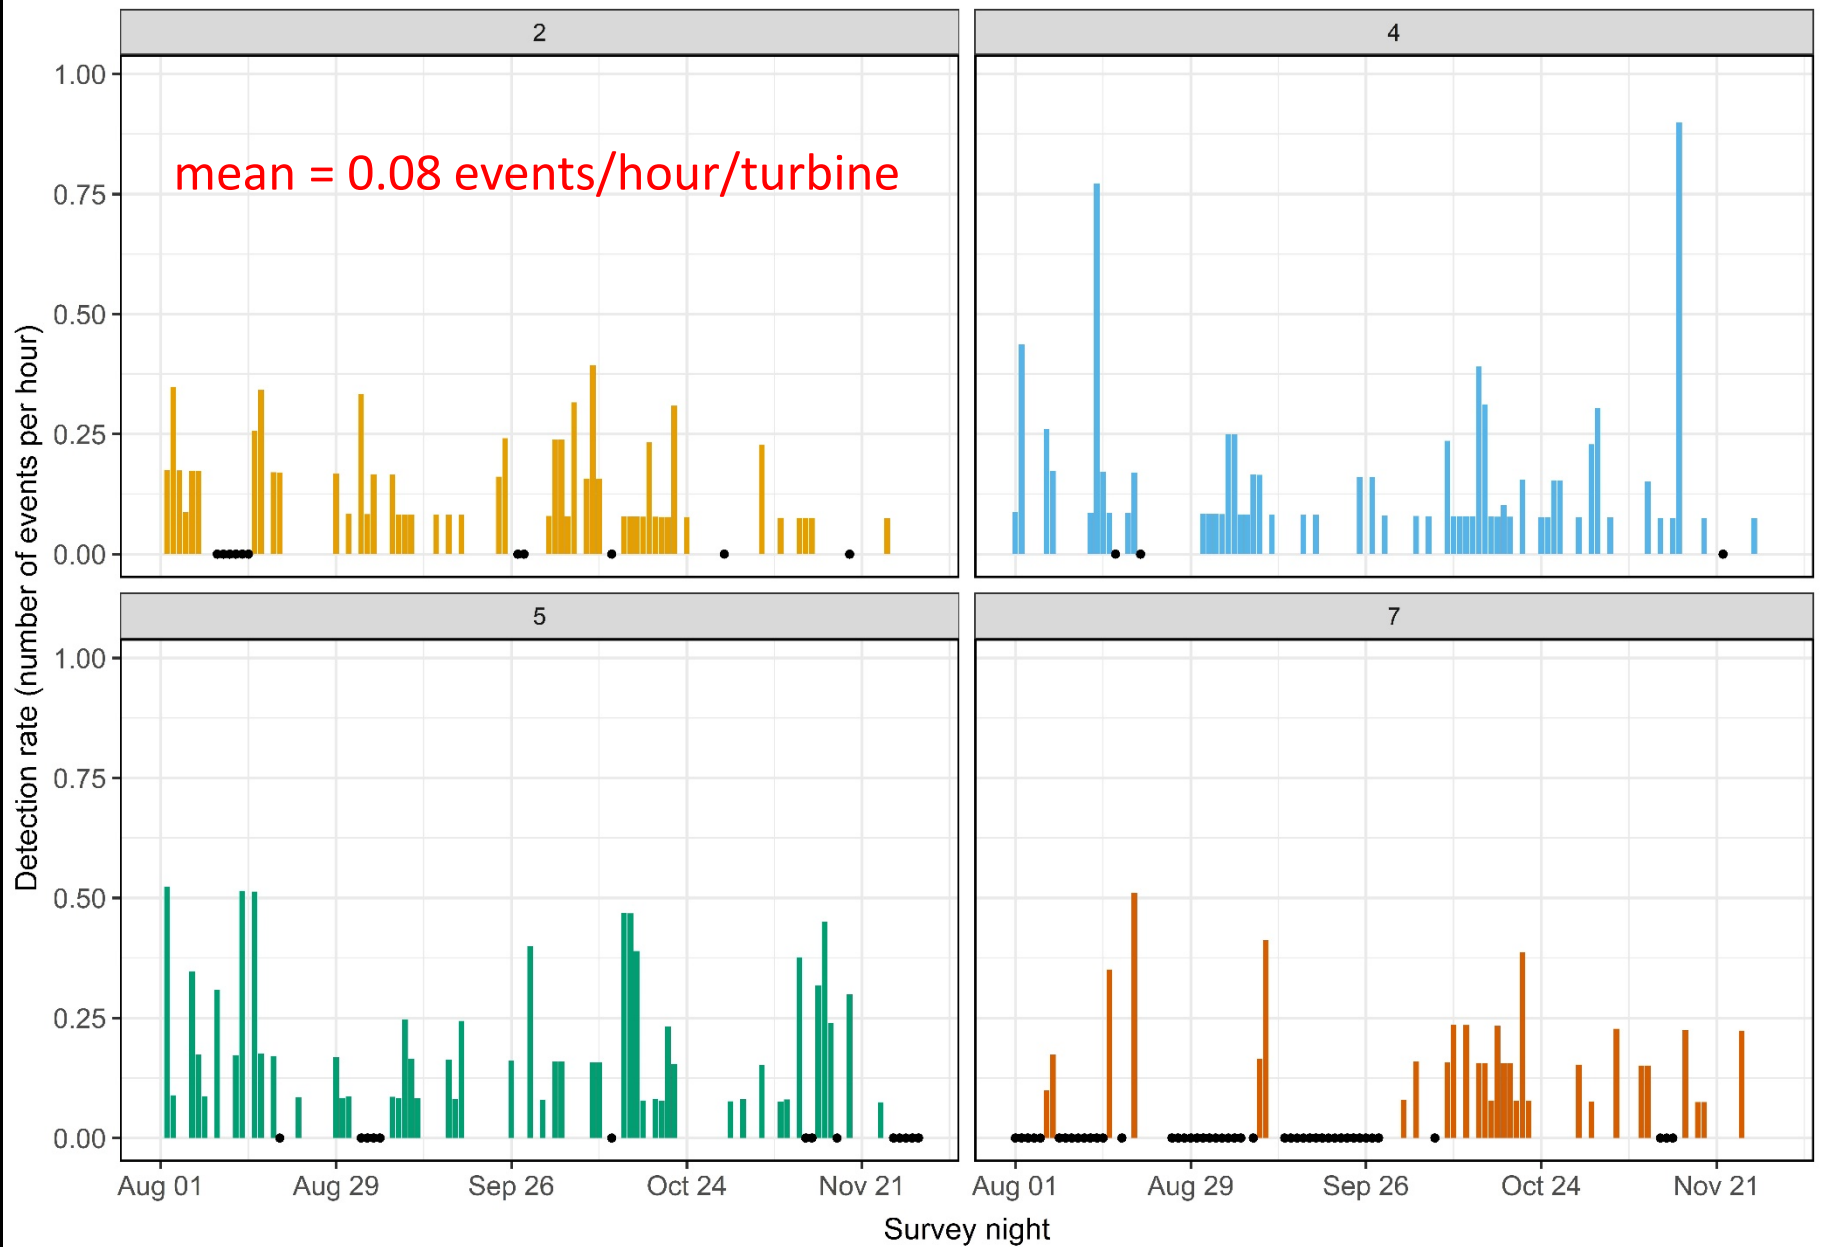

Acoustic
247 turbine-nights
(3,000 hours)

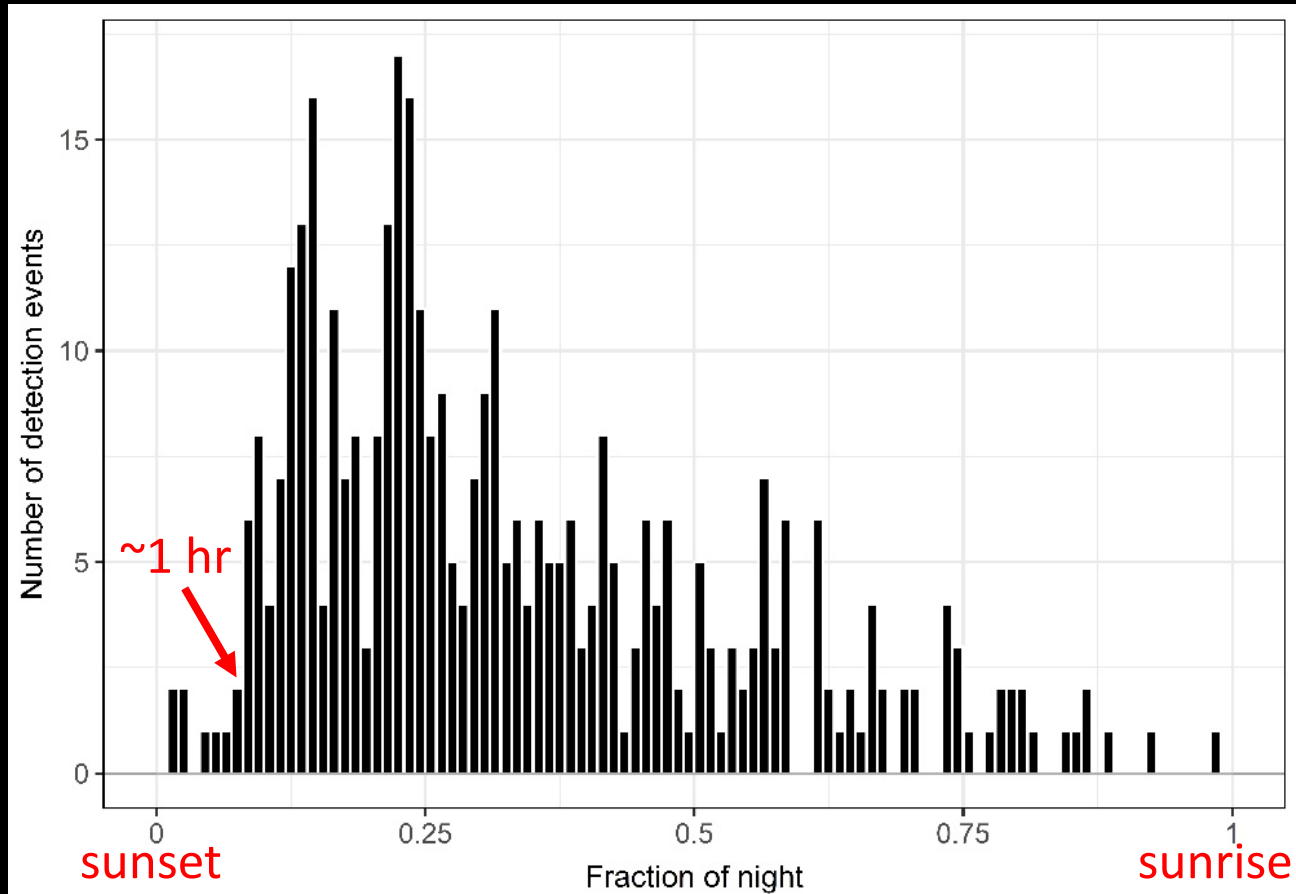

Detection over time

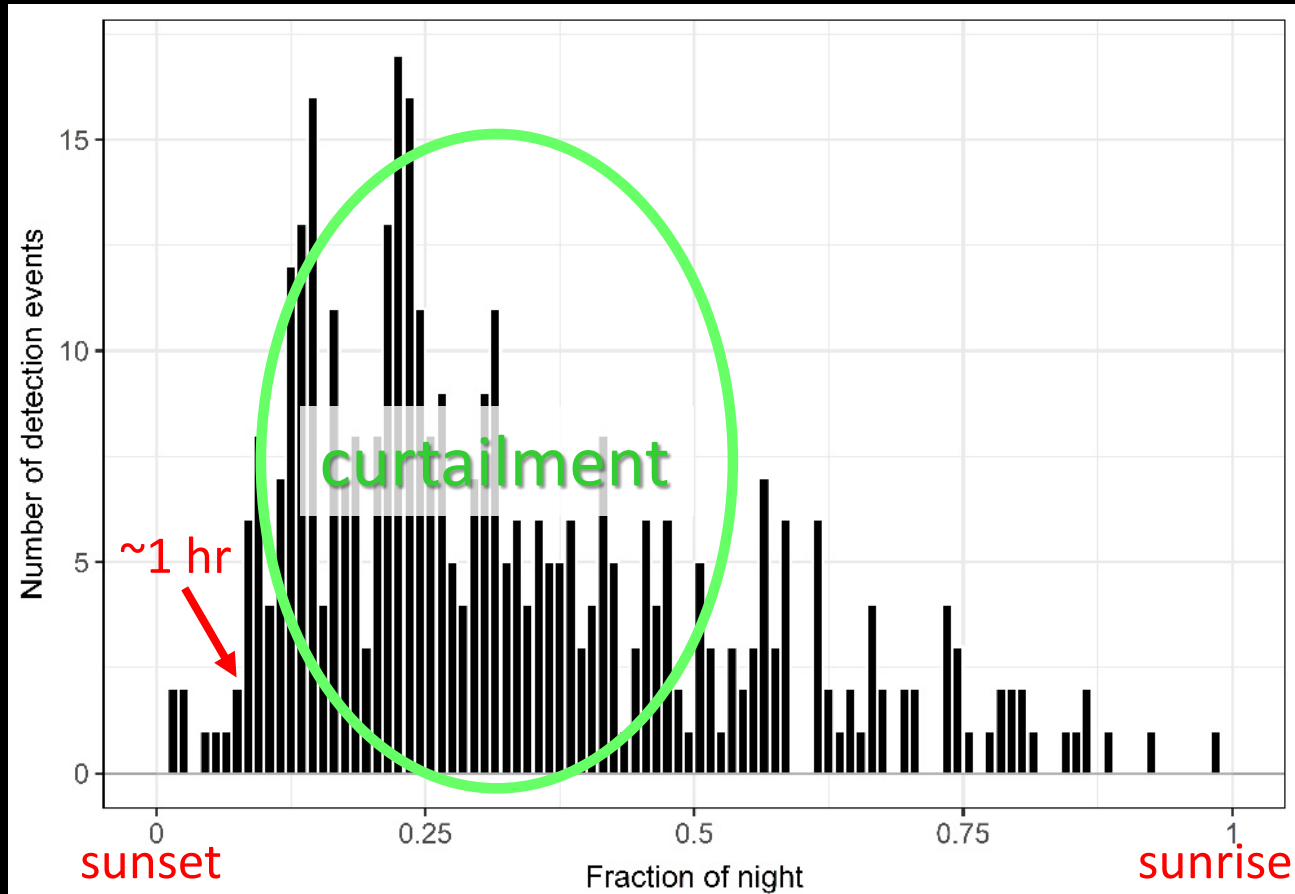

Time of night

- late arrival (>1 hour past sunset); no pre-dawn bump
- $\frac{3}{4}$ detections before middle night
- consistent over Aug-Nov period

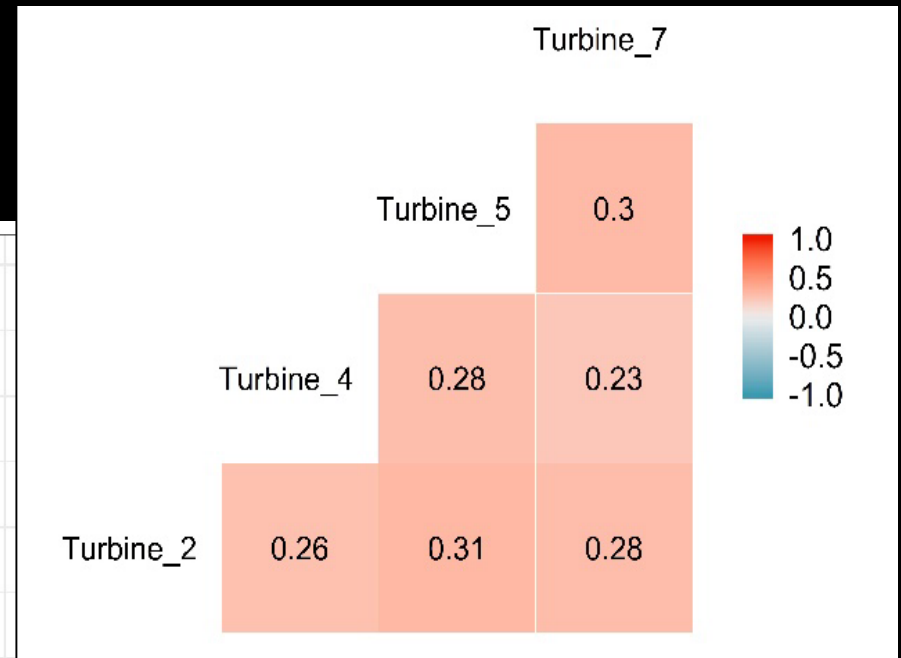

Time of night

- late arrival (>1 hour past sunset); no pre-dawn bump
- $\frac{3}{4}$ detections before middle night
- consistent over Aug-Nov period

Spatial correlation

Temporal correlation

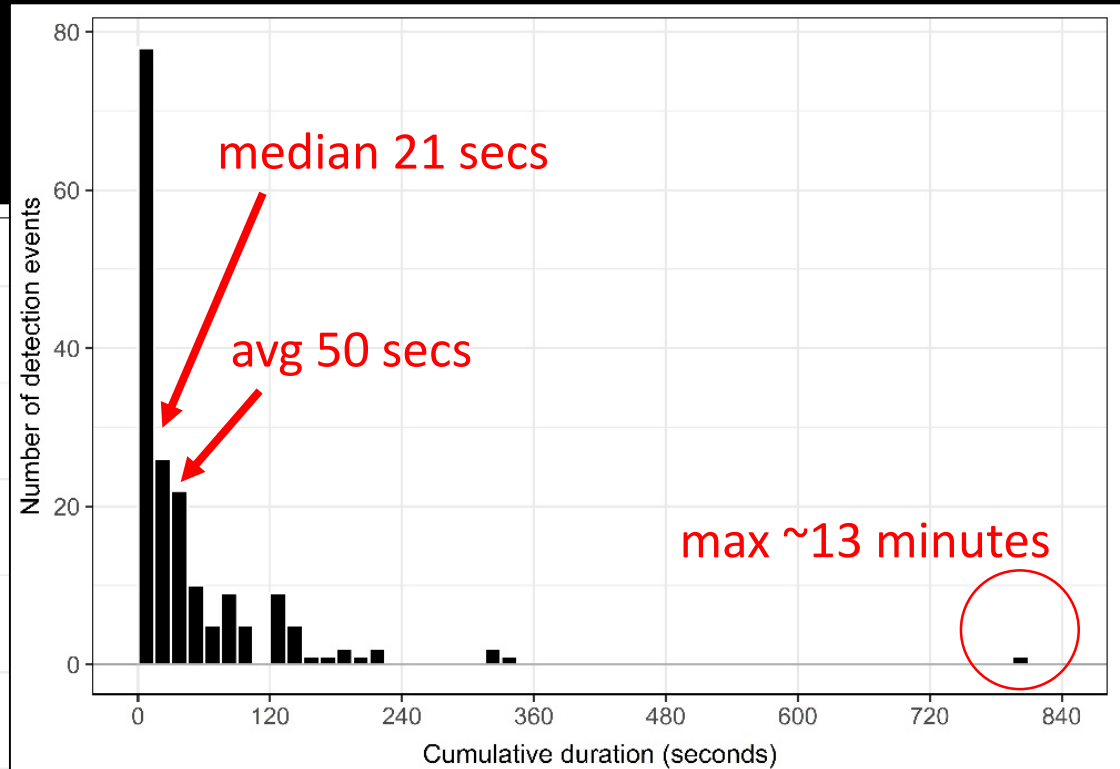

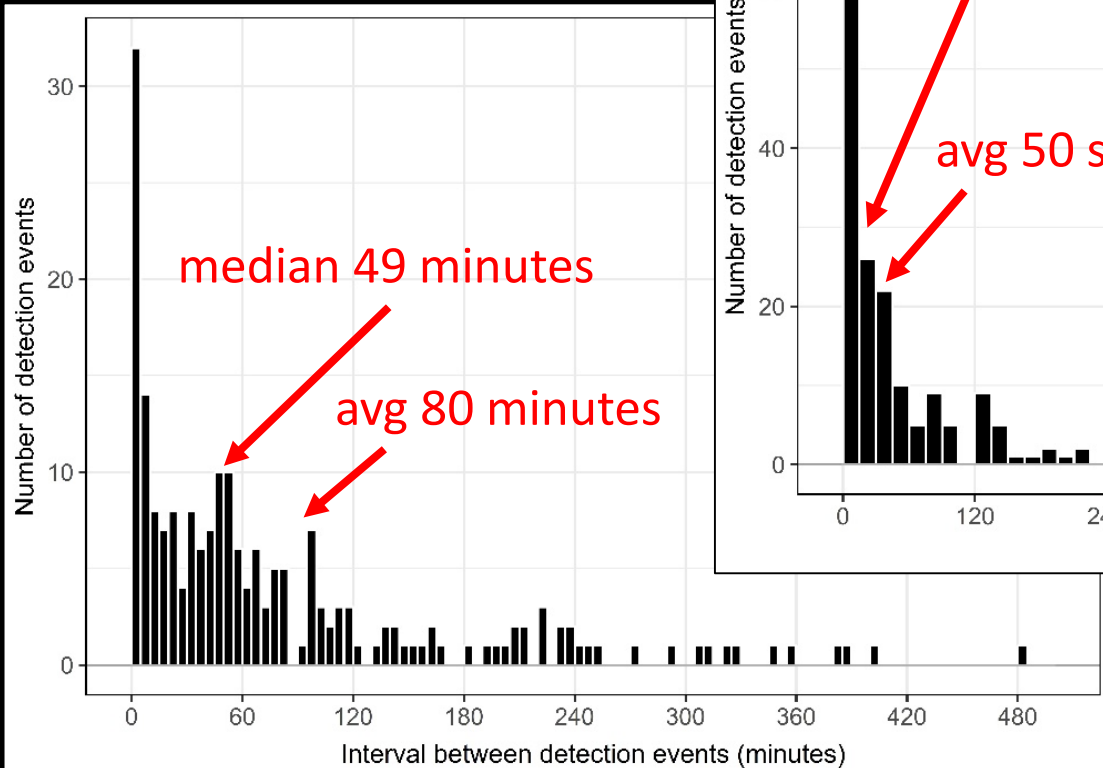

significance thresholds

- weak temporal correlation
- modest spatial correlation

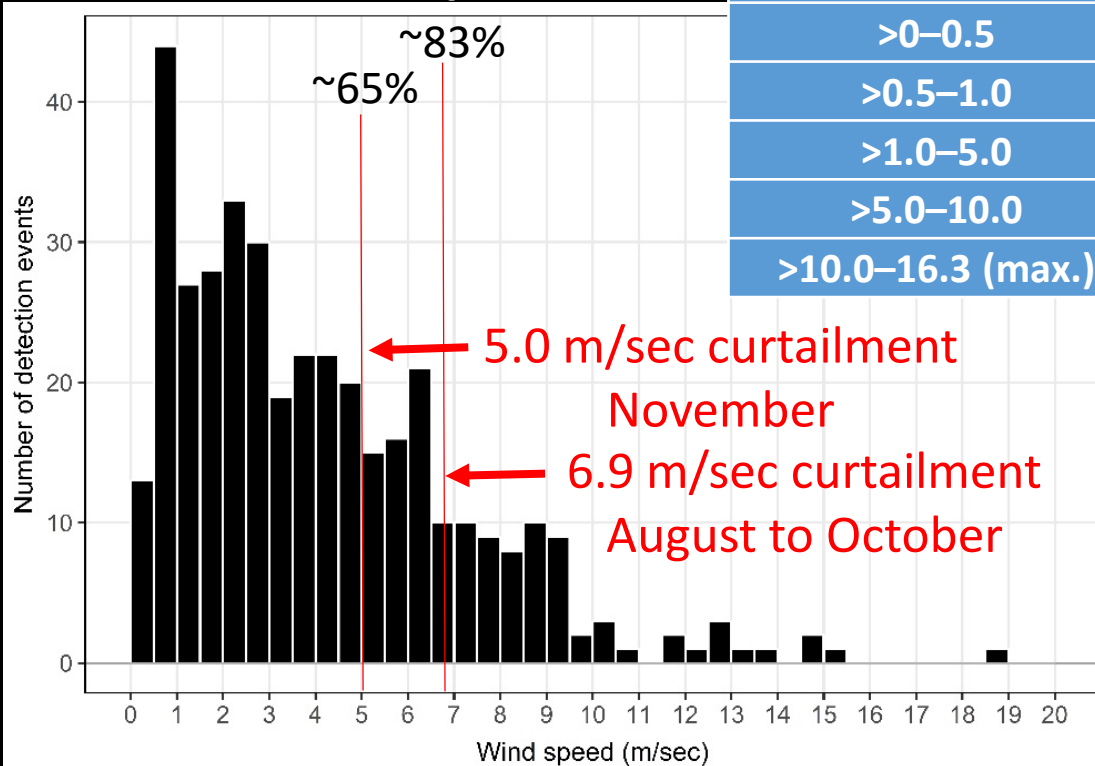

Detection duration

Detection interval

- brief and infrequent detections
- 0.05% total monitoring (2.5 hours of 5,066 hours)

Bat detections and wind speed

Bat detections and turbine RPM

RPM	Number of events	Proportion
0	315	82.0%
>0–0.5	35	9.1%
>0.5–1.0	4	1.0%
>1.0–5.0	3	0.8%
>5.0–10.0	9	2.3%
>10.0–16.3 (max.)	18	4.7%

**at 0.5 RPM
blade velocity is
2.6 m/sec**

- most detections occurs below curtailment thresholds
- most detections occur at or close to 0 RPM

Acoustic detection at turbines

reliability of acoustic monitoring to determine bat presence

- previous study: bats seen were heard 1/3rd of time
- echolocation detection
 - call strength and peak frequency, “silent” flight
 - bat-mic angle, mic-sensitivity, ambient noise
- concurrent visual (video) and acoustic samples
 - 294 visual detections
 - 10 minute window: 12%
 - 2 hour window: 22%
 - 65% bats flying within 15 m of nacelle

Ultraviolet light deterrents

Marcos Gorresen — Hawai'i Cooperative Studies Unit — UH Hilo
Paul Cryan — US Geological Survey — Fort Collins Science Center

Current understanding and minimization

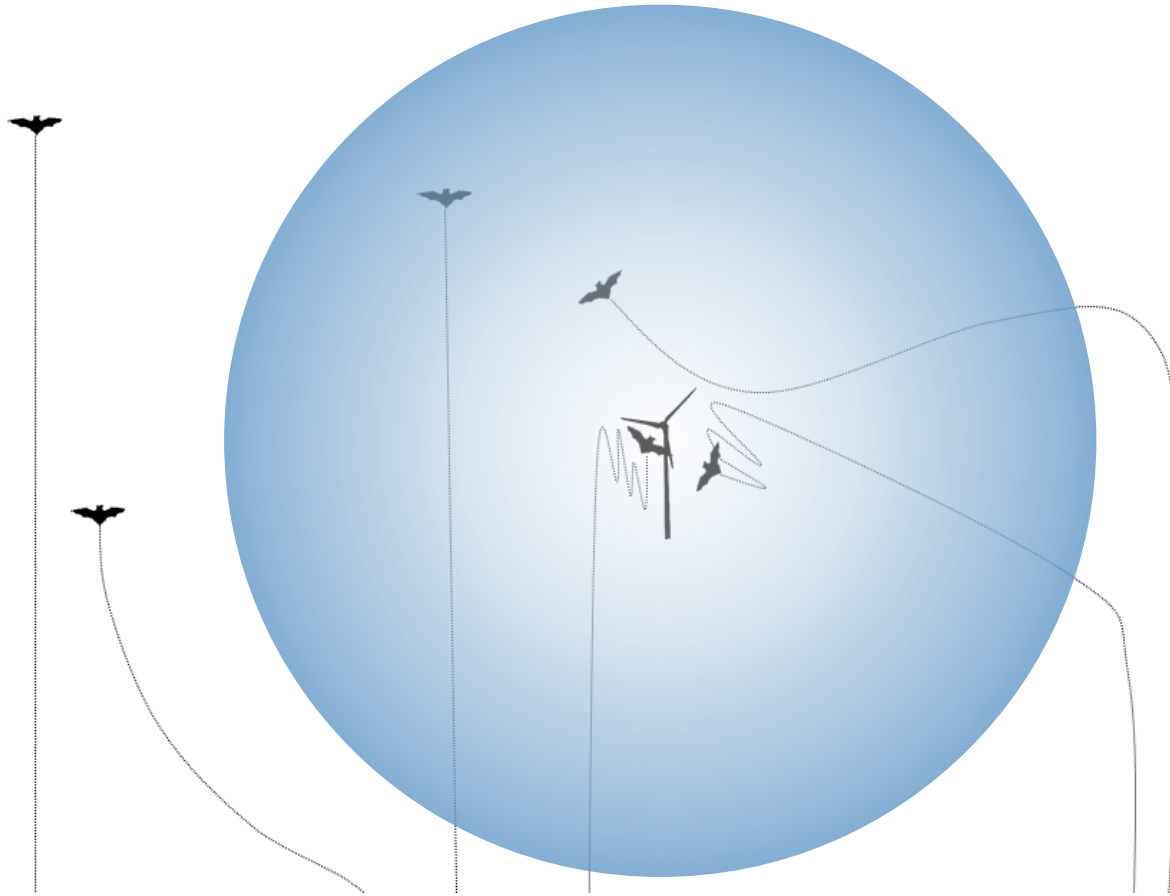

close to turbine

<u>Methods</u>	Fatality searches	Acoustic detectors	Video cameras
<u>Minimization</u>	Curtailment	Acoustic deterrents	Texture modification

If fatality minimization is moving forward before understanding
cause at observable scale, ***why not go bigger?***

Can we avoid possible attraction from **afar**?

How might bats see trees and turbines?

Ultraviolet vision and bats

✓2014: tested & confirmed
7 bat species (3 families)
see dim UV

✓2014: decreased hoary bat
activity by flickering UV on
trees

✓2019: tested prototype UV
light systems on operating
wind turbines

2020: bat response to UV
at wind turbines

Gorresen *et al.* 2015
Ultraviolet vision may be
widespread in bats.
Acta Chiropterologica

Gorresen *et al.* 2015
Dim ultraviolet light as a
means of deterring activity by
the Hawaiian hoary bat
(*Lasiurus cinereus semotus*).
